## A FURTHER CONTRIBUTION TO THE STUDY OF EPIDEMIC ENCEPHALITIS IN ITS RELATION TO POLIOMYELITIS\*

By M. NEUSTAEDTER, M.D., Ph.D., W W HALA M.D., and E J BANZHAF, Ph.D.

NEW YORK CITY

SINCE reports on the epidemicity of Lethargic Encephalitis—so called—began to be recorded, a profuse literature has appeared dealing with the clinical manifestations of this disease and the cytology and chemistry of the blood and spinal fluid. The relation of the affection to Poliomyelitis, although considered in early epidemics by many investigators speculatively, does not appear in the literature on the subject to have been considered experimentally to any great extent, so far as we were able to find.

Amoss (1) has published a neutralization test in *vitro* of poliomyelitis virus with a serum of a patient recovering from Epidemic Encephalitis with a negative result. In collaboration with Drs John Larkin and E J Banzhaf (2) we were able to neutralize poliomyelitis virus in *vitro* in six instances with sera of patients recovered from Epidemic Encephalitis and completely protected the six monkeys experimented upon.

Amoss denies the value of neutralization in *vitro* but against his contention we need only cite such investigators as Landsteiner, Flexner and Clarke Roemer, Netter and Levaditi and others. Besides, his neutralization test in *vitro* covers only one experiment. To us this seems an insufficient number to draw conclusions from.

The results of our neutralization tests in six monkeys so uniformly positive led us to the next problem, namely, the complement fixation of spinal fluids of patients acutely ill with Epidemic Encephalitis in the presence of poliomyelitis antigen, since we have already had good results with complement fixation tests of spinal fluids of Poliomyelitis patients with this specific antigen. That work was published in 1916 (3).

For this purpose we have investigated 106 spinal fluids of frank and suspected cases of Encephalitis. This work we have carefully controlled with spinal fluids of other pathological conditions, and also of Poliomyelitis patients and of monkeys infected with Poliomyelitis, of normal monkeys, and also with fluids of normal human cases.

Since the antigen was prepared from brains and cords of monkeys, which had been infected with Poliomyelitis virus and succumbed to this infection, we have also controlled our work with an antigen from normal brain prepared in the same manner as the one from the infected brain. In addition, all our fluids were subjected to the Wassermann and gold colloid reactions.

The work was done by Mr T Janke, the technician of the Kings County Hospital, under the supervision of its Director, Dr W W Hala. The antigen was prepared by Neustaedter, in collaboration with Dr E J Banzhaf, in the Serum Division of the Research Laboratories of the Department of Health New York City. Dr Banzhaf is the Director of this Division.

The work was further controlled in other laboratories. Dr Garbath tested the spinal fluids of the cases in the Lenox Hill Hospital and the same results that we had with them in the Kings County Hospital Laboratory. Dr William C. Thro reported positive results in a few frank cases. Dr Cornwall reported positive results in two of our positive fluids. Dr Netter, of Paris, to whom the antigen was sent, reports positive fixations in four fluids, but in one, diagnosed as Tuberculous Meningitis. Drs Kaliski and Hadjopoulos report negative results.

The method of procedure in testing the fluids pursued by our technician was as follows:

\*Read at the Annual Meeting of the Medical Society of the State of New York at New York City May 22 1923

# TECHNIQUE OF THE COMPLEMENT FIXATION TEST FOR LETHARGIC ENCEPHALITIS

A set of five tubes is arranged and the various ingredients distributed in the following order and amount

	Tubes for the actual test of specificity			a/c control for antigen	a/c control for spinal fluid
	1	2	3	4	5
1 Spinal fluid	0.20 cc	0.10 cc	0.05 cc	cc	0.20 cc
2 Antigen dil 1:5	0.10 cc	0.10 cc	0.10 cc	0.10 cc	cc
3 Complement dil 1:10	0.10 cc	0.10 cc	0.10 cc	0.10 cc	0.10 cc
4 Mix them by shaking, incubate either in dry incubator at 37.7°C for two hours or in a water bath at the same temp for one hour only					
5 Add the hemolytic system					
Hemolysin	0.10 cc	0.10 cc	0.10 cc	0.10 cc	0.10 cc
Red blood cells, 5% suspension	0.10 cc	0.10 cc	0.10 cc	0.10 cc	0.10 cc
6 Put them back into the incubator until control tubes 4 and 5 clear					
7 Reading	Fixation in tubes 1, 2 and 3 is the strongest reaction + + + +. Fixation in the first two tubes with partial fixation in the third is + + +, without partial fixation in the third is + +. Fixation in the first tube without partial fixation in the second tube is +. Partial fixation in the first tube is ± doubtful.				

## NOTES, EXPLANATORY

1 *Tubes showing positive reactions* are re-incubated for one or two hours, the final readings are made next morning, the tubes having been placed in the ice box over night

2 *Spinal fluid* This should be tested in its fresh condition, 1 cc, not over two days old, and should always be kept in the ice box. Old fluids gradually become anticomplementary, then they should be heated for twenty minutes at 55°C in a water bath before using. Heating, however, reduces their specificity

3 *Antigen* This consists of a Berkfeld filtrate of a 10 per cent suspension of brains of monkeys inoculated with Poliomyelitis virus, to which 2 per cent trypsin is added and left at room temperature for three hours. At the end of this time, 0.4 per cent tricesol is added. 0.10 cc of a dilution of 1:10 of the fresh antigen is used and when four weeks old or more at 1:5 dilution is used in the test proper, as shown above. This amount represents enough antigenic value and is usually  $\frac{1}{4}$  the anticomplementary value. However, the antigen should be titrated once a month and the dose fixed accordingly, and it may be observed that it may be used so as to contain  $\frac{1}{2}$  or less of the anticomplementary dose.

*Antigen unit* The unit of antigen is the smallest amount of antigen that, with two units of homologous serum, 0.1 cc spinal fluid has given a + + + + reaction (complete fixation of complement)

*Anticomplementary dose* The anticomplementary dose is the smallest amount of antigen that is in itself anticomplementary or inhibitory

# ANTIGEN TITRATION FOR ENCEPHALITIS FIXATION

Tubes	Spin Fluid +++ Posit	Poli Antigen Diluted 1:10	Compl ement 1:10	Salt Sol 0.9%	Incub ation	Sensit Sheep Cells	Incubation
1	0.1 cc	0.25 cc	0.1 cc	0		0.2 cc	
2	0.1 "	0.20 "	0.1 "	0		0.2 "	
3	0.1 "	0.15 "	0.1 "	0.05 cc		0.2 "	
4	0.1 "	0.1 "	0.1 "	0.1 "		0.2 "	
5	0.1 "	0.05 "	0.1 "	0.15 "		0.2 "	
6	0.1 "	0.025 "	0.1 "	0.2 "		0.2 "	
7	0	0.40 "	0.1 "	0		0.2 "	
8	0	0.30 "	0.1 "	0		0.2 "	
9	0	0.20 "	0.1 "	0.05 "		0.2 "	
10	0	0.10 "	0.1 "	0.10 "		0.2 "	
11	0	0.05 "	0.1 "	0.15 "		0.2 "	
12	0.2 "	0	0.1 "	0.20 "		0.2 "	

*In regard to antigen* The amount of antigen that fixes complement completely with a spinal fluid of high antibody content may give an incomplete or no fixation with a spinal fluid of low antibody content. Thus in making diagnostic tests, where the detection of even a small amount of antibody is desired, it is advisable to use more than one unit of antigen.

4 *Preliminary complement titration* This is made about two hours after the guinea pigs are killed to see that the complement does not hemolyse cells WITHOUT HEMOLYSIN, but does so with hemolysin.

For each guinea pig four tubes are used, according to titre, e.g. Complement diluted, 1:10, amboceptor, 1:100, washed cells, 5 per cent

	Tube 1	Tube 2	Tube 3	Tube 4	Tube 5
Salt sol	0.2 cc	0.25 cc	0.2 cc	0.3 cc	0.4 cc
Red blood cells	0.1 cc	0.1 cc	0.1 cc	0.1 cc	0.1 cc
Complement	0.1 cc	0.1 cc	0.2 cc	0.1 cc	
Amboceptor dil 1:100	0.1 cc	0.05 cc			

Tubes 1 and 2 must show hemolysis

Tubes 3 and 4 must show no hemolysis. If a trace of hemolysis occurs in Tubes 3 and 4, the complement is discarded.

Tube 5 controls the salt solution and must show no hemolysis

5 *Preliminary titration of Hemolysin* This is titrated roughly at first to determine approximately the proper dilution, subsequently more accurate dilutions are made. The usual hemolysin will be under 1:4000 and more than 1:100, 1:100 may be the average. Therefore, the following dilutions 1:100, 1:200, 1:500, 1:1000, 1:2000 and 1:4000 are used in six tubes, each tube getting 0.1 cc of these respective dilutions of hemolysin and to those are added into each tube 0.1 cc of complement diluted 1:10, 0.1 cc of a

5% suspension of washed red blood cells and 0.2 cc of a 0.9% salt solution. These mixtures are then incubated in a water bath at 37.5° C for thirty minutes. This titration will show which dilutions are required for the final titration in order to find the unit of hemolysin.

### FINAL TITRATION OF HEMOLYSIS

In this titration the complement remains constant while the hemolysin varies. The result is obtained from the preliminary titration of hemolysin, in which varying dilutions are made either from 1:500 to 1:1000, or from 1:1000 to 1:2000.

In the final titration, 51% to twelve tubes are used, into each of which is pipetted 0.1 cc of hemolysin in the desired progressive dilutions 0.1 cc complement diluted 1:10 0.1 cc of a 5% suspension of red blood cells and 0.2 cc of a 0.9% salt solution. These mixtures are incubated in a water bath at 37.5° C for thirty minutes and then read.

The tube showing complete hemolysis in highest dilution is considered the unit of hemolysin

In summarizing the results as shown in Table 1 we find that in 16 we had a ++++ reaction, in 8 a +++, in 23 a ++, in 25 a +, in 14 a  $\pm$  and 20 were negative. Of these one proved on autopsy to be a cerebellar abscess, one a brain abscess, one, on operation a brain tumor two spinal cord tumors three syringomyelia, one proved, on autopsy, a traumatic meningeal hemorrhage, three were tertiary lues, and in one positive case of Encephalitis, clinically, the fluid was bloody. One +++ case proved, on autopsy, a brain abscess.

In Table 2 there are shown tests with the specific Poliomyelitis antigen of twenty-six spinal fluids of cases clinically presenting symptoms of tertiary Syphilis. In all cases, excepting one, they were negative with the specific antigen. In the one instance there is a ++++ Wassermann, but

Table 1

[illegible]

+ with the Polio myelitis antigen. It may be that that lipid in our antigen was responsible for the one +.

As further controls there are shown on Table 3 spinal fluids of clinically and pathologically proven cases of Tuberculous Meningitis. All of them were negative with our antigen.

On Table 4 we have five spinal fluids of undoubted cases of Poliomyelitis and with the exception of one, all were positive with the specific antigen. Of the four spinal fluids of monkeys infected experimentally, with Poliomyelitis two proved positive and two negative. Of the two spinal fluids of normal monkeys, both proved negative.

On Table 5 we show fifty-eight spinal fluid records of various pathological entities and normal cases. In addition control tests were made on over 150 more spinal fluids of diverse conditions other than suspected Encephalitis. These

temperature it would drop to 100, but rose again to recede with the next injection. When the temperature would go to normal it would stay normal and the treatment stopped, providing that the general condition was improved. The lethargy was invariably improved with the second injection. The other symptoms receded slowly, but the recovery in all was prompt. Of the twenty-three cases, nineteen recovered completely without any sequelae.

One with hemiatrophy and paralysis of the left tongue, which was well established when the case was first seen, one a psychosis extremely maniacal, improved after two injections, became quiet and fairly rational, did not refuse food, but the husband refused any further treatment. She is still in the State Hospital. One case of a postencephalitic Parkinson, one and a half years after the onset, still ran a temperature and was unable to get about or even feed himself. He has received eight intravenous injections. When I last saw him before he left the Lenox Hill Hospital, he was walking briskly about the ward with a smiling face. He even could run and stop at will. His improvement began with the third injection. His Parkinsonian features, however, he retained to some extent. We have tried this treatment in a well-established organic case with a great deal of reluctance, for we feel that the serum, in order to be effective, should be administered at the earliest possible moment in the acute stage. There can be no treatment that would modify organic changes in the central nervous system. In this particular instance we intended to stop the constant progress of the disease and this, it seems, we have accomplished.

One case of a postencephalitic Parkinson with a left hemiparesis, a toxic psychosis, in a woman 45 years, still under observation in the Kings County Hospital, has been markedly improved after five injections. She was under observation for three weeks before the serum therapy was begun. During that time seemed to slide downward. Her temperature was never above 102° F. After the first two injections the temperature dropped to 99° and continued under that line. Her lethargy disappeared after the fifth injection and the paralysis and Parkinson features began to recede. Two weeks after the last injection, she sat up in bed, smiling and claiming that she felt well. She is still at the hospital under observation. There seems still a slight Parkinson facies. We would, therefore, call this an improved but not cured case.

Of the twenty-three recovered cases, one received eight, two, six, three, five, nine, four, six, three, and two, two injections.

As a control, three cases, one of them a girl of 12 years of age, with choreiform movements in the upper extremities and + fixation in her spinal fluid, were treated with normal horse serum. Each adult patient was given five intravenous injections of 20 cc in twenty-four-hour intervals. The girl has received five injections of 10 cc each. One of the adults died two weeks after the last injection, one recovered with a Parkinson syndrome and the chorea child recovered, not completely, six weeks after the last injection. She has left the Hospital and her condition is last reported as good. These three cases were treated in the Kings County Hospital.

As a further control, fourteen cases were observed under the ordinary palliative measures of therapy, all in the Kings County Hospital. They were all serious or alarming cases. Of these, nine died and five recovered. The convalescence of all these cases was markedly protracted and in majority of them there were some sequelae of a permanent nature.

We might add that 200 cc of this immune horse serum were recently sent to Dr. Netter, in Paris, who reports that he has administered six injections to a child suffering from Encephalitis with spinal symptoms. The result, he states, was very gratifying and that he was much encouraged.

#### CONCLUSIONS

From the above results we infer that—

1 The Poliomyelitis Antigen fixes complement in spinal fluids of patients ill with active Encephalitis Lethargica, and might be looked upon as a criterion in the differential diagnosis of obscure cases.

2 In the absence of a specific therapy, the immune Anti-poliomyelitis Horse Serum may prove of service, if resorted to early.

3 The positive neutralization tests and fixation seem to constitute two links in the chain of evidence that suggest an extremely interesting possibility that Poliomyelitis and Epidemic Encephalitis are due to variations of the same etiological factor.

# HISTORY, CHEMICAL AND PATHOLOGICAL FINDINGS OF TWO CASES OF FULMINATING SYPHILIS\*

By EDWARD LIVINGSTON HUNT, MD and LEILA C KNOX, MD

NEW YORK CITY

THE following two cases were observed for several weeks at St. Luke's Hospital in New York, and, finally, were autopsied there by Dr. Leila C. Knox. They are, therefore, complete from a clinical laboratory, and pathological standpoint. They are reported at the same time because of the many points which they have in common. In neither case was the diagnosis made during life, in neither case did the laboratory reports give any inkling of the etiology, in neither case did the history prove of any value. The course of each was short, the development rapid and the autopsy findings surprising and conclusive. The microscope, to the surprise of all, proved as we shall demonstrate to you, that the lesion in each was syphilitic.

One was a white man of forty-eight, who died after a six weeks' illness with what was thought to be encephalitis, and proved to be a specific cerebello pontine angle gumma, the other was a colored woman of thirty-eight who died after a few months illness with what was thought to be simply perimeningitis hemorrhagica interna and which proved to be a case of syphilitic parenchymatous degeneration.

I will now in a few words describe the man's symptoms, then give you a short account of the woman's case, after which Dr. Knox will throw upon the screen slides illustrating sections of both brains.

## MALE—CASE 1

This patient was 46 and entered the hospital on July 23 1920. His chief complaint was anesthesia of the right side of the face, of six weeks' duration. His minor complaints, all of a few days' duration, were dizziness, nausea and difficulty in walking.

An extract taken from the history at the time of admission reads as follows:

Present illness. Six weeks ago patient began to notice anesthesia and paresthesia about the submental and infraorbital regions with a sensation of pain in the ear and a slight motor paralysis of the facial muscles. During the last week there has been some difficulty in muscular conduction on the right side, and a sensation of dizziness without loss of consciousness. The patient has vomited three or four times in the last few days, the vomitus consisting of unchanged food. Sleep has been normal. There has been some disturbance of speech, and a sensory hemi-paralysis of the tongue (right). Hear-

ing on both sides is normal, and there is no history of chronic ear trouble. No cardio-respiratory, genito-urinary, or gastro-intestinal symptoms. No headache, nor oculomotor paralysis.

Past History. Negative, except for alcoholism. Syphilis was persistently, and I believe honestly denied. The patient was married and the father of two healthy children.

The physical examination made upon admission did not reveal much. The patient seemed well-nourished, with a flushed face covered with profuse perspiration and gave the appearance of one seasick. The pupils, eye grounds and fields of vision were normal. Lateral nystagmus was present. Caloric tests gave negative results. There was complete hemianesthesia of the right side of the face, tongue, and corresponding mucous membrane. There were no pathological reflexes. There was no cranial nerve involvement. Apart from these findings, the examination was negative.

An X-ray of the head showed that the more anterior cells on the left side were less well defined indicating the possible presence of a sclerotic process.

The laboratory reports, including blood, urine, and spinal fluid were negative. The fluid was under slightly increased pressure, the cells numbered 2. The colloidal gold curve was 1 15 15.2 - 15 10 50000.

The patient improved slightly, then developed ataxia, diplopia, a tremor of the right hand, strabismus, twitchings and some disturbance of speech.

The temperature on admission was 100 and until August 27 ranged between 98 and 99. On the 27th it rose to 103-105, dropped again on the 30th to 99 where it remained until the 6th, when it shot up abruptly and rose to a terminal of 105 on the first of September.

About August 10th the patient grew worse. Repeated lumbar punctures were normal. Reflexes remained unchanged.

In view of the irregularity of the temperature, the eye signs, the twitchings and the negative laboratory findings the diagnosis was regarded as being encephalitis.

## FEMALE—CASE 2

This patient was 39 and entered the hospital on January 7, 1920. Her chief complaints were nervousness, attacks of unconsciousness, and convulsions.

\*Read at the Annual Meeting of the Medical Society of the State of New York at New York City May 22 1923.

An abstract of her admission history follows five years ago the patient developed nervous prostration, characterized by weakness and nervousness. At this time the slightest excitement could precipitate her into a state of unconsciousness in which she could hear but not speak. On these occasions her throat felt constricted. Previous to admission she had been working hard and noticed that her strength was failing.

"A year ago she had a second attack of prostration. Since then she has been subject to these nervous spells. Three weeks ago she experienced a very severe spell in which she had several convulsions and for ten days was unconscious."

There is nothing unusual in either her past or family history. She was married, had never been pregnant, and denied both alcohol and syphilis.

The physical examination was negative. The urine was negative. The blood showed a slight degree of anæmia. The fundi were negative. The blood pressure was 104/85. The urea nitrogen was 14.7, the blood sugar 100. The Wassermann was negative. The temperature was normal.

On January 12 a lumbar puncture was performed, which, being contaminated with blood, was unsatisfactory, but the Wassermann was negative, and the gold curve only one of slight irritation. Following this puncture she had a general convulsion.

On January 18 all the tendon reflexes on the left side became more pronounced than those on the right, and there was a definite left-sided Babinski and Chaddock reflex present. Following the convulsion, there was temporarily complete motor aphasia. The mental condition then began to deteriorate, there was childish euphoria, and incoherence, accompanied by convulsions, stertoroid movements, and rigidity of the neck. The temperature rose on January 12 to 102, and did not return to normal until February 1.

On February 11 a lumbar puncture showed cells 82, lymphocytes 100 per cent, butyric positive, Wassermann negative, and a slightly irritative gold curve.

On February 18 the temperature again rose to 102, the patient had repeated convulsions, and the mental condition became one of continuous euphoria.

From then until the date of her death, which was March 10, the patient was maniacal. She had several convulsions. Repeated Wassermann tests in both blood and spinal fluid were negative. The cell counts were always increased, and the gold curve one of slight irritation. The temperature during the last month fluctuated between 99 and 105. She finally died following a severe convulsion.

## PATHOLOGICAL FINDINGS

The post-mortem examination showed an early cirrhosis of the liver and a moderate degree of myocardial degeneration, as well as a large cerebral lesion superficially suggesting a neoplasm, but found on microscopic examination to be a gumma.

The lateral ventricles were much distended, the convolutions moderately flattened, and the sulci correspondingly shallow. The meninges over the vertex showed no lesion, but on the right side of the base there were fresh vascular adhesions between them and the brain substance at the cerebello-pontine angle. The roots of the trigeminal and auditory nerves were entangled by the growth.

Section of the brain showed extensive destruction of the brain tissue and its replacement by a soft, yellowish cystic mass nearly three centimeters in diameter. This extended deeply into the pons, brachium pontis and cerebellum, reaching to the median line and anterior end of the former and through two-thirds of the latter. There was no trace of a capsule, a broad band of vascular granulation tissue surrounding the cystic and necrotic central portion and separating it from the normal tissue.

Microscopic sections from many areas disclosed the fact that no tumor was present, but that the mass was granulomatous. The center is composed of a necrotic glial reticulum with many pyknotic nuclei and a mass of dilated and thrombosed blood sinuses. The borders of the lesion illustrate the nature of the process and show that there is an endophlebitis and endarteritis obliterans. There are very large numbers of round cells and plasma cells filling and distending the perivascular lymph spaces. These cells also penetrate the adventitia of both veins and arteries, greatly thickening the walls and therefore showing the early and most characteristic lesion of syphilis. The inflammation frequently extends throughout the wall, the endothelium is desquamated and a hyaline thrombus fills the lumen. There is considerable proliferation of glia together with focal necroses. The exudative elements are cells of various types. Many large endothelial cells are present in a state of fatty degeneration, plasma cells and round cells are numerous. The process is not sharply delimited and there is no attempt at encapsulation. An extension of the perivascular infiltration to the left half of the cerebellum and to the branches of the left inferior cerebellar artery has also taken place. Spirochætes have not been demonstrated, but these are frequently not found in late lesions and do not alter the probability that they were the primary cause of the condition.

Solitary syphilomata are not frequent, forming probably not more than three to ten per cent

of the clinical cases of brain tumors. They are being seen even less frequently than formerly in the large hospitals for the insane. The points which help to differentiate such a lesion from a tuberculoma are the fact that it occurred in an adult with no other tuberculous lesions, that judging from both clinical and anatomical evidence it originated at the surface and not deeply within the substance of the brain as would be more characteristic of a tuberculoma, that it involved the pons extensively—a site most rare for tuberculosis, that the mass was soft friable and vascular with no limiting area of fibrosis such as is almost invariably present around a solitary tubercle, the wide area of fresh granulations and the absence of Langhans' giant cells. The vascular lesions which may also occur in tuberculosis are probably much less constant and show less uniformity.

#### PATHOLOGY

The pathological changes which presented themselves on removal of the calvarium left little doubt that the lesion was parietic. There was an extensive recent as well as old pachymeningitis hemorrhagica interna with fresh clots lining the dura and thickening it as well as rusty brownish foci resulting from earlier hemorrhage. The lepto meninges were lifted up by accumulations of serum which filled the spaces between them and the shrunken convolutions. The pia arachnoid was so adherent over several frontal and precentral areas that it could be removed only by tearing the substance of the brain. The size of the brain was also greatly reduced, being scarcely larger than that of a child. In the adherent portions of the thickened meninges small nodules could be felt their diameter from one-half to one centimeter. The base was comparatively free from active inflammation although the pons was here also slightly opaque.

The microscopic evidence confirms the gross diagnosis. There is a severe and diffuse meningo-encephalitis. The nodules on the vertex are necrotic and surrounded by cellular and very vascular granulation tissue. The meshwork of the pia arachnoid contains also many plasma cells and large endothelial cells. The vascular lesion affects both arteries and veins, the walls of both being infiltrated with plasma cells and round cells. Large veins are involved throughout in this manner, as well as showing marked adventitial thickening and subendothelial fibrosis. This lesion is by some authorities, as Rieder considered a typical and almost constant manifestation of syphilis in early cases and in children. Since the infection proceeds from without in, the endarteritis or endophlebitis must succeed the adventitial thickening. Barrett has described exactly this picture in the leptomeninges of a

patient in whom the disease proved fatal within eight months after infection, and Krause has demonstrated three similar and as rapidly progressive cases, all with this type of vascular lesion. The brain is an especially favorable site for examining these lesions, as its vessels are not subject to the secondary alterations caused by trauma, changes which may confuse the picture in subcutaneous or otherwise accessible regions.

The devastation of the outer layers of the cortex is widespread and diffuse. No orderly rearrangement of either fibers or pyramidal cell layers can be distinguished, owing to the exudation of lymphocytes and plasma cells, the proliferation of glia the neuroinflammation, the newly formed capillaries and the swollen perivascular lymph spaces crowded with the same types of cells as those seen in the meninges. The importance of plasma cells as described by Alzheimer and others is emphasized by Kraepelin who regards them as more constant and numerous at a distance from the blood vessels in paresis than in any other disease. Only a very few, and these in the Virchow-Robin spaces are seen in encephalitis lethargica. Mast cells though usually present have not been seen in this case. The tangential layer cannot always be differentiated from the cellular exudate in the pia. This continuity of the process from membranes to parenchyma, together with the distribution and severity of the process, the presence of gummatous nodules, the plasma cells in the cortex and the vascular lesions, are ample evidence that the lesion is parietic.

Kraepelin believes that in women this demented form of paresis is relatively more frequent than in men but holds, as do most writers that the incidence of the disease in general among women is still much less than among men perhaps from one half to one-fifth as frequent. In Europe the number of cases among women is thought to be increasing. In this group the greater number of young adults are found and among the negroes in this country there is also an increasing number of cases in the female portion.

# THE VALUE OF THE COMPLEMENT FIXATION TEST IN GONORRHOEA IN WOMEN.\*

EMILY DUNNING BARRINGER, M.D., F.A.C.S and EDDA VON BOSE, M.D.

NEW YORK CITY

**T**HE following study of the complement fixation test in women has been worked out on my service in the gonorrhœal wards of the Kingston Ave Hospital, Department of Health, New York City. Dr Edda Von Bose, as resident physician to the Venereal Service, has personally followed all of these cases during their period of treatment in the hospital, and we together have collaborated the following observations in regard to the clinical value of this test.

The report of the purely serological and bacteriological side of the investigation which has been carried on by Miss M. A. Wilson and Dr Anna W. Williams, has been published separately.<sup>1</sup>

Certain advantages and disadvantages are at once apparent in regard to the available data of our cases.

We are handicapped in the very beginning by the fact that it is difficult to obtain an accurate history of infection in the type of patient found in this service. As the vast majority are prostitutes, the date of the first onset of infection is almost impossible to obtain. So inaccurate is the information given by these women, that we have come to disregard the history, except in cases of violation, which form a very small percentage.

We have been forced, then, to try to get these cases on admission ourselves, relying on the actual conditions found, rather than the history obtained. Thus we have worked out

et of symptoms which we feel covers the acute stage, the sub-acute, and the chronic stage of the disease, and we classify each new case accordingly on admission.

The other great disadvantage as to the scope of our work is that there is no possible follow-up of these patients at the present time. Immediately after leaving our doors, with a tentative cure, they may become exposed to a fresh infection. Being of the social status that they are, they are not intelligently and vitally interested in a cure. They simply want to be sufficiently well to receive our O. K., and then disappear, and have as few questions asked as possible. Hence the utter impossibility, except in rare instances, of being able to say that a given case remains cured after three months away from the hospital, or whether a reappearance of symptoms means exacerbation of the old infection, or the appearance of a new infection.

So much for some of the disadvantages of our work. The very great advantage is, that, from

the time the patient enters the hospital until the date of her release, we are able to hold her under conditions we can absolutely check off, and here during the days or weeks that the disease is running its course, we are able to study the clinical symptoms, the bacteriological and serological findings simultaneously. We have further had the great good fortune of having all cases considered in this report pass under the same routine investigation, so that the personal equation has been the same throughout.

We have used the following classification of symptoms in designating whether a case is acute, sub-acute, or chronic.

## ACUTE

Cases having one or more of the following symptoms

*Vulva* Active inflammation and swelling of the parts. Involvement of Bartholin's glands with or without abscess formation, but exhibiting some evidence of inflammation in the duct.

*Urethra* Evidence of active inflammation as witnessed by mucopurulent or purulent discharge and swelling of the mucous membrane at the mouth of the urethra, and ability to express a drop of purulent material on massaging Skene's glands.

*Vagina* Inflammation present in varying degrees, mucous membrane swollen, reddened and sensitive.

*Cervix uteri* Presents a swollen and reddened appearance with or without erosions and a mucopurulent discharge.

*Uterus* There may be endometritis or metritis in varying degrees, as evidenced by tenderness or enlargement of the uterus.

*Tubes and Ovaries:* There may be an acute endo-salpingitis without enlargement of the tube, but generally with acute tenderness, or there may be a definite enlargement of the tube. There may be congestion of the ovary, or in virulent cases, active inflammation.

*Perimetritis* May be present in varying degrees, as evidenced by loss of mobility of the uterus.

## SUB-ACUTE

Those cases presenting any or all of the symptoms of the acute stage, but in less intensified form, and showing usually erosions of the cervix.

\* Read at the Annual Meeting of the Medical Society of the State of New York, at Albany, April 19, 1922.

The discharge is free and mucopurulent in character

### CHRONIC

Those cases presenting no evidence of active inflammation and exhibiting some or all of the following symptoms in varying degrees

**Discharge** Slight or profuse, mucopurulent in character

**Bartholin's glands** Evidence of involvement as witnessed by fibrous or cystic change in the gland itself with or without patent duct, and showing purulent discharge

**Urethra** No inflammatory condition apparent. On massage pus may be obtained from Skene's glands or from urethra

**Cervix** May or may not be enlarged. Canal usually unduly patent. Erosions fairly constant. Mucopurulent discharge. Evidence of prior adnexial involvement such as thickened tubes, loss of mobility of uterus, evidence or history of previous pelvic or abdominal surgery.

We have used the Williams rules for smear diagnosis as follows:

1. Positive spreads—those showing leucocytes filled with morphologically typical gonococci, decolorized by gram stain

2. Suspicious spreads—those showing any suspicious gram negative intra-cellular diplococci

3. Observation spreads—those showing 50 per cent or more polymorphonuclear leucocytes, but no suspicious intra-cellular diplococci or those having the clinical symptoms of discharge and inflammation, and showing less than 50 per cent polymorphonuclear leucocytes

4. Negative spreads—those showing less than 50 per cent polymorphonuclear leucocytes, no suspicious intra-cellular cocci and no clinical evidence

All the patients have had weekly bleedings and smears made and these have accompanied the clinical picture throughout their stay in the hos-

pital, and it is the aim of this paper to establish, if possible the practical value to the clinician of the complement fixation test

On reviewing the records, we find that seven groups present themselves for study. They are as follows, based on an analysis of 256 cases, taken at random from the records:

1. Spreads +	CFG +	26 cases
2. Spreads (Neg. or observation or suspicious)	CFG +	59 cases
3. Spreads +	CFG ± or -tr	27 cases
4. Spreads +	CFG -	13 cases
5. Spreads (suspicious at most)	CFG negative	10 cases
6. Spreads (suspicious at most)	CFG ± or -tr or -	116 cases
7. Spreads negative	CFG negative	5 cases
		256 cases

The same group of cases (256) showed that we considered the cases to be

49 sub acute      5 acute      202 chronic

It will be observed that the vast majority of our cases were considered chronic, and fell in Class No. 6 where the spreads at most were suspicious, never positive, and the CFG ± or -tr or -

While our largest number of cases fell under Group No. 6 we consider that Group No. 4 is probably the most interesting group for interpretation

Here the spreads have been positive, and the CFG consistently negative. In trying to account for this combination we have reasoned that perhaps this group might be analogous to a similar group in the male, where the anterior urethra only is involved. Keyes drew attention to this group and Schwartz and McNeil<sup>2</sup> referred to it in analyzing some of these findings in women making the following statement: "We think a negative reaction will probably be obtained if the disease is limited to the urethra, Skene's Glands and Bartholin's Glands."

This opinion does not apply to our group, in that the cervix was involved in all but one case, and the tubes in many of them. See Table I

GROUP IV SPREADS + COMP. FIXATION

Based on Clinical Findings as	Discharge from Urethra	Discharge from Cervix	Involvement of Tubes	Involvement of Bartholin's Glands
1. Chronic	Profuse	Profuse erosion	Negative	Negative
2. Chronic	Negative	Profuse erosion	Negative	Right
3. Chronic	Slight	Profuse erosion	Right	Negative
4. Subacute	Profuse	Profuse erosion	Negative	Negative
5. Chronic	Moderate	Profuse erosion	Negative	Negative
6. ?	Profuse Skene's involved	Negative	Left	Negative
7. Chronic	Skene's involved	Profuse erosion	Left	Negative
8. Subacute	Slight urethra	Profuse erosion	Negative	Negative
9. Chronic	Slight urethra	Moderate erosion	Right	Right and left
10. Chronic	Skene's involved	Profuse erosion	Negative	Negative
11. Chronic	Slight urethra	Profuse erosion	Right and left	Left
12. Chronic	Profuse, urethra Skene's involved	Profuse erosion	Right	Negative
13. Chronic	Slight urethra	Profuse erosion	Negative	Negative

CLINICAL COURSE.

Patient had had a urethritis and mild cervicitis. Later in course had developed an infection of Bartholin's Gland, which was removed. For discharge from hospital she had

Negative and observation spreads  
Clinical findings O K.  
+ Complement fixation.

CLINICAL COURSE

Patient has had a cervicitis with profuse discharge. Had also had one tube (right) involved.

The clinical findings subsided with the complement fixation. For discharge from Hospital Spreads were — and observation. Clinical findings, O K. C F — tr

In studying the weekly readings of the complement fixation records on the ward and following the clinical pictures, we have had in mind that there is a definite relation between the clinical curve and the complement fixation curve. To explain. In our very acute cases the clinical symptoms, fever, leucocytosis, pain and local inflammatory symptoms are at their height at the onset of the disease, and the complement fixation is generally negative, until the third to fourth week when it generally rises. During the sub-acute stage the clinical curve is gradually coming down and for a while the complement fixation is going up or remaining high, and then in the chronic stage the clinical curve and the complement fixation subside together.

We tried to plot such a compound curve but it became so involved that it was not practical. Then we tried to get a curve of six acute cases, ten sub-acute and ten chronic.

The charts of ten curves did not work out well again, and hence we have picked out of each one curve which we consider typical of a sub-acute and chronic case.

We expect, from our observations, to find

when there is an exacerbation of symptoms in an acute case, that there will be a rise in the complement fixation. This is well shown in our chart of acute cases. In the sub-acute cases we expect our largest numbers of high complement fixation readings (per case), and during the sub-acute stage the various involvements of Skene's Bartholin's, cervix, uterus and tubes will occur. In the ideally resolving case, the clinical symptoms will be steadily diminishing, the smears becoming obscure or—(instead of + or suspicious) and the complement fixation coming down to negative. The ideal outcome is to have

Clinical symptoms	Negative
Com fix,	Negative
Spreads,	Negative

This or approximately this, happens so often that we have come to look upon it as the usual outcome of these cases. As the complement fixation does not disappear immediately after the gonorrhea is cured, we cannot from a practical standpoint hold many of our supposedly cured cases until the CFG is negative. We are therefore willing to discharge cases with negative clinical and bacteriological evidence and a complement fixation up to and including 1+. Any case with a 2+ or more complement fixation we hold as potentially uncured though we may not always be able to locate the nidus of infection.

If a case has been progressing well and clinical, bacteriological, and CFG have all been running along together, and the CFG is + or below, and then suddenly jumps to +++ or ++++, we feel that this is suggestive of an exacerbation and if necessary a patient should be held on this finding alone.

## CONCLUSIONS

1 We are willing to make a definite diagnosis of gonorrhea on a  $\pm$  CFG, which we consider a weakly positive reaction, as we are satisfied that a non gonorrheic does not give a positive reaction.

2 The complement fixation test in women has a distinct value, which is greatest in the chronic and sub acute cases from the standpoint of diagnosis and prognosis.

3 It is of less value in acute cases, from the standpoint of diagnosis, but probably equally valuable from the standpoint of prognosis.

4 The subsidence of the complement fixation with the clinical symptoms is proven in this series.

5 The reappearance of a high complement fixation reaction during convalescence suggests an active focus.

6 A persistent negative complement fixation with positive bacteriological findings is rare, and at this date we are unable to explain it satisfactorily.

7 A persistent negative complement fixation with negative clinical and bacteriological findings we believe can be interpreted as an index of the probability of a cure of gonorrhea in women.

8 We suggest as a tentative and entirely arbitrary standard that in order to pronounce a cure of gonorrhea in women, it is necessary to have these three persistent negative findings over a period of six months. We fix this arbitrary time, as we believe the cure in women is probably somewhat slower than in men.

## THE ATTITUDE OF THE MEDICAL PROFESSION OF THE STATE OF NEW YORK TOWARD THE VENEREAL DISEASES\*

By JOSEPH S. LAWRENCE, M.D., and RUSSELL B. TEWKSBURY, S.B.

Director Division of Venereal Diseases

Assistant to the Director

State Department of Health, Albany

THE venereal disease problem has been viewed from many angles in the past few years and statistical studies in great variety and degree of completeness have been made. From our acquaintance with the ground covered, however we believe that but little attention at least in a statistical way has been given to the average physician's attitude toward these diseases. The object of this paper is to show what proportion of the physicians of New York State are looking for syphilis and gonorrhea and to what

extent they are finding and treating them. It was our opinion even before making this study that the proportion of physicians interested had increased remarkably in the last, say, five years, and that an analysis of the situation today would show that a large number of physicians are now awake to the importance of recognizing and treating these diseases.

The Division of Venereal Diseases of the New York State Department of Health has for the last three years received annually, on an average, 10,000 reports of cases of syphilis and 4,000 reports of cases of gonorrhea. A brief description

\*Read at the Annual Meeting of the Medical Society of the State of New York, at New York City May 23 1923

of the manner in which notifications of cases of venereal diseases are obtained is necessary for correct interpretation of this study. First, the various public health laboratories† of the State forward to the Division copies of the information slips accompanying specimens which prove positive for syphilis or gonorrhea. This source provides the great majority of the notifications. Second, notifications are received from venereal disease clinics and the State institutions which report on special information cards provided by the Division. Finally, some physicians voluntarily report directly. For each notification received, the files are carefully searched in order to determine whether the case has been reported previously, and duplicate reports are attached to the original. For this study data has been taken from the positive reports received during 1922

physicians for diagnosis and treatment and only the records of the State Laboratory at Albany were drawn upon for the list of physicians submitting specimens, all of which were negative. If these conditions could be properly evaluated and complete records of negative examinations gotten from all of the public health laboratories it would show that the proportion of physicians interested is much greater than 57.7%. We are fully justified, therefore, in saying that at least 60% of the physicians and surgeons practising in the State are co-operating in the extirpation of the venereal diseases. Sixty per cent is such an unexpectedly large proportion that the figures were analyzed in detail. It was found that the 3,726 physicians could be grouped in the following manner, according to disease reported or suspected

	Number	Per cent of all physicians in directory
Physicians reporting syphilis alone	1,695	26.3%
Physicians reporting gonorrhea alone	298	4.6%
Physicians reporting both syphilis and gonorrhea	499	7.8%
Physicians reporting syphilis, gonorrhea or both	2,492	38.7%
Physicians reporting syphilis	2,194	34.1% (sum of 26.3% and 7.8% above)
Physicians reporting gonorrhea	797	12.4% (sum of 4.6% and 7.8% above)
Physicians submitting specimens not found positive for either disease	1,234	19%
Total number physicians submitting specimens for diagnosis of a venereal disease	3,726	57.7% (sum of 38.7% and 19% above)

and from records received from the State Laboratory of examinations made there for physicians who had submitted no specimens found positive.

During this year 10,046 reports of positive examinations for syphilis and 4,095 reports of positive examinations for gonorrhea were received from the State exclusive of New York City. These reports were all classified according to the name and address of the physician reporting.

It was found that, of the 6,471 physicians and surgeons registered‡ in New York State exclusive of New York City, 2,492, or 38.7%, reported either syphilis, gonorrhea or both during the year of 1922. In addition to this, it was found that 1,234 other physicians, or 19%, submitted specimens to the State Laboratory that were not found positive for either disease, making a total of 3,726 physicians, or 57.7%, known to have submitted specimens. This percentage may be assumed to be a conservative one, for not all of the 6,471 physicians and surgeons are practising, and some, because of specialization, refer all cases suspected of being venereal disease to other

The preponderance of physicians reporting syphilis over those reporting gonorrhea is in a large measure indicative of the degree to which the laboratories are used in diagnosing the two diseases. Many physicians make their own microscopical examinations for gonococci and some diagnose gonorrhea on the basis of the clinical findings or history alone, clinical evidence being more generally relied upon, probably, in the diagnosis of gonorrhea than in the diagnosis of syphilis.

It is an interesting observation that of the physicians reporting gonorrhea (12.4%), but few more than one-third (4.6%) limit their practice, with respect to the venereal diseases, to gonorrhea alone. This is in marked contrast to those physicians reporting syphilis (34.1%), even more than three-fourths, 26.3% of whom have not reported gonorrhea from their practice.

Instructive comparisons may be drawn between physicians reporting cases, as to their residence whether urban or rural. For this purpose all communities with a population of 2,500 or above may be considered as urban, all under as rural.\*

	Urban	Rural	Total
Physicians reporting syphilis alone	1,472	223	1,695
Physicians reporting both diseases	431	68	499
Physicians reporting gonorrhea alone	208	90	298
	2,111	381	2,492
All physicians registered in directory	4,721	1,750	6,471

\* Classification used by U. S. Census Bureau and Division of Vital Statistics of the New York State Department of Health.

† Under "Public Health laboratories" are included all municipal, county, institutional and private laboratories inspected and approved by the Division of Laboratories and Research. The State Laboratory at Albany and its branch at New York City are also included. The Branch Laboratory accepts specimens from territory in vicinity of New York City but not from the city directly.

‡ According to the "Medical Directory of New York, New Jersey and Connecticut 1922," published by the New York State Medical Society. The directory makes no distinction as to physicians and surgeons, hence in this paper the title physician is used to embrace both physician and surgeon.

According to the medical directory it will be seen that of the total 6,471 physicians registered 4,721, or 73%, claim urban residence, while our records show that of the 2,492 reporting cases 2,111, or 85%, are urban. Putting this in another manner, 45% of the urban physicians have reported cases, whereas but 22% of the rural physicians have done so. This well bears out the general observations so often made that most patients in the rural districts, if residing conveniently near to a city will go there for treatment rather than call upon the physician in their rural community.

Analyzing the figures with regard to disease as well as location of practice it was found that 40% of the urban and 17% of the rural physicians reported syphilis while only 14% of the urban and 9% of the rural physicians reported gonorrhea. It is very noticeable that of those reporting a much larger proportion (23%) of the rural physicians are limiting their practice in venereal diseases to gonorrhea than of the city physicians (9%). This variation may be explained in part by a deduction suggested above, namely, that the specialists who do not submit gonorrhea specimens to a laboratory but examine them in their offices, live in the cities, while in the rural districts the physicians are not specialists but general practitioners, who find it easier to take a gonorrhea specimen than a syphilis specimen and prefer to have it examined in an approved laboratory.

The number of co-operating physicians in each county, city and large village was compared with the total number of physicians registered in the 1922 medical directory for New York State as residing in that particular county, city or village. Marked differences in these proportions were found for the different communities. Montgomery County leads in showing the largest proportion of physicians co-operating. Of the 55 physicians registered in that county 94% co-operated 60% having cases and 34% submitting specimens that were all negative. In eight counties 70% or more of the physicians are recorded with cases or as having co-operated by submitting specimens, namely Broome, Clinton Hamilton, Monroe Montgomery Niagara, Onondaga and Warren. If the records of negative examinations made by the Public Health Laboratories of Buffalo were available it is quite probable that Erie County would be included in this group.

The weakest co-operation was manifested by Tioga County where only two of the 40 physicians reported cases and five others submitted specimens, all of which were negative. Livingston County was a close second. The most plausible explanation to us for this indifference is their lack of ready laboratory service.

In Table I the ratio is shown according to counties.\*

The chief value of these tables is limited to the records of positive cases, complete reports of which have been received from all laboratories, while negative examinations were reported only by the State laboratory at Albany. However, work is done in this laboratory for all parts of the state, and many counties having no laboratory of their own, have all their specimens examined here. Negative records have therefore, a suggestive value except from certain counties where efficient laboratories are locally operating, as Albany, Cayuga Erie etc. As concerns such counties and cities the figures employed in these tables may understate the degrees of co-operation extended by the physicians, but in no instance will they overestimate it.

Table II gives the ratio that holds in the cities.\*

The three first-class cities of the State display practically the same proportion of physicians reporting with respect to syphilis—44% for Buffalo, 45% for Rochester and 46% for Syracuse. This is to be expected since conditions for the practice of medicine are about the same in the three cities. It will be noticed that practically no gonorrhea was reported from Rochester. Owing to a misunderstanding, the local laboratories, where all of the gonorrhea examinations are made, did not report their results to us.

It will be seen that in not a few cities where approximately complete records were at our disposal, every physician is recorded with co-operation. In 29 of the 54 cities recorded, 70% or more of the physicians are co-operating. May not this observation offer the explanation sought by venereal disease specialists as to what has become of their practice?

The wide differences among the cities in the proportion of physicians reporting must not be interpreted as indicating wide differences in venereal disease incidence for it has been shown in other studies that there is but slight variation in the incidence rate among the cities of the State. The variations may indicate the degree of confidence which the physicians have in the laboratory service at their command and the degree to which they feel the necessity of laboratory confirmation of their clinical diagnoses in cases of syphilis and gonorrhea.

The study, it must be said has convinced us that the practising physician is looking for and finding venereal diseases among his patients and that he is exercising care in his diagnoses using the laboratories extensively for confirmation of his clinical findings. It is also seen that the physicians reporting are fairly evenly distributed over the State. Among physicians with urban or rural practice the ratio reporting either disease is larger among those with urban practice, but the difference is decidedly less marked for gonorrhea than for syphilis.

The excess of "Physicians Finding or Suspecting V. D." over "Physicians Registered in Directory" can be accounted for by the changes which have undoubtedly taken place since the directory was issued.

## THE TREATMENT OF CERTAIN CARDIAC IRREGULARITIES WITH QUINIDINE\*

ROBERT L. LEVY, M.D.

NEW YORK CITY.

IT WAS to be expected that quinidine, a therapeutic agent capable of inducing such dramatic changes in the cardiac mechanism, would be hailed with enthusiasm by those concerned with the management of patients with heart disease. Clinical experience with the use of this drug has been rapidly accumulated and certain of its limitations and dangers have become apparent. It is a timely task briefly to take stock of some of the information which has been gathered, in order that we may begin to formulate a point of view with regard to the ultimate place of quinidine in the treatment of disorders of the heart beat.

The drug has been employed in the attempt to influence a variety of arrhythmias. Those meriting particular discussion at this time are (1) auricular fibrillation, (2) premature contractions, (3) paroxysmal tachycardia.

### AURICULAR FIBRILLATION

*Clinical Significance of the Irregularity.* Perpetually irregular pulse, resulting from fibrillation of the auricles, is a common form of cardiac irregularity. It constitutes, in fact, about forty per cent of the arrhythmias and is most frequently, though not necessarily, encountered in patients with stenosis of the mitral orifice. In some individuals with relatively little myocardial damage, the irregularity is well borne, they may, under proper management, live for years after the onset of fibrillation in relative comfort. More often, however, the very presence of the arrhythmia is a cause of unpleasant symptoms, chief among which is palpitation. There are signs and symptoms of circulatory embarrassment, the number and degree of which vary in a measure directly with the rate of the ventricles. The benefit derived from digitalis in auricular fibrillation depends in large part upon the efficacy of this drug in controlling ventricular rate and maintaining it at or about seventy. In order to hold the heart rate at this level, continuous digitalization is usually essential.

But even under optimum conditions, the output of the heart per minute is less when the auricles are fibrillating than when normal rhythm prevails. This fact has been demonstrated by experiments on animals as well as by observations on patients. Certain of the heart beats are ineffectual in propagating a pulse wave to the wrist. The difference between heart rate and pulse rate, the *pulse deficit*, furnishes a rough clinical meas-

ure of the degree of cardiac inefficiency. The heart is not under its usual nervous control, so that tachycardia is readily induced and is accompanied by an increase in the number of beats which fail to reach the peripheral circulation. Resumption of the normal rhythm abolishes the necessity for continuous digitalis medication, usually causes the disappearance of many unpleasant symptoms, and results in a more efficient circulation, particularly in response to effort.

*Selection of Suitable Cases.* It is desirable to emphasize at the outset that not every patient with auricular fibrillation is a suitable subject for receiving quinidine. Experience has shown that in only about fifty per cent of unselected cases is it possible to restore the normal rhythm. It is difficult to choose from those who present themselves for examination, the individuals in whom a brilliant therapeutic effect may be anticipated. A certain number may, however, be excluded as unsuitable for the treatment, because it is believed that not only will the issue be unsuccessful, but because in them certain untoward effects are likely to be induced.

Various criteria for the selection of patients have been advanced. A good myocardium is the prime requisite. This usually means that there is little or no cardiac hypertrophy and that the symptoms of failure, if present, yield promptly to treatment. Fibrillation of recent onset responds more readily to quinidine than that of longer duration, though one of my most satisfactory results was achieved in a man who had been known to be fibrillating for seven years. He had, however, a competent heart muscle. Etiology, likewise, furnishes but little aid in choice. Rheumatic and arteriosclerotic groups have fared about equally well. Cases of mitral stenosis have done better than those with aortic disease or combined valve lesions. In my experience, patients with no valvular disease and relatively small hearts have fared best. Cases of hyperthyroidism, in which the heart muscle has not been badly damaged, have also been greatly benefited, especially when there has been coincident improvement in thyrotoxic symptoms.

Conversely, patients with evidences of a badly damaged myocardium are unsuitable for quinidine treatment. Such individuals, even after proper measures instituted to relieve heart failure, regain but little cardiac reserve. They have, as a rule, hypertrophied hearts. In them, it is rare to restore normal rhythm, and if this should return, its duration is apt to be brief. In this

\* Read at the Annual Meeting of the Medical Society of the State of New York at New York, May 23, 1923.

group must be placed cases reported by some observers as "unimproved after resumption of sinus rhythm." It is in these individuals also that untoward effects are likely to occur.

**Technic of Treatment** The technic of administration is important. The patient should be in bed, under close observation, preferably in a hospital where alterations in mechanism may be followed under electrocardiographic control. Treatment at home under the supervision of a competent nurse, familiar with the actions of the drug is permissible. The treatment of ambulatory cases is to be deprecated.

It is advisable, before starting with quinidine to combat heart failure, if this be present. Digitalis should be given, if indicated. An interval of four or five days between the completion of digitalization and the beginning of quinidization has been found desirable, for both practical and theoretical reasons.

The scheme for a course of therapy which I have previously outlined, and which has been followed by a majority of workers, has been found satisfactory. The alkaloid is given in capsules, individual doses being administered at two hourly intervals. In this way, adequate concentration is maintained. On the *first day* are given two small doses of 0.2 gm each. These serve to test for drug idiosyncrasy. If symptoms of cinchonism are noted it is wise to desist at this point. Otherwise, on the *second day*, are given three doses of 0.4 gm each. *Third day* four doses of 0.4 gm each, *fourth day* five doses of 0.4 gm each. If further dosage seems desirable the plan followed on the fourth day is continued. No more than 2.0 gms are given in a twenty-four-hour period.

It is rarely necessary or advisable to continue treatment for longer than a week. For if normal rhythm is to be established the change will usually occur within this period, most often between the third and fifth days. Should it appear after more prolonged therapy, it is unlikely to be permanent. However if one course of treatment is unsuccessful, and without unpleasant symptoms, a second may be given after a short rest. Sometimes such a second course results in a satisfactory issue.

**Duration of Effect** The duration of effect after a single course of therapy is variable, ranging from a day to as long as a year and a half. In the cases of fibrillation of long standing there is usually a tendency to relapse often at fairly definite intervals. In one patient, known to have been fibrillating continuously for two years and in whom the duration of normal rhythm after a course of treatment was about three weeks, interrupted normal rhythm was maintained for sixteen months by the daily administration of 0.4 gm, supplemented every two weeks by three capsules of 0.4 gm each. Fibrillation recurred at

the end of this time because the man was unable to procure his usual supply of quinidine. He returned to the hospital, and in four days his heart was again beating regularly. He went back to his job as an ironworker. There was no evidence that such prolonged quinidization produced any deleterious effects.

**Paroxysmal Fibrillation** The cases of paroxysmal fibrillation are worthy of special mention, because in them the results of continuous medication have been gratifying according to a number of accounts. Hart reports a man, in whom the attacks recurred at intervals of a few days, who, on daily doses of 0.4 gm, went for a year without relapse. I have at present under observation a man who had been having attacks of fibrillation every two or three weeks for two years. He has now gone for four months without recurrence and with great relief, both physical and mental. Patients with paroxysmal fibrillation commonly possess a relatively competent myocardium. In these cases the dangers of untoward effects from quinidine especially embolism, are negligible.

**Clinical Toxicology** The various unpleasant symptoms which may follow the taking of quinidine, though causing temporary discomfort, are of no serious import. Concerning certain graver untoward effects, much has been written. Chief among them must be mentioned the induction of heart failure, respiratory paralysis, the appearance of rhythms indicating poisoning of the heart muscle, embolism and sudden death.

The ventricular rate rises after quinidine and the tachycardia may cause the patient to complain of palpitation. This usually subsides after the lapse of several hours. If the treatment is carried on over a number of days, particularly in an individual in whom the ventricular rate is rapid when not under the influence of digitalis, persistent tachycardia may ensue, with resultant signs and symptoms of cardiac failure. Careful clinical observation will avoid such an occurrence, for, if the tachycardia persists, with no alteration in rhythm, the condition may be promptly remedied by the adequate exhibition of digitalis.

Certain individuals appear to be unusually sensitive to quinidine, although personally I have not encountered such a patient. It is for this reason that the two small probatory doses are given before entering upon a full therapeutic regime. Several cases have been reported in which transitory respiratory paralysis followed ingestion of relatively small amounts. No idiosyncrasy to the drug was manifest after the test doses. Such accidents, fortunately rare, are difficult if not impossible to prognosticate and thereby avoid.

Premature beats of ventricular origin are frequently observed after quinidine. They are some-

tervals long enough to ensure a normal desire, yet digestive tonics and stimulants tend rather to overeating and thereby to derange a weakened digestion and induce further malhygiene.

Sauerkraut is a food now being lauded as a stimulant to the appetite. Probably sauerkraut is wholesome and nutritious and may have other advantages, but that is not the point. A healthy appetite needs no stimulation and the rational treatment of an unhealthy one, whether lost or excessive, is temporary starvation, and it is probably safe to say that the catsup-maker knows it.

Overeating is very generally encouraged by such advertisements as those of cake and cracker, ice cream and candy manufacturers whose beautifully colored plates and posters picture delighted children indulging in their wares. Here the manufacturers have cleverly taken advantage of the reflex originating in the sight of food. Many a weakened digestion has had its origin in food that looked too good to resist. Foods are taken by the satiated often simply because of their color, their shape or their decoration, and when well pictured the same effect is produced. Color and form are associated with pleasing tastes. The methods of the food advertiser are comparable to those of the highly paid chef whose financial security depends upon his ability to prepare what will be eaten by those who are not hungry.

Ice cream makers have made much of milk propaganda, one going so far as to publish the statement that "the child who is ice cream crazy is in no danger" and that "the laborer's child may get the ice cream habit and keep it that all it will do is just what milk will do: nourish their bodies, feed their blood, harden their bones." How can we expect the public to ignore this advice when, inadvertently I hope, it is encouraged to force a definite amount of milk down the throats of its children without regard to their needs or digestive capabilities and, in many cases, against their own instinctive repulsion.

Excesses in the direction of individual food elements must oftentimes result from such dicta as that "a diet of shredded wheat avoids many ailments that are common to youngsters" or that to live long and to keep young "half of your food should be bread." The shredded wheat boy is described as "full of jazz and ginger, off to school with bounding buoyancy and vigor, tackling study and play with dash and daring, star performer in all athletics," "the boy who eats shredded wheat for breakfast, for lunch, for dinner and in between meals." It reads like a circus bill and is about as truthful. The present prevalence of starch intolerance in children very probably depends to a large extent upon such education. Think of the effect upon development of teeth and digestive tract generally of

such pap feeding, requiring practically no mastication or digestive effort.

Underfeeding, too, may result from obviously dishonest comparisons of caloric values as instanced by a full-page colored plate representing a box of popular cereal balanced upon a scale against its supposed equivalent of three tomatoes, eight eggs, two apples, several potatoes, a large beefsteak and other things not so easily recognized.

Again, probably as much, if not more of what might be called the less acute type of domestic unhappiness is caused by the chronic indigestion and toxæmia of sweet eating as by alcohol. A pampered candy-fed child may disturb the family felicity as effectually as an intemperate father, and when we realize the extent of the candy habit we appreciate its significance, and yet mothers who ride in street cars read that *Repetti's Caramels* sweeten the disposition. If they do, it is certainly only temporarily. So will alcohol.

The question of the raisin packer "Have you had your iron today?" has probably driven many a child into the nutrition clinic. The fear of anæmia is very real, but the lack of iron secondary to malassimilation can never be supplied by raisins, particularly when given as sweetmeats at all hours of the day. Digestive derangement and aggravation of the symptom must result unless there is a realization of the fact that however great the supply it can only be absorbed by healthy organs. There is abundance of iron in more easily digested food as meats and vegetables.

Constipation has always been a magnificent field for the charlatan. The gullible public is led to pin its faith to canned, dried and preserved fruits to the point of overfeeding with these preparations, which if taken in excess and sweetened, as they must be to preserve them, and at irregular intervals, must increase rather than relieve the condition. One advertisement of dried peaches and figs shows a child with a large piece of pie in each hand.

It is not to the foods themselves, if sensibly consumed, that I object, but to the selfish effort to increase their consumption at whatever cost, to the misleading statements which are tending to institute bad dietetic habits, dangerous particularly to the young, habits which we as their guardians are striving to eliminate in the interest of physical development.

Such propaganda cannot be combated by legislation. Where creature comforts are concerned legislation has always failed. It must be done by education. Our standards of medical ethics must be broadened to allow of a fight, with similar weapons, for a better cause.

## ANNOUNCEMENT

With this issue the JOURNAL assumes a new dress for the sake of ease of reading. The bold titles of the Departments and the double-column headlines of the articles will draw attention to the reading matter.

The great reservoir of law cases will be tapped and the Legal Department will be expanded to include a description of lawsuits affecting every type of practitioner.

The Legislative Department will be largely seasonal, and will be the dominant feature of the JOURNAL during the session of the legislature. The immediate question before the State Medical Society is that of re-registration, or re-certification, but this is only a step toward the goal of an adequate Medical Practice Act. The JOURNAL will record and reflect the strenuous activity of the Legislative Committee particularly along these two lines. Extra numbers that take the place of former Legislative Bulletins will be issued during the legislative session for the information of all the members as well as of those serving on legislative committees.

Correspondence is solicited— voluminous or suggestive formal or fragmentary, commendatory or critical—anything so long as it contains

ideas. Send us your raw thoughts, and we will fit them into a complete structure representing the medical sentiment of the entire state. The correspondence that is not printed will have a very great suggestive or inspirational value to officers of the Society.

News must be a leading feature of a journal covering the activities which are common to all physicians. The kind of news that is especially desired is civic rather than personal and a record of Medical Societies rather than of individuals. The doings of every County Society, small or large will be set forth in readable style provided the facts are sent to the JOURNAL in time for publication. Send us your news items and we will clothe them, and co-ordinate them with similar items from other parts of the state. The Editors of the JOURNAL expect to discover and draft that encyclopedic member that exists in every society.

The officers of the Medical Society of the State of New York will use the JOURNAL to give full publicity to their activities, they ask every member to read the JOURNAL, and to co-operate in the activities of the Society.

## A FOREWORD FOR 1924

A physician has three great relationships

- 1 With his private patients
- 2 With other physicians
- 3 With the public

The very first duty of every physician is to his patient, and the laws protect both the doctor and the patient in this relationship. This has been almost the only relationship that has been recognized up to recent years. But now it is recognized that the best interest of the patient requires that the physician have definite contact with other physicians, and perform certain public duties which may conflict with the immediate comfort and convenience of his patient, as, for example, in cases of communicable diseases. There is great need of promoting this sense of relationship of the physician to his fellow and to the public.

Most physicians prize the good will, the co-operation, and the companionship of their fellow practitioners. The ties among physicians are probably stronger than those among the members of any other profession.

The sense of a broad relationship of the physician to the public is a new development which is fostered by a few leading spirits whose social and civic instincts are well developed, and who are imbued with a true missionary spirit. While only a few doctors are fitted by nature and training to be leaders in medical civics, yet every physician realizes his peculiar duty to contribute some portion of his trained ability to the general public good.

A physician keeps abreast of the times in three ways

- 1 By his own experience
- 2 By word of mouth through contact with his fellow practitioners
- 3 By reading medical publications

The physician who thinks only of his relation to his private cases ceases to progress, and is in grave danger of forgetting what he learned in the medical school. He goes backward in spite of the experiences which he gains. The independent doctor who has nothing to do with his associates is fast becoming a rarity—fortunately for both the profession and the public.

The great stimulus to a physician's progress is his contact with his brother practitioners in three principal ways

- 1 In consultations
- 2 In teaching clinics
- 3 In organized societies

Gone is the old-fashioned consultation with its formality, its mystic secrecy, and its oracular

pronouncement. It had its origin in the days when experience was almost the only source of information, and a physician guarded his own peculiar knowledge as his private capital which was not to be divulged to other doctors. Hence arose the popular idea that "Two heads are better than one", that certain physicians were endowed with a mysterious second sight, and that their pronouncement of life or death was final.

Physicians today habitually seek informal consultations with their brethren and talk over their difficult cases to an extent that is not appreciated by the public. When a patient is desperately sick, the chances are that his physician has talked about his case with several of his colleagues, and that the patient is getting the benefit of the collective knowledge of the best medical talent in town. The consultation benefits both the patient and the physician.

Teaching clinics are being brought more and more within the reach of general practitioners, and their extension will be one of the great medical movements of the future. A sense of altruistic duty is impelling leading specialists to donate their time to bringing clinics to physicians in rural communities, and physicians are awakening to the benefits of their opportunities for acquiring knowledge. Medical schools, county societies, and state departments of health are all co-operating to enable every physician to keep himself informed of medical progress.

The recognition of the educational value of the intimate contact of physicians with one another has led to a great growth in medical societies in recent years. This growth is the expression of the natural desire of individual physicians to take an active part in medical progress, both in giving and receiving. Medical societies are organized along five principal lines

1 Special—surgical societies and the dermatological

2 Local groups of a city or county

3 State societies

4 National societies

5 International societies

6 Special societies for the study of certain diseases

7 Special societies for the study of certain organs

8 Special societies for the study of certain methods of treatment

9 Special societies for the study of certain subjects of medical science

to give and receive instruction. It is almost the invariable rule that every physician or research worker who has a new piece of work to report shall deliver it first before a medical society and shall subject it to the criticism of his fellow workers. Medical societies are the greatest sources of information on all medical topics.

A physician usually learns of medical progress in two principal ways:

- 1 By attending society meetings
- 2 By reading reports of the meetings in medical journals

Even though a physician attend a society meeting, he desires a printed report of the proceedings for permanent record and for study. He looks for those reports in the medical journals. Most medical journals are the organs of medical societies and their contents reflect the activities of the societies.

The articles in medical journals may be divided into two great classes:

- 1 Those on technical medicine
- 2 Those on medical civics

Some prominent medical men would confine medical articles to reports of entirely original scientific work. These reports properly belong to the scientific journals of the specialties—eye, gynecology, skin & venereal diseases, and other special branches. But the great mass of general practitioners call for simple articles of a text-book nature, which describe the elementary principles of a disease and its treatment. For example, there has been a flood of articles on insulin therapy, but nearly all assume that the reader knows his physiological chemistry, and can think in exact terms of calories and the utilization of proteins, fats, and carbohydrates. General practitioners have never had to use these details, and are unfamiliar with the exact modern conceptions of the assimilation of the various classes of food stuffs. They will welcome an insulin article which will give a short page to a review of the basic physiological principles on which the use of insulin is founded. What each society needs is a journal suited to the medical attainments of its average member. This means that THE NEW YORK STATE JOURNAL OF MEDICINE shall seek articles suited to average family doctors who constitute over 75 per cent of its membership. There is just one limitation to the realization of that ideal, and that is that the JOURNAL is bound to publish the papers which are read at the annual meetings.

It will be the endeavor of the editors during the coming year to see that each issue contains at least one article which will be of great practical value to the general practitioner of medicine. The JOURNAL will also welcome articles

which record the original work of specialists, particularly when it has an appeal to the family physician.

Scientific articles have a special appeal to the doctor in his private relation to his patient. While this appeal is fundamental and necessary, yet the relations of the doctor to his colleagues and to civic movements is increasingly important. The editors plan to feature the following departments during 1924:

- 1 Scientific articles
- 2 Editorials
- 3 Legislation, especially during the session of the Legislature
- 4 Legal, especially a discussion of lawsuits which are brought against physicians
- 5 Public health, especially a record of the several departments of health
- 6 A forum for correspondence, especially that containing constructive criticisms
- 7 News

Few persons have a conception of the immense amount of routine work that is done by the officers of the Medical Society of the State of New York. The officers collect, classify, and interpret information, and direct the manifold activities of the Society. They represent the Society at hearings and investigations and voice the sentiments of the ten thousand practitioners who belong to the Society. The greater part of their work is along the line of Medical Civics and concerns the relation of physicians to one another and to the public. The JOURNAL will keep the members informed regarding the activities of the officers of the State Society during the coming year.

It is planned that the news items shall cover the activities of the various societies through the State, and shall be in reportorial form after the manner of the best reporting in daily newspapers. An attempt will be made to put the reports in the form of intimate friendly talks, and in the language that a physician would use in describing the event to a medical friend with whom he is conversing. It is planned to cover the various sections of the State by means of correspondents who will send the news of events occurring in their sections of the State.

THE STATE JOURNAL OF MEDICINE will contain a prophecy of the future as well as a history of the past. The special work of the leaders in the State Medical Society is to discern the signs of the times, and to lead the members in all matters relating to medical progress. The JOURNAL will broaden its policies and extend the scope of its activities until the progress in medical civics is commensurate with the great evolution that is taking place in scientific medicine. F O

## ACTIVITIES OF 1924

The Committee on Publication, in an effort to develop intimate co-ordination of all elements of the State Society, intends to issue a State Journal Weekly on the Fridays of February, March, and April while the Legislature is in session.

In order to do this work effectively, the Council has engaged the services of the capable and experienced editor of the *Long Island Medical Journal*, Dr. Frank Overton, to serve the Society as Executive Editor, to carry the JOURNAL through this experiment.

Dr. Overton will give all of his time to the JOURNAL during this period, and we trust that all

of our members will give him hearty and enthusiastic support.

We are entirely sanguine of his success.

The Governor, in his message to the Legislature, indicates a favorable attitude toward the enforcement of the Medical Practice Act, and would probably sign an enforcement bill, providing the measure passes.

With complete accord between the Governor and the State Departments of Health and Education, the situation is squarely up to every physician to use every influence he possesses to enlist his individual legislative representative upon the side of honest medical practice. N B V E

## RE-CERTIFICATION AND THE MEDICAL PRACTICE ACT

At the request of Governor Smith a short time ago, the President of your Society was asked to assemble a small committee for conference relative to pending legislation before the Houses at Albany. The committee was somewhat in the dark as to the exact motive for this meeting, and therefore were not fully prepared to meet in a constructive way the fullest suggestions of the Governor.

We were pleased to know that Governor Smith was anxious to co-operate with the medical profession for a more careful safeguarding of the health and welfare of the State. Three or four pertinent questions came up for discussion which should be the property of every member of the State Society.

There seemed to the President a number of valid reasons why re-registration, or more properly re-certification, was unnecessary. We felt that men who had been in practice for many years had no occasion to register where they were already so well known. We were surprised to learn from Dr. Downing of the Department of Education that there had been no survey or study of men who were entitled to practice medicine for forty-three years. More than this, we were amazed to find out that diplomas of dead men are being used, had been sold by the widows of Doctors, and had been assumed and paid for by men who never took even the examination. We were likewise surprised to find that the old law relative to registration in the County in which the man practiced was never placed upon any alphabetical list, but that these registrations were filed according to date. Therefore in the State of New York if one cared to inquire as to whether a man had registered or not, he had to go to every County and look through the complete file of dates, as there was no way of reaching the name alphabetically.

This condition of affairs was rather appalling and the request that the survey and re-registra-

tion be made seemed not only necessary but absolutely imperative.

The President of the State Society likewise objected to having each member pay a fee of \$2.00, as we felt that in paying this fee we were merely paying what the State should contribute for doing the State's business, namely, the protection of the health of the community. Upon going into this subject, we found that nurses, dentists, engineers, etc., etc., all paid a fee, and that the sum total of this amount was about \$350,000 a year income to the State. We contended that it was poor government when individuals paid separate fees, and in this the Governor agreed with us, stating that it was unfortunate that the State was working under such a system, but that it had been so for a long while.

We found that in 1916 the dentists had taken the same attitude that we are taking in opposing yearly certification. We were rather surprised to learn that after several years they not only considered it no hardship, but insisted that this system be continued because it had so thoroughly and effectively ridded various communities of illegal dentists. More than this we were assured by Dr. Downing, Assistant Commissioner of Education, that he had the machinery for preventing any illegal practitioner claiming to be a dentist from re-entry into any community.

We then brought up the question as to whether a physician who might fail to re-certify or re-register within the prescribed time, would suffer a loss of his license to practice. Governor Smith assured us this would not take place. A penalty for the failure to re-register might be inserted into the law, but no man could be disfranchised from the practice of medicine who was legally entitled to do so. If by any oversight he failed to register, the payment of the re-registration fee and a minor penalty fee would promptly restore him to his former status.

We went to Albany somewhat impressed with the idea that the law as suggested might be onerous and undesirable. We left with a feeling that the physicians of the State of New York had nothing to lose, and everything to gain, and that is if we did not fall in line with other professions we would merely be a conspicuous example of opposition—opposing merely for the

sake of being different. This position is untenable.

We believe that when the physicians throughout the State thoroughly understand the purport and the desire of the Governor and the Governor's committee they will be more than impressed with its fairness, its justice, and the wisdom of its accomplishment. O S W

## THE ILLEGALITY OF CULT PRACTICE

Physicians need to have a clear conception of what is illegal and reprehensible in the practice of the healing cults, and to be able to present their arguments in a form which is clear and non-technical, and which can be understood by the average layman and legislator.

It is not illegal or reprehensible for anyone to visit the sick, to speak words of encouragement to them, to pray with them, or to administer food, baths, or massage to them in accordance with the present every day standards of such acts. It is not illegal and may not be reprehensible for anyone to make it a practice to offer his services in these lines, or even to accept pay for services rendered, provided the services are not at variance with similar services in vogue in the community. A nurse or a masseur for example may practice such a calling for pay, and a social worker may speak motherly words of encouragement which might not be justified by a strict scientific analysis of their import, because each of the above has presumably been schooled in some type of education along the lines of modern scientific thought. But these basic principles of certain acts being not illegal nor reprehensible are incomplete and misleading as is the oft-quoted statement—that 'all men are created free and equal'.

When do encouraging words or prayers or physical manipulations cease to be desirable and become reprehensible and dangerous?

The answer is—when they either cause direct harm, or invite a patient to neglect a standard plan of treatment evolved in accordance with the present day sciences and which would bring relief or cure. Examples of direct harm done by cultists is the "water cure" pushed to its limit in the case of a patient already so edematous from a nephritis as almost to burst from added edema, or the manipulation of spines and limbs during the first few weeks in a case of poliomyelitis or the manipulation of bones or joints in cases of fracture. Examples of harm and death resulting from neglect of standard scientific methods of treatment are the ignorant manipulations in cases of aneurism of the aorta with rupture following, where X-ray and like means of diagnosis have been neglected, or so-called treatment of diphtheria without culture or anti toxin.

It is not illegal, but it may be said to be repre-

hensible for a patient to diagnose his own case, and then to seek relief from whatever source he may wish to obtain it.

If a physician says that he has done all that he can for a patient, no one can blame that patient for trying another physician, but in the large percentage of cases the patient only fools himself when he tries a cultist whose theory fails to recognize such sciences as physiology, chemistry and the unfolding of the human anatomy and its organs by the present wonders of the X-ray, serology, and like methods of diagnosis.

A "chronic backache" is a condition for the treatment of which certain cultists gain great fame, because without an accurate diagnosis as to its origin remissions in the pain may be frequent and are sure to follow every, as well as no, line of treatment. Should an accurate diagnosis have been made, the pain may be found to be due to a beginning tuberculosis of the vertebra, which would require absolute rest for the part.

Patients sound the praises of the cultist and the cultist waits the praise of the patient further through the blowing of his own horn and says—"I cured Mr. Achebak of a terrible kidney pain and I can cure your pain, which is only half as bad as was his." No account is taken of the indifference of some patients to the quantity of pain endured nor even to the quality, or point of expression of the pain. It is at this point that reprehensibility and illegality enter.

What may be the proper treatment for the pain of "lumbago" is deadly for the aches of a tuberculous kidney left long undiagnosed, for in the cultist's treatment one sole method is sufficient for all. The cultist may treat a plain "lumbago" with impunity, for the cause thereof will undoubtedly become better whether the patient receives treatment or not, if the trouble be only located in the muscles and ligaments which are non-vital parts and which are probably involved through indiscretion in diet, but he cannot diagnose, analyze reason to or treat conditions of the vital organs such as the kidneys, through simple laying on of hands—determine the cause and neglect such vital points as a temperature—a rise in pulse rate—a pathological urine and the like—because he knows little of the structure and action of the kidneys and less about the common diseases to which they are subject, having dis-

carded as useless those facts which have been built up from day to day by scientists of every branch, and in fact declare them to be false from every angle

Yet the cultist promises cures for all sorts of symptoms, for his treatment rests on symptoms alone and not upon the causation of disease

Cultists of all kinds put forth with a stream of words the monotonous argument that anyone has an inalienable freedom of choice of a healer or a system of healing. The truth is, that few persons would seek the cultist if the cultists themselves did not actively seek patients and, through their advertisements, hold out rosy promises of cure for every person who would come under their treatment. The patients of cultists are irresistibly drawn to them by dazzling promises of cure. They throw judgment to the winds and place a blind faith in the cultist because of the promises of sure cures—such promises as no reputable physician would dare to make after a careful and scientific physical examination. Would that the patients of the cultists publish their results of failure as freely as do the few who have apparently received benefit after the remission of their disease!

The cultist in many States already has the right to minister to the sick with encouraging words, prayers, or manipulations, but refuses to assume responsibilities of education as measured by the preliminary standards of those States—standards required in all professions. Still he makes strenuous efforts to obtain a statutory right to practice, including the mandatory paragraph in his law to use the title of doctor.

Why does he make such efforts? The answer is, to attach unto himself a title which has come down through the ages as representing a certain period of required education in connection with all of the sciences that have unfolded during the world's progress, and to gain such title in the easiest manner possible so that he may bring be-

fore the people the fact that the State has licensed him legally to make promises of cures without the necessary investigation as to the worth of his type of treatment.

A statutory license is legal recognition that the State considers the practitioner of that type of treatment as educated to a sufficient degree to apply his treatment to every kind of disease. The cultist claims his treatment is good for anything with which a patient may be afflicted. He therefore boldly proclaims that diagnostic skill is unnecessary.

The licensed cultist is immune from prosecution so long as he applies his treatment faithfully, and has had the seal of approval placed upon his form of treatment by the State, and is therefore only to be prosecuted in the civil courts for his failures by the individual patient who would proclaim before a jury of the failure in relief.

That cultist who disregards diagnosis or whatsoever it may be called, in determining the pathological lesion present in a patient, and who claims that his system of treatment or application is a sole and only cure for all human ills, is either densely ignorant or criminally dishonest. In either case the public suffers through its indifference to demand of the State that its rights be protected.

Physicians of the present day are unalterably opposed to giving the legal right of treatment to anyone who is either ignorant or dishonest, and they have consistently fought against the public being made a prey of cultists who refuse to incorporate in their theories of practice the common knowledge of the present day as developed through the correlated sciences. Physicians do not hesitate to rise to the defense of the public health when new cults spring up which do not incorporate in their tenets the study of the sciences as accepted in this day and generation.

# LEGISLATION

## THE PROPOSED MEDICAL PRACTICE ACT

By AUGUSTUS S. DOWNING, LL.D.

Assistant Commissioner of Education and Director of Professional Education, University of the State of New York

The Medical Practice Act is not yet in form, but we hope to have it ready for submission to those who are most deeply concerned at a date not later than the 10th of January, and to have it ready for introduction not later than the 15th of January.

I will state the several proposed amendments numbering them seriatim with such comment as may seem necessary to the full understanding of each when comment is necessary.

1 The annual registration of physicians with the Secretary of the State Board of Medical Examiners and the payment of the annual fee of not to exceed \$2.00. Such annual registration to eliminate the necessity of physicians registering with the County Clerk.

*Comment.* Such annual registration will enable him therefore to practice in any County of the State instead of following the procedure now necessary under the law, namely the registration in the office of the County Clerk in the County where he originally became a practitioner and the registration of a transcript of such original registration in the office of the County Clerk of any other County in which he may desire to practice.

Failure to register annually would not work the forfeiture of the right to practice provided such failure to register annually was not due to willful refusal to register. If any physician should be negligent in returning the first card sent him in an annual registration, a second card would be forwarded to him in due time—even a third card would be sent him before action would be taken looking forward to the revocation of his license, and if, perchance, he were ill or out of the State, such illness or absence would be deemed sufficient reason for excuse of his default, and if he should remove from the State to some other State, it would not be necessary for him to keep up his annual registration while residing in such other State but upon his return to this State he would again become eligible to practice after filing his annual registration card and the payment of the fee for that year. It might be of interest to you to know that while the annual registration of dentists has been enforced since 1916 we have not had occasion to revoke any dentist's license because of failure or delay in registering even though some of the dentists have at times been negligent.

2 The prohibition of the use of the word Doctor or any abbreviation thereof in connection

with the same of any practitioner who has to do with the public health in any of its phases whatever unless he be a licensed physician, a licensed osteopath, a licensed dentist, a licensed veterinary surgeon, or other licensed practitioner authorized by statute to use the word Doctor or abbreviation thereof.

*Comment.* The use of the word Doctor or the abbreviation thereof before or after the name of all kinds of nondescript individuals who are posing as able to treat human ills by some occult or pretentious method is both detrimental to the public health and conducive to fraud and deceit and to robbing the public of their money for services wholly valueless, not only wholly valueless, but in many instances actually detrimental to the individual as well as to the health of the public.

3 The provisions for the revocation of the license of any physician because of fraudulent or deceptive advertising.

*Comment.* The revocation of any license could only be accomplished after the charges had been formally preferred and the physician had been served with a copy of the charges and had been given the opportunity of being heard either in person or by counsel or both, and the Board of Regents to hear and determine the case. This insures the physician a fair trial before a tribunal of laymen. Such procedure for revocation of a medical license is already provided in the present Medical Practice Act. This amendment therefore only states one more cause for which a license may be revoked.

4 The prosecution of all illegal practitioners by the Attorney General in civil cases, and the initiation by the Attorney General of all prosecutions in criminal cases by his placing all the facts in the case before the District Attorney of the County in which the violation occurs, and if the District Attorney wishes the Attorney General to prosecute, then the State's attorney will prosecute such criminal cases.

*Comment.* This amendment will provide for the appointment of a Deputy Attorney General whose entire time shall be given to the prosecutions of the violation of the Medical Practice Act or of any other of the professional laws if he has the time for such, his salary to be paid out of the fees, fines, and penalties accruing from the administration of this law, and the moneys collected as a result of the annual registration to be available for the protection of the public and the profession.

## LEGISLATIVE NOTES

By JAMES N VANDER VEER, M.D.

The medical education of a student in the State of New York now rests with the Board of Regents for the required preliminary medical certificate, which requires that the applicant for permission to study medicine shall have completed two years of certain college work, known as the pre-medical course, as required by the rules of the Board of Regents as adopted under Chapter 328, Sec 166, sub-division 3, Laws of 1916—said rules being amended from time to time by the Board of Regents in conformity with the increasing educational standards of the State

Following the granting of such a certificate by the Board of Regents, a student presents it to the medical college in which he desires to take his course, and is then subjected to whatever entrance examinations the college may require

Having pursued his course through the medical college in a proper manner, and having been graduated from a medical college, the student who desires to practice in the State of New York must present his diploma to the Board of Regents (State Department of Education), and receives therefrom permission to take the medical examinations given by the State Board of Medical Examiners whose members are appointed in rotation by the Board of Regents

The candidate then takes the examinations as prescribed by the State Board of Medical Examiners, and if successful, is given a certificate under seal of the Board of Regents, and with his photograph pasted and certified thereon, which is the authority for his registration in any County Clerk's office of the State of New York, and thus he pursues the legal requirements of the present to practice medicine

It is necessary for him, before actually beginning the practice of medicine, to register his certificate from the Board of Regents in the County Clerk's office in the County in which he proposes to reside, or to claim as his residence for practice, and the said certificate is copied into a certain book provided for that purpose

Under Chapter 357, Sec 51 Laws of 1917, the Regents were given power to accept evidence of preliminary and professional education for licensing a candidate to practice "in lieu of that prescribed by the laws relating to such a profession, or they have further power to indorse a license of a practitioner in medicine who presents satisfactory evidence that his license to practice in the State from which he wishes to reciprocate, had the equivalent of the requirements in force in said State when such license was issued, as was in force in this State at that time, and so forth"

It will therefore be seen that the theoretical part of the law is well cared for, so far as the

preliminary education and medical education is required

The crux of the situation has been in the enforcement of the law, and in this the Medical Society of the State of New York has ever been interested, and has tried in successive years to incorporate in one or another of the laws of the State, means of enforcement of the law. In this, they have continually failed through political or personal animosity on the part of individual groups depending in large measure upon the conditions which the bills would remedy

The Department of Education makes claim that it has not the power nor the funds to investigate and prosecute illegal practitioners of any sort or kind—in some years harking back to the laws of 1877 and still further back,—which places the burden of obtaining proof, of expense, and of prosecution of illegal practitioners upon the individual County Medical Society, which must undertake and carry through this type of public health protection through its local District Attorney

Here has been the fault which should be remedied, because the State,—as the Medical Society of the State of New York looks upon it,—has outgrown the local educational supervision of professions as originally undertaken in the early part of the last century

In those days the law simply required that one who had a common school education could enter upon the study of medicine. Having completed his course, he was examined by a Committee of the Faculty of the Medical College, and granted his diploma, and at first, needed only to register in a County Clerk's office to legalize his practice

Later he was required to appear for examination before the Board of Censors of the local County Medical Society, and still later, as in Chapter 661, Sec 153, Laws of 1893, certain penalties were provided for falsely representing one to be a graduate practitioner of medicine, and penalties could be collected by the local County Medical Society, and then registration began with the Board of Regents

At this time, and since then, prosecutions were instituted by the County Medical Societies against illegal practitioners, as evidenced by the court records, but unfortunately, juries were not prone to convict, inasmuch as it was looked upon in most instances as local prejudice and jealousy, and so the County Societies began to demand that the State Medical Society undertake some means of prosecution whereby the stigma of local jealousy might be removed

From this has originated the theory that, inasmuch as the State safeguards the preliminary education and the medical course, as well as other professional courses, and can negate the

issuance of a license to a student, the State should be compelled to exercise its police powers through some recognized State official or Department, and to ferret out, investigate and prosecute illegal practitioners.

Court decisions are extant relative to what constitutes the practice of medicine, in sufficiency as to need no change as to the definition of the practice of medicine. The trouble lies, at the present, in having a County Medical Society appropriate from its meagre funds, amounts sufficient to instigate, investigate, and prosecute, which sometimes runs into thousands of dollars, and which the physicians can ill afford to spend, and so through inactivity they refuse to initiate or assert the legal right through the County Medical Society.

This being the case, and in view of the theory as propounded relative to the present State method of education, it would seem but feasible to legislate into the hands of the State Department of Education, the Attorney General of the State, or the State Medical Society a mandatory act, and to provide therein the necessary funds for cleansing the State of every illegal professional man, to say nothing of the medical aspect of the question.

*But the trouble has been to impress upon legislators that which is vital to the interest of the public health of the State.*

They come to the legislative halls, in many instances, bearing the local prejudice and jealousy which has pervaded their own local community and so vote against bills which would place the public health of the State under greater protection than is at present constituted.

Physicians are not averse to any type of practice which has been evolved along logical lines of the present day sciences as they are co-related and all that they demand is that a practitioner have sufficient preliminary education to be able to reason to a diagnosis, after suitable instruction in the light of the present day sciences, and of higher medical education, if one so wishes to put it. This is all the doctors have desired, but now what they are fighting for is an inspection, and examination if necessary, of many so-called practitioners of medicine, of individuals or of groups who essay to treat and cure body ills by various types of practice some wholly recognized in medical lines, some types only partially so recognized, while in some instances the type of practice has been found to have absolutely no scientific or logical basis.

It has been a hard fight to impress upon the legislators who are elected by the people, that public health is one of the greatest assets to a State. In some instances, one single question alone determines the election of a Senator or Assemblyman, and his campaign is made and election won on the platform of that single question,

without reference to any others which may be brought up and which may be of greater importance to the public good. Witness the last session of the legislature, in which the introducer of a bill when rising to move the passage of his bill, was greeted with an outburst of hoots and cat-calls because political influence had been so injected into the legislative body as to apparently render nauseous the question before the house. Needless to say, the bill was defeated though in itself, it would have increased the welfare of the people of the State by stricter attention to their public health.

There can be no question that the State desires to protect its people by means of its police powers from all sorts of crime—as is evidenced by our laws. Most assuredly some means should be taken by the State to protect the health of its inhabitants still further than exists at present, and through its police powers of investigation and prosecution, to control or eradicate the quacks and charlatans, the faddists and members of various cults who have had no preliminary training or education of a logical type to qualify them for diagnosis, strict analysis, or treatment of disease.

The State has shown its desire by the amendments of recent years to its professional laws—other than in the practice of medicine, however,—but its failure as a governmental entity has been expressed time and time again through its lack of support when the medical profession has desired to have the laws relative to itself made more stringent, and the means for investigation and enforcement provided therefor.

One suggested solution has been the appropriation of money to the State Education Department whereby it could employ investigators and lay the evidence before the local District Attorneys, but this has been frowned upon by the State itself on the plea of too great expense.

A second solution has been suggested that a registration of physicians be made, the expense of which shall be borne by the physicians themselves. This seems to be illogical, and is opposed by many physicians since the vast majority have been granted the right to practice medicine in the State through examination and payment of fee for that right, and the legal claim is made that such right is self-perpetuating during the life of the holder of such certificate and that it is the duty of the State to ferret out the illegal practitioner with the funds of the State which were paid originally to the State by the registered doctors.

In this connection attention might be called to the fact that the funds derived from the examinations of the professions far exceed the estimated cost of policing the professions and such as are in excess of the cost of holding the examinations are returned to the State Treasury.

peared an article which specifically summons them to fight against a registration bill when proposed in any State

They fear to come in contact with the law when the State is the prosecutor, because prejudice of local conditions cannot be pleaded before a jury, and the cases always end before the higher courts which interpret the laws most strictly

Cultists chuckle over the present law in the State of New York, for at present it penalizes the doctor of medicine only, and leaves them as cultists, severely alone save as a patient desires

to sue, when the latter is confronted before a jury with the answer to the complaint "that the cultist is not practicing medicine but is only practicing (whatever the cult may be)" and the *carefully selected jury* usually disagrees—with the result that the cultist is freed

There is no denying that we all desire some changes for the better, but how to accomplish it is the question under consideration

It is for the practitioners of the art of Esculapius and of Galen to now speak forth, following the ancient oath once more of the master Hippocrates  
J N V V

## PROPOSED BILLS

The following bills have been drawn by the Counsel of the Society, Mr George W White-side, and have been approved by the Council of the Medical Society of the State of New York, for introduction during the coming session of the legislature

Comments on the same are invited from the individual members of the Society, to be forwarded to the members of the Committee on Legislation

Dr James N Vander Veer, The Commons, Pine and Chapel Streets, Albany, N Y

Dr Frank D Jennings, 1083 Bushwick Avenue, Brooklyn, N Y

Dr George R Critchlow, 647 Lafayette Avenue, Buffalo, N Y

## MEMORANDUM

Certain chiropractors and other unlicensed practitioners, as well as manufacturers of certain nostrums, have from time to time, in certain advertisements, employed the names of physicians without their consent, for the purpose of advertising

Excerpts from articles written or remarks made by such physicians, usually of some prominence, without reference to the context are employed in this way without the consent of such physician and it is made thereby to appear that the particular person so advertising has the approval of such physician about the matter which is the subject of advertisement

In this way a fraud is worked against the physician, his professional standing is lowered and the public deceived

## AN ACT

To amend Section 421 of the Penal Law

The people of the State of New York, represented in Senate and Assembly, do enact as follows

Section 1 Section four hundred and twenty-

one of chapter eighty-eight of the Laws of 1909, entitled "An act providing for the punishment of crime, constituting chapter forty of the Consolidated Laws and known as the Penal Law," is hereby amended to read as follows

421 Untrue and misleading advertisements  
If any person, firm, corporation or association, or agent or employee thereof, with intent to sell or in any wise dispose of merchandise, real estate, service, or anything offered by such person, firm, corporation, or association, or agent or employee thereof, directly or indirectly, to the public for sale or distribution, or with intent to increase the consumption thereof, or to induce the public in any manner to enter into any obligation relating thereto, or to acquire title thereto, or an interest therein, knowingly makes, publishes disseminates, circulates, or places before the public, or causes, directly or indirectly, to be made, published, disseminated, circulated or placed before the public, in this state, in a newspaper, magazine, or other publication, or in the form of a book, notice, circular, pamphlet, letter, handbill, poster, bill, sign, placard, card, label, or tag, or in any other way, an advertisement, announcement or statement of any sort regarding merchandise, service or anything so offered to the public which contains any assertion, representation or statement of fact that is untrue, deceptive or misleading, or that amounts to an offer to sell, barter or exchange real estate, by means of prizes, rewards, distinctions, or puzzle methods, or *which contains or employs the name of any physician without his consent*, such person, corporation or association or the members of such firm, or the agent of such person, corporation, association or firm, shall be guilty of a misdemeanor, punishable by a fine of not less than twenty-five dollars, nor more than one hundred dollars, or by imprisonment for not more than one year, or by both such fine and imprisonment

2 This act shall take effect immediately

### AN ACT

To amend section 216 of Chapter 928 of the Laws of 1920 of the Surrogate's Court Act

The people of the State of New York, represented in Senate and Assembly, do enact as follows

Section 1 Section two hundred and sixteen of chapter nine hundred and twenty-eight of the Laws of 1920 is amended, entitled, 'An act in relation to surrogates and the practice and procedure in surrogate courts' is hereby amended to read as follows

216 Proceeding to compel payment of funeral or physicians expenses Every executor or administrator shall pay, out of the first moneys received, the reasonable funeral expenses of decedent and the reasonable charges of the physician or physicians attending the deceased in his last illness, and the same shall be preferred to all debts and claims against the deceased. If the same be not paid within sixty days after the grant of letters testamentary or of administration, the person having a claim for such funeral expenses or physicians charges may present to the surrogate's court a petition praying that the executor or administrator may be cited to show cause why he should not be required to make such payment. If upon the return of the citation it shall appear that the executor or administrator has received moneys belonging to the estate which are applicable to the payment of the claims for funeral expenses or physicians charges, and that the executor or administrator admits the validity of the claim or claims and the reasonableness of the amount thereof, the surrogate shall make an order directing the payment of the same, or of such part thereof as he may specify, within ten days thereafter. If the executor or administrator files an answer setting forth the facts, and therein disputes the validity of the claim or claims or the reasonableness of the amounts thereof the surrogate shall direct that the claim or claims so disputed be heard upon the judicial settlement of the accounts of such executor or administrator. If it shall appear that no money has come in the hands of the executor or administrator the proceeding shall be dismissed without costs and without prejudice to a further application or applications showing that since such dismissal the executor or administrator has received money belong to the estate. At any time after three months from the date of the former order if no answer was filed disputing such claim a further application may be made by petition stating the facts upon which the belief of the petitioner that there are moneys in the hands of such executor or administrator applicable to the payment of his claim, is based. Upon such further application the issuance of the cita-

tion shall be in the discretion of the surrogate. If upon any accounting it shall appear that an executor or administrator has failed to pay a claim for funeral expenses or physicians charges the amount of which has been fixed and determined by the surrogate, as above set forth, or upon such accounting, he shall not be allowed for the payment of any debt or claim against the decedent until said claim has been discharged in full, but such claim shall not be paid before expenses of administration are paid.

§ 2 This act shall take effect immediately

### AN ACT

To amend section thirteen of the Workmen's Compensation Act

The people of the State of New York, represented in Senate and Assembly, do enact as follows

Section 1 Section thirteen of chapter six hundred fifteen of the laws of nineteen hundred twenty-two entitled 'An act to amend the workmen's compensation law, generally,' is hereby amended to read as follows

§ 13 Treatment and care of injured employees [The employer shall promptly provide for] [in] An injured employee may, at the expense of the employer, employ or engage such medical surgical or other attendance or treatment, nurse and hospital service medicine, crutches and apparatus for such period as the nature of the injury or the process of recovery may require. [If the employer fail to provide the same after request by the injured employee such injured employee may do so at the expense of the employer.] The employee shall [not] be entitled to recover any amount expended by him for such treatment or services [unless he shall have requested the employer to furnish the same and the employer shall have refused or neglected to do so, or unless the nature of the injury required such treatment and services and the employer or his superintendent or foreman having knowledge of such injury shall have neglected to provide the same, nor shall] No [any] claim for medical or surgical treatment shall be valid and enforceable, as against such employer, unless within twenty days following the first treatment, the physician giving such treatment, furnish to the employer and the industrial commissioner a report of such injury and treatment, on a form prescribed by the industrial commissioner. All fees and other charges for such treatment and services shall be subject to regulation by the commissioner as provided in section twenty-four of this chapter, and shall be limited to such charges as prevail in the same community for similar treatment of injured persons of a like standard of living

§ 2 This act shall take effect immediately

## OPINIONS FROM SEVERAL SECTIONS OF NEW YORK STATE

From Nassau County—Real live work must be done this year by each County Society. The recent exposures in Connecticut and others in New York have served as an incentive to each County Society and to the State Society to more strenuous work than ever to the securing this year of a Medical Practice Act. Now is the opportune time to insist that the State Legislature pass a law which will prevent the re-enactment in New York State of the disgraceful occurrence in Connecticut.

Let each County Society keep in close touch with its legislators, ask them to the meetings of the Society, and take every opportunity to keep them informed as to medical progress and also of the wants and wishes of the medical profession. What was done in Queens County last year can be done in any County in the State. It appears that the introducer of the Chiropractic Bill last year wanted a renomination. He had already served seven terms. The president of the County Society told the powers that be that this man would not be acceptable to the medical profession of the County, and that if he was nominated, the medical profession would vote against him. Needless to say, he was not renominated.

A well-known politician said recently, "You doctors must get in politics if you want to get anywhere, and you must play the game as it is played by the politicians if you want to gain your ends. Don't sit and talk it over in the society meetings, and then let it drop, but go out from the meetings and do as the other fellow does and you will succeed."

A D JACQUES

From St Lawrence County—The whole country has been shocked and horrified by the discovery of the existence of numbers of bogus diplomas, and the officials of Connecticut have started a vigorous campaign to rid their State of such a dangerous situation.

The man with fraudulent credentials is without honor and little or no medical knowledge, and it is self-evident that he is a menace to the health of the community, but he is no more dangerous than chiropractors, and others of like ilk, who deny the great discoveries of scientific medicine and even the existence of contagious diseases, and trace virtually all morbid symptoms to an imaginary condition of the spine. Yet these men are virtually allowed to practice wherever they wish, are legalized in many States, and brazenly advertise their false doctrines everywhere.

Since we have so often failed in securing the passage of laws to protect the people, our chief hope lies in teaching them by the aid of intelligent statesmen and leading citizens to protect their own health and lives and to insist on a proper Medical Practice Act.

At the present time there is a strong ray of hope coming from the executive mansion in Albany, and there is promise of a brighter dawn when men like Chas W Eliot, ex-President of Harvard University, James R Angell, President Yale University, Right Rev Alexander Mann, Bishop of Pittsburgh, Cardinal O'Connell of Boston, Ellen F Pendleton, President of Wellesly College, and Chas E Hughes, Secretary of State, have organized a Society to fight false propaganda, and secure for the people the blessings of modern scientific medicine.

W B HANBIDGE

In Reference to the Workmen's Compensation Law—When any section of the Workmen's Compensation Law is erroneously or arbitrarily administered, it works an injustice to the manufacturing industry of the State, and the manufacturers suffer the consequences of increased cost production which in the last analysis the consumer pays. Having studied the workings of the Workingmen's Compensation Law as applied to eye injuries for several years, we are convinced that many of the awards made for such injuries are unjust to the manufacturer, and some means should be found for correcting this error which would ultimately reflect to the benefit of every consumer of manufactured products. After analyzing the question, we are convinced that the whole problem hinges on the fact that the Compensation Commission has never accepted or adopted a standard of measure for such injuries, and many of the awards are made based on direct or central vision alone, which is manifestly unfair to the employers, for it gives the injured an abnormally high percentage loss. So far it has been impossible to get the Commission to recognize the fact that sight is made up of three factors instead of one, viz Central, field, and stereoscopic vision, which bear a certain definite ratio to each other in visual economics, and therefore should be considered in making awards. Let the Legislature or the Commission correct this error that justice may be done to the manufacturing interests.

J F MCCAW

From Erie County—We need a Medical Practice Act with sharp enough teeth in it and strong enough jaw muscles to sink those teeth into the lawbreakers. We believe that a citizen who holds from the State of New York a license to practice a profession under the laws of that State has every right to demand and receive full protection against illegal practitioners of his profession. It should not be necessary for the doctor to expend time and energy in detective work to secure the prosecution of such offenders. Such burdens should logically rest upon the legal au-

thorities of the State, upon whom it should be mandatory to investigate fully and prosecute to the limit, every violation of the law brought to their attention from whatever source. Possibly the State Educational authorities should investigate and the Attorney General prosecute.

But picking up illegal practitioners of medicine only through casual complaints now and then will hardly serve to clean up the situation as it now exists. Some official dragnet must be cast to bring in possibly large numbers of such impostors who have gradually and insidiously established themselves in their illegal practice. For this purpose it would seem that a general registration would be advisable. I think it likely that the majority of the men in this end of the State would be in favor of such registration provided they were not compelled to repeat such registration annually with all of its attending affidavits etc. Possibly every three to five years would be satisfactory to the majority, but I suspect they would feel deeply aggrieved to be compelled to register annually, having in their possession the license of the State of New York establishing their status for life as a medical practitioner.

A burning question in legislation with us is what to do with chiropractic. Buffalo seems to offer a special welcome and protection to this particular variety of charlatan. Some of them advertise and accentuate the fact that they are graduates of this or that school of chiropractic—evidently thereby recognizing the fact that many of their colleagues in charlatanism have not even a three months' course in a so-called college to recommend their ability to the public. Suppose the State of New York should now legislate to license chiropractors on the basis of three or four years' thorough training in the fundamentals of medical science and suppose we as a profession support such legislation as a measure of protection to the public against ill trained, ignorant practitioners of healing, what attitude must we take toward this large list of ex-grocery clerks, delivery boys, and the like who will clamor for recognition as *de facto* practitioners entitled to licensure in their present state of ignorance and incompetency? While there is precedent in their favor for such recognition, I believe that we must take a firm stand in demanding that only those practitioners should be licensed under any such law who can furnish evidence of training for their work in an institution possessing some claims for recognition.

Dr. Vander Veer called the attention of the profession last month to the individual responsibility of the members of the Society in legislative matters. We at this end of the State are ready to say amen to this argument, but there is the reverse of the proposition which I want to emphasize for a moment.

Granted that the Society exists for advancing

the interests and welfare of its members and rightly demands the support and backing of every individual member is the Society on its part doing its whole duty or rendering the fullest possible measure of service to its members? I believe there is a chance for a radical change in the actions and reactions between the Society and its members. I mean by this, that if the Society should adopt a more aggressive policy in educating its members as to their duties to the Society, that the reaction would be proportionately better.

Specifically, what could the Society do? First, raise the dues. Second, spend some of this money from increased dues to full time secretaries. Third spend another portion of the money from increased dues in financing a systematic campaign of education on legislative matters throughout the State by these Secretaries. Fourth in addition to such field secretary work, let one or both of them be our official representatives in the matter of contact with our legislators.

Regarding the first point, the doctor now pays a paltry \$5.00 a year to his County Society treasurer and expects for this sum an insurance policy against illegal practitioners and all sorts of vicious legislation. Contrast with this small amount the larger and regular dues paid by members of labor unions, chiropractor associations, etc. Talk as we please about the dignity and high standard of the profession, we cannot expect to get results in our fight for protection without some sinews of war.

As to the second and third points, you can circularize, write editorials, hold meetings and what not, without a great deal of response from the average doctor. With a systematic personal campaign by a salaried employee familiar with all the complexities of the political and legislative situation, the members of the Society throughout the State could be reached and enlightened as in no other way.

Physicians do not realize the latent influence which they possess. At a moderate estimate each physician in this State could personally influence the opinion of twenty-five citizens among his clientele. By an intensive campaign along any given lines by the state field secretaries before suggested the profession could be wheeled into action in an unbroken front. The effect of such mass action on our part would be incalculable and of tremendously greater value in moving legislators than the official communications of our legislative committees, both State and County, not that the latter would not be needed, but their official vote would serve as the officer's command of "Forward."

G. R. CRITCHLOW

# LEGAL

By GEORGE W WHITESIDE, ESQ

"No one," said Mr Justice Field, of the United States Supreme Court, "has a right to practice medicine without having the necessary qualifications of learning and skill, and the statute only requires that whoever assumes by offering to the community his services as a physician that he possesses such learning and skill, shall present evidence of it by a certificate or license from a body designated by the State as competent to judge of his qualifications."

Every bill for the licensing of chiropractors in this State sponsored by the chiropractors has provided for the licensing without examination of those who have for a certain time been engaged in this State in the practice of chiropractic. Such a license would be a representation by the State to the public that the holder possessed the necessary learning and skill and was safe for the public to trust. The public have small opportunity of knowing the qualifications of practitioners and must rely upon the State's certification of the practitioner's learning and skill appearing upon the face of his license. If, under a waiver clause, chiropractors are to receive, by wholesale, licenses to practice chiropractic and such persons are not judged of their qualifications by anybody designated by the State, then the State will be a party to false representation to the public. Such an act cannot be called an act for the regulation of chiropractic without doing violence to the truth—it would be an act for the granting of immunity to present lawbreakers by conferring upon them a right of license based upon past wrongful conduct.

If Judge Field was right when he said that a license to practice was evidence of learning and skill from a body designated by the State as competent to judge, then a license granted by the State under such a waiver clause without any test of the qualification of the applicant is false evidence and a fraud upon those who rely upon the views expressed by our highest court. To grant a special privilege to a select few by legislative act offends our sense of justice, but in so doing to make a false representation of the competency of that privileged class without test or examination does violence to the conscience.

The chiropractor continues to say that he does not practice medicine as that term is defined by statute. Let us take a few quotations from a text-book published by the Palmer School of Chiropractic, being a compilation of the writings of the founder and edited by his son in 1921. This was written for chiropractic students to prepare them for their practice.

The Palmers say

"Our business, as chiropractors, shall be to relieve human suffering, no matter whether it comes from a corn or cancer. The relief given bunions and corns by adjusting is proof positive that subluxated joints do cause disease."

"To remove the direct cause of typhoid fever, local inflammation, replace the displaced dorsal vertebrae, remove the pressure on nerves thereby allowing them to perform their normal amount of function."

"We, as chiropractors, should know just where to adjust for acute as well as chronic diseases. Acute ailments should be relieved by one specific adjustment, while chronic diseases may take weeks or months."

"Recently, a graduate chiropractor had an opportunity to show his skill in a family of smallpox patients."

"I found in this case (diphtheria), as I have always found, a displaced dorsal vertebra and emanating from the occluded foramen a sensitive nerve which covered the membrane of the throat with its branches."

"I knew throat diseases have their origin in the dorsal vertebrae and that nerves may be inflamed and express too much heat."

"For ingrowing toe nails adjust the last lumbar. Only last evening I relieved a bad case of ingrowing toe nails by one adjustment."

"A chiropractor repairs by adjusting, fixing and replacing."

Speaking of typhoid fever, this author says.

"Others as well as myself have relieved typhoid fever by one adjustment at center dorsal."

Speaking of poisoning, this founder of the chiropractic cult says

"A few years ago I was called to the infirmary to attend one of the students who was suddenly ill with stomach and throat trouble. One adjustment at SP gave immediate relief. The next day I was called to the same man with the same ailment with the same result. The following day was Sunday. I was absent from home until sundown. Upon my return I found him in convulsions. I then saw he had taken poison. An examination of his room disclosed the fact that he had sought to take his life by corrosive sublimate."

Citing further a case of his wife having been poisoned by veal sausage, the author continues thus

"These are the only cases of accidental poisoning I can cite the reader to where chiropractic has been used with success. Without further experience I would advise the chiropractor to adjust immediately and send for a physician. If the patient is relieved by the time the physician has arrived, well and good. If not, then you have complied with public educated demands."

The author at one point in his book states the type of adjustment for a long list of diseases, alphabetically arranged. Fifty-seven pages are devoted to reciting the adjustment for each disease mentioned.

"I have on two occasions caused plenty of hair to grow on bald heads and on two heads have changed gray hair to black by adjusting the 6th dorsal towards the right shoulder."

"For Barber's Itch adjust the 5th dorsal"

"For cataract of the eye, stand on the right side and adjust the 6th dorsal towards the left shoulder"

"For chicken pox adjust the 5th cervical. I have always been successful in relieving either chicken pox or smallpox by one adjustment"

"Consumption, a wasting disease of the lungs or bowels, adjust accordingly"

Diphtheria Adjust 5th dorsal for any of these throat affections standing on the right side and throwing the vertebrae in the direction of the left shoulder

Endocarditis Inflammation of the endocardium the lining membrane of the heart usually associated with rheumatism Adjust the 4th dorsal

"Gangrene. Local death of a part. When the lifeless part has become black with no feeling or circulation in it, mortification has set in. Adjust the patient into the hands of another practitioner"

"Gonorrhea. I have been successful in adjusting for gonorrhea and gleet Adjust 2nd lumbar

"Insanity Adjust 4th or 3rd cervical"

"Lead Poisoning. A disease largely confined to plumbers. This disease with general symptoms calls for adjustment at 6th dorsal."

"Organic Diseases of the Heart Adjust for either functional or organic diseases of the heart at the 4th dorsal"

"Pneumonia Pneumonia should be relieved by one adjustment in the upper dorsal region

"Tapeworm Improve digestion by adjusting the 5th dorsal to the right."

Typhoid Fever Adjust the 6th dorsal and no other

Typhus Fever Adjust 6th dorsal

Let us now return from the chiropractic schoolroom, where diplomas are given to these hand magicians to treat the diseases specified above to the court room

Does the chiropractor in treating or rather maltreating patients by the formulas above practice medicine as it is defined by law? The Appellate Division in the case of *People v. Ellis* (162 App Div 288), said in 1912

"Appellant's office sign, his circular and professional card, as well as his own frank admissions as a witness, all show that he holds himself out as able to diagnose and prescribe for pain disease and injury. Rubbing and pressure on the human joints are old therapeutic agents. When accompanied by such attempts at diagnosis as the statement that a patient's pains in the ankle were from the spine having come out of alignment through displaced vertebrae appellant acts come within the statutory definition of the practice of medicine."

"He, therefore, was guilty of the misdemeanor of practicing medicine without a license or being registered under the Public Health Law"

In 1910 in the Mulford case, the Appellate

Division affirmed a conviction where it appeared from the evidence that the defendant had an office, where he received patients and treated them for physical ailments, and received compensation therefor, that he gave no medicine and prescribed none, that he performed no surgical operations and used no surgical instruments, that his entire treatment consisted of the laying on of hands and manipulation, breathing, rubbing his hands together, and that his treatment was beneficial to his patients. This man was held guilty of practicing medicine and his conviction affirmed by the highest court.

Numerous cases under these authorities have been prosecuted against chiropractors in the lower courts and the defendants convicted and fined. It needs no argument to prove the falsehood of the chiropractor's claim that he does not practice medicine. The records of our courts to the highest court in the State during the last thirteen years show conclusively that he does practice medicine in violation of law. His present claim to registration and license without examination rests upon a long-continued career as a lawbreaker with knowledge that he is such and apparent pride in the fact.

If any form of licensure is to be granted to chiropractors in this State, the State will be a party to permitting the chiropractor to practice a thoroughly scientifically unsound cult and, as stated in the Mulford case by Judge Williams, 'impose upon the unfortunate sufferers, who like the poor, are always with us and many of whom need the protection of the State against quacks in and out of the profession of medicine."

Chiropractic is scientifically unsound and should be fought as a plague—its practice here is a crime which no political expediency can condone. Legislation that makes past lawbreakers a privileged class and represents as scientific what is foolish nonsense and dangerous to the public health is not a proper exercise of the State's power—for to return to the words of Mr. Justice Field "The powers of the State to provide for the general welfare of its people authorizes it to prescribe all such regulations as, in its judgment will secure or tend to secure them against the consequences of ignorance and incapacity as well as of deception and fraud" G. W. W.

## MORPHINE POISONING ALLEGED AS CAUSE OF DEATH OF INFANT

After more than thirty years of practice as a general practitioner, a physician was recently subjected to the trial of an action where the plaintiff sought to charge him with negligence in having wrongfully prescribed for the plaintiff's intestate, a child of two years and eight months of age and having caused the death of said child by an overdose of morphine. The physician had

never attended the said child or his family before and received a hurry call one afternoon. On arrival he found the child markedly cyanotic with labored breathing and wheezing, accompanied by a rapid pulse the child having been in this condition since the preceding night. By the child's parents the physician was given a history of pneumonia about a year previous and

frequent attacks of bronchitis and asthma, and that the child had been attended by various physicians

To relieve the acute asthmatic attack from which the child was then suffering a hypodermic of 5 mm solution of adrenalin chloride 1/1000 was administered. After a wait of about fifteen minutes, and this medication having no effect upon the child, a hypodermic of atropine sulphate gr 1/300 was administered, which likewise did not relieve the asthmatic spasm, and within about half an hour he hypodermically administered gr 1/32 morphine combined with 1/800 gr of atropine sulphate. Shortly after this the breathing became normal and the wheezing stopped and the cyanotic condition disappeared.

After being with the child for an hour and a half or more, he left at about 5 30 P M, instructing the parents to notify him at about 7 30 P M the condition of the child. No further word was received by this physician from the parents of the child until he was served with a summons and complaint in an action seeking to hold him responsible for the death of the child.

It appeared that after the defendant physician had left the home of the patient, the child's condition grew worse and the parents did not call the defendant but brought in another physician, who found the child generally cyanotic, with spasmodic breathing at a rate of about three a minute. An examination by this physician of the child disclosed pinpoint pupils, no obstruction to respiration, and physical stimulation caused an increase in respiration and caused the child to open its eyes. Upon the advice of this physician the child was taken to the hospital, a tentative diagnosis having been made of opium or morphine poisoning. At the time the child was received at the hospital he was pulseless, the lips cyanotic and barely breathing, with pupils very small and all reflexes abolished. Hypodermic injections of caffeine were given, a stomach lavage and also colon irrigation and coffee enema. A drop of croton oil was given into the stomach and hot water bags placed about the child. The child's color and respiration improved until the respirations reached about fourteen per minute. The carotid pulse became palpable and later the radial pulse was palpable. About two hours after the child had been received at the hospital he suddenly stopped breathing and could not be resuscitated.

At the hospital a diagnosis of acute poisoning by morphine was made. An autopsy was performed upon the child, which showed that the lungs were congested, and likewise the liver was somewhat congested. The stomach was found to contain an ounce or two of grayish food content. The intestines contained fluid yellowish fecal content and the lymph node and follicles

of the intestines were large. The larynx and trachea contained a thick muco pus, yellowish in color, which extended down into the finer ramifications of the bronchi. The thymus showed lymph tissues present and weighed about 20 grammes. An anatomical diagnosis of acute muco purulent bronchitis with marked congestion of viscera was made and the cause of death was given as acute muco purulent bronchitis—acute morphine poisoning. A pathological examination of the brain and liver showed a very faint trace of morphine and a very small amount of caffeine.

Upon the trial the parents testified that the child was not ill when they called the defendant, but that there had been cases of diphtheria in the house in which they lived and the defendant was called solely out of precaution, and that when the defendant arrived at the house the child was playing upon the floor. They further testified that the child had been previously ill, but on cross-examination it was shown that the child had had pneumonia, had also had its tonsils and adenoids removed and at times had been under the care of other physicians.

To sustain the cause of action the plaintiff called a physician as an expert witness, who in answer to a hypothetical question testified that the administration of the morphine by the defendant was not the proper and approved practice and caused the child's death from morphine poisoning.

Under cross-examination of this expert it was shown that he had never in his practice administered morphine to a child of this age and that he had no personal knowledge of the effects of morphine upon such a child, that he attempted to justify his conclusions by reference to a book on children's diseases which was written more than twenty years ago. He further testified that the abnormal size of the thymus was not a contributing cause to the death of the child and that the child did not die of status lymphaticus.

In behalf of the defendant there testified as experts two physicians specializing in pediatrics of eminence and unquestioned standing, and who in their testimony stated that they had many times administered similar doses of morphine to children of the age of the deceased suffering from bronchitis and asthma, and that it was a recognized procedure among physicians. They further testified from their own experience and from research that the thymus of this child was about four or five times the normal size and was sufficient to cause the death of the child from status lymphaticus.

After three and one-half days of trial, the court held that the physician produced by the plaintiff did not possess sufficient qualifications to enable him to express an expert opinion in the case, and therefore the court dismissed the plaintiff's complaint.

# CORRESPONDENCE

We are pleased to print the following open letter from Dr John J A O'Reilly together with the reply of Dr Vander Veer

Brooklyn N Y, December 24 1923

Hon Alfred L. Smith, Governor  
Hon Daniel F. Farrell, Senator  
Hon Michael J. Reilly, Assemblyman

I wish to place before you, in anticipation of the opening of the 1924 Legislature some facts with relation to the probable introduction of a Medical Practice (Annual) Re Registration Bill which the expose of the St. Louis Medical Diploma Mill forecasts

In this County of Kings, when the Compulsory Health Insurance Bill of 1919 was being exploited a threat was made by its proponents

If you refuse to help make operative Compulsory Health Insurance, if passed, your licenses to practice Medicine will be taken from you under the Police Power of the State

That threat cannot be made good until and unless the Statutes are changed so as to amplify the Police Power by investing somebody or some bureau with plenary discretionary power to grant or deny re-registration to any Doctor which would make such person or Bureau independent of the Executive and Legislative branches of the State Government and beyond the control of the Judiciary under the controlling decision on the Police Power of the State as applied to a license (*Dr Dent v State of West Virginia*, 129 U S Sup Ct Rep, p 114)

The 1920 (Kenyon) Bill No 840 and the 1922 (Bloomfield) Bill No 536 provided just this type of power which would insure the fulfillment of that threat. Efforts were made by me and others to induce the proponents to change the discretionary word *may* to the mandatory word *shall* so that a Doctor who might be denied re-registration would have his day in Court and the merits of such denial determined and the denial affirmed if just and reasonable cause existed or if the Petitioner failed to show compliance with the fundamental requirements for licensure, but the proponents and propagandists persistently and consistently refused to make such change

You will please understand that this alteration from the word *may* to the word *shall* was suggested without any surrender of my publicly stated position that the Practice of Medicine has been kept clean by the blood of its martyrs throughout the ages and that we need a Re-Registration (annual or otherwise) just as much as a cat needs two tails and that law and precedent exists and has existed for the designation by the Attorney General of a Special Deputy Attor-

ney General to act in concert with a District Attorney in sympathy with the enforcement of the Medical Practice Act or to supersede one who might be derelict in his duty

I wish to request my Senator and Member of Assembly to see to it that I am kept in closest touch with such Re-Registration bills as may be introduced and that copies be sent me and that I shall look to them to not only vote but work against any measure that will tend to the fulfillment of the above recited threat and the *panelization* of the Profession of Medicine as evidence of their good faith to me and the People of this District County, and State who have a right to protection from the plans of those who parade under the cloak of the Brotherhood of Man

Very truly yours,

JOHN J A O'REILLY, M D,

MY DEAR DR. O'REILLY

Thank you exceedingly for your letter of December 24th, which reached me yesterday—owing to our backward mail system at this season of the year

The situation as it has been brought forth in the State of Connecticut, and in our own State as regards some professional conditions, seems to warrant that efforts be made to help the medical profession, and as the Governor now is in accord with our thoughts to a degree, I am in favor of some type of re registration such as you will see appearing in the next issue of the JOURNAL

Under the circumstances it will naturally mean much work to keep the bill within limits, so that there will be no question as to the physicians being denied the right to obtain their credentials for practice in other States or their continuing to practice in this State, provided they simply register and the matter of the fee is only a question of how much the physicians shall contribute toward the State funds to protect themselves and aid in protecting the public

I have forwarded your letter to the Editor of the JOURNAL, and I think there will be no question about its publication, as the columns of the JOURNAL have been opened wider than ever before to the reasonable comments offered by the members of the Society "for" or "against" any proposed measures

Very sincerely yours,

JAMES N VANDER VEER,

Chairman Committee on Legislation,  
Medical Society of the State of New York

## THE PHYSICIANS' HOME IN CANAEDAEA

The Physicians' Home was established in 1921, for the care of aged physicians who were in destitute circumstances. Dr Robert T Morris was the leader of its founders and through his influence the House of Delegates of the Medical Society of the State of New York approved the Home in 1920.—THE EDITOR.

The Home is located on a high plateau overlooking the historic Genessee, far-famed for its scenic beauty. The physical features of the Home include a fertile farm of 186 acres, well-filled barns and silos that provide feed for a dairy of twenty-five cattle. The housing quarters for the physicians, who are fortunate enough to be here, is a commodious structure, modern in every particular, having its own electric lighting plant, vapor heating system, bathrooms with hot and cold water. An annex, consisting of six large bedrooms with large closets in each, and two assembly halls, is now practically completed. With these additional facilities others of the profession may be accommodated.

I intimated in the outstart of this article that I was pleased with the spirit that prevailed at the Home during the holidays. I know from actual experience that the atmosphere about this Haven of Rest is always inviting and peaceful. It is this aspect of the Home that I desire more particularly to dwell upon.

The first thing that impressed me very much was the individual attention given every physician in the Home. I have made a number of surveys of various institutions in New York City, but in not a single instance have I observed such devotion and self-sacrifice on the part of those in authority.

The superintendent of the Home, Mr. Carl Fritz, and the matron, Mrs. Carl Fritz, are unusually capable, conscientious and painstaking in their efforts to please all concerned. Since they took charge of the Home it has improved and prospered beyond words to describe.

Everything connected with the place is being systematized. Efficiency seems to be the keynote at all times, this coupled with an intense interest in the good cause for which the Home exists, secures the maximum service for all the guests at this Unit of The Physicians' Home.

The dawn of Christmas found the exterior environment of the Home covered with a blanket of white as far as the eye could see. The forests primeval presented a scene, rather a feast long to be remembered.

The interior of the Home was not that of an institution, but rather that of a home in the true

sense of the word. In the spacious drawing room stood a large Christmas tree, all gay with trimmings galore. At its base were piled gifts for all. Surely the Spirit of Christ prevailed.

The Christmas dinner—Oh, My! only a New Yorker could fully appreciate the bounteous repast. The menu included roast turkey à la Mountain style, with all the usual garnishings, mashed potatoes, pickles, two kinds of fruit salad à la Fritz, brown gravy, cranberry sauce, celery, plum pudding with sauce, coffee, candy and nuts.

A high power, four tube, Grebe Radio with a large Western Electric loud speaker, provided ample musical entertainment direct from Pittsburgh, Schenectady, Buffalo, Rochester and Chicago. The Radio, in fact, is a valuable asset to the Home, for practically every night it entertains by means of lectures, plays, sermons, concerts, vocal and instrumental solos, weather and trade reports, sport talks, etc.

Summarizing—This Unit of The Physicians' Home is complete in itself, equipped in a manner conducive to the welfare and comfort of its guests. The intellectual welfare of its occupants is taken care of by means of a well-selected library, current reading matter, such as the *Literary Digest*, *The Atlantic Monthly*, *The Living Age*, *New York State Medical Journal*, *American Medical Association Journal* and several of the Metropolitan dailies, including the *New York Times*, are daily received at the Home.

The physical welfare of its guests are met by an altitude of about 1900 feet, large, warm, well-ventilated private bedrooms, two large sunny drawing rooms, a long veranda, baths and last, but not least, the very best of food. The dairy mentioned above supplies real cream for the coffee and other beverages. Everyone may have plenty of pure, wholesome milk at all times. Substantial cuts of meat are supplied every day. Plenty of apples, squash, potatoes, etc., are grown on the farm, not for sale, but for the health of its guests. Fresh eggs, not cold storage eggs, are always on hand. This, certainly, is enough to make a New Yorker, even if "It is Great to be a New Yorker," green with envy.

Suffice to say that even a casual observer could not help but realize that The Physicians' Home at Canaedeaa is more than an institution; it is a Home destined in the near future to serve a large number of the Medical profession, who may be through various reasons incapacitated and unable to continue active service.

Sincerely submitted,

J E WARDLE

## NEWS NOTES

### GOLDEN ANNIVERSARY

Dr J H LaRocque of Plattsburgh celebrated his seventy-fifth birthday on December 3d. On this occasion he was tendered a banquet by the entire medical profession of Clinton County. A beautiful souvenir program with the Doctor's picture on it was prepared, and at the conclusion of the banquet Dr W P Taylor of Mooers, the next oldest practicing physician in the county, presented a loving cup. During the evening letters of congratulation were read from Governor Smith, Health Commissioner Nichol, and various other State and local officials expressing their congratulations. Dr LaRocque has been over fifty years in practice, most of that time in Plattsburgh and for over twenty-five years has been Health Officer of Plattsburgh.

### THE AMERICAN CONGRESS ON INTERNAL MEDICINE—ANNOUNCEMENT

The Eighth Annual Clinical Session of The American Congress on Internal Medicine will be held in the Amphitheatres, Wards, and Laboratories of the various institutions concerned with medical teaching at St Louis, Mo., beginning Monday, February 18th, 1924.

Practitioners and laboratory workers interested in the progress of scientific clinical and research medicine are invited to take advantage of the opportunities afforded by this session.

Address enquiries to the Secretary General Frank Smithues, Chicago, Ill.

### AN ADVANCEMENT

The position of Busch Professor of Medicine in Washington University, St Louis has been given to Dr David P Barr, who has been Assistant Professor of Medicine in the Cornell University Medical College. Dr Barr is an Assistant Visiting Physician at Bellevue Hospital, New York City, and is one of the younger group of physicians who are following in the footsteps of illustrious predecessors, such as Dr Austin Flint, Francis Delafield, Edward G Janeway, William H Welch and William K. Polk.

### NEW YORK POST-GRADUATE MEDICAL SCHOOL AND HOSPITAL

The following Friday Afternoon Lectures will be given at 5 o'clock at the New York Post-Graduate Medical School and Hospital during the month of February.

February, 1st—Recent Advances in Diagnosis

and Treatment of Patients with Diseases of the Heart Medical and Surgical Aspects (With lantern slides) Dr Robert H Halsey.

February 8th—The Symptoms and Treatment of Injuries to the Skull and the Vertebrae. Dr Charles E. Elsberg.

February, 15th—Laboratory Aids in the Diagnosis and Treatment of Syphilis. Dr Ward J MacNeal.

February 29th—Cleft Palate. Dr Harold S Vaughan.

### TYPHOID CARRIER'S SUIT AGAINST JAMESTOWN

A damage suit was recently entered against the City of Jamestown as the result of the discovery of a typhoid carrier on a dairy farm near that city, where nineteen cases of typhoid fever occurred during the past summer.

Dr Mahoney, District State Health Officer, early determined that the epidemic was milk-borne, and after examination reported that the dairymans wife who occasionally washed cans milking machine, etc., was a carrier, although a positive history of the disease could not be secured.

The most interesting item in connection with this case occurred this fall when the laboratory of the State Department of Health reported to Dr Mahoney that several specimens of feces containing typhoid bacilli had been submitted from four members of a household who had never been reported as typhoid cases in a nearby village. Upon investigation Dr Mahoney discovered that the doctor who sent the specimens to the laboratory had "faked" all the names and addresses, and that these four specimens were from three individuals residing upon the dairy farm which had previously been under investigation. Furthermore by this attempted underhandedness upon the part of the physician, a second carrier was discovered upon the farm. It is understood that the suit has been withdrawn.

The majority of outbreaks of typhoid fever which have been investigated by the State Department of Health are the result of food handling—especially of milk—by typhoid carriers. The discovery of the carriers is nearly always difficult and is frequently followed by threats of suits for damages for loss of revenue. Yet the restrictions imposed by the Health Department are seldom burdensome and if they were followed conscientiously there need be no financial loss to the carrier, or the employer.

## MEDICAL SOCIETY OF THE COUNTY OF ALBANY

The final meeting for this year was held at the County Court House at 8 45 P M on Tuesday, December 11th, 1923, with the president, Dr Fromm, in the chair, sixty-five members were present Drs Lawrence J Early, Marion Collins, and Harold Rypins were elected to membership, and Drs G W Timmers and John C McGarrahan were accepted by transfer from the Rensselaer County Medical Society

Communications regarding the Harding and the Gorgas memorials were referred to the incoming administration

The Society appropriated one hundred dollars to aid German Medical scientists

The following officers were elected for 1924 President, Edgar A Vander Veer, Vice-President Harry L K Shaw, Secretary Louis J De Russo, Treasurer, John Phelan, Censors Frederic Curtis, Joseph Cox, Alvah H Traver, Joseph P O'Brien, and Nelson K Fromm Delegates to State Society William P Howard, Arthur M Dickinson, and Clinton Hawn Alternates

Thomas W Jenkins, Tiffany Lawyer, and H M Grogan

Dr Vander Veer reported on some prospective medical legislation and especially on the re-registration bill which is being placed for the Governor's consideration It was carried that this Society go on record as approving the tentative re-registration bill, that we urge our legislative committee to aid in its passage, and that the Secretary send a copy of our action immediately to the Secretary of the Medical Society of the State of New York Motion carried

Dr Wiltse, the City Health Officer, then informed the Society of the exact situation regarding Smallpox cases in Albany He said that the situation was well in hand, and that there were 17 cases in total He also advised physicians to vaccinate at large in their judgment and to help dispel false rumors to the public A unanimous vote of confidence was given Dr Wiltse, and he was commended on his efficiency in handling the situation, and was also pledged the co-operation of all the members

## BRONX COUNTY MEDICAL SOCIETY

The annual meeting of the Bronx County Medical Society, held at Concourse Plaza on December 19th, 1923, was called to order at 8 50 P M, the First Vice-President, Dr Podvin, in the chair

The following applicants were elected to membership Sigmund Dreiblatt, Harris Feinberg, Harold Goldstein, Abraham R Harber, Abraham Jucovy, Isidor N Kahn, Mark G Kantor, Samuel Kastenbaum, Israel Kibel, Max Pollock, Saul Rutstein, Henry D Sherman, Israel Shmelkin

The Reports for the year 1923 of the Officers and Committees were presented

Dr Heller moved that the Annual Reports be accepted and be made a part of the minutes of our meeting This motion was carried

Under New Business, Dr Rost moved that the annual dues of The Bronx County Medical Society shall be increased to \$5 00 This motion was seconded and carried

Dr Landsman introduced the following resolutions

"WHEREAS, The Bronx County Medical Society has sustained a severe loss in the death of its honored associate, J Kent Worthington, M D

"Resolved, That The Bronx County Medical Society record the sense of its loss in the death of Dr Worthington and that a minute hereof be placed on the records of the Society, and be it further

"Resolved, That a copy of these Resolutions

be transmitted to the family of our departed member "

Dr Landsman also introduced the following Resolutions

"WHEREAS, The Bronx County Medical Society having sustained a severe loss in the death of its honored associate, Edward F Brennan, M D, a Charter Member and a Member of the Board of Censors during the years 1919 and 1920,

"Resolved, That The Bronx County Medical Society record the sense of its loss in the death of Dr Brennan and that a minute thereof be placed on the records of the Society, and be it further

"Resolved, That a copy of these Resolutions be transmitted to the family of our departed member "

Dr Rost moved that the above Resolutions be adopted This motion was seconded and carried

Dr Van Etten reported for the Decennial Dinner Committee

Dr Amster moved that a letter be sent to Governor Smith commending him for the appointment of a Commission to investigate illegal practitioners in the State of New York This motion was carried

Dr Gitlow moved that a vote of thanks be extended to the Chairman of the Committee on Legislation, Dr Cuniffe, for his splendid work during the year This motion was carried

Election of Officers, Censors, and Delegates for the year 1924 being in order, the President declared the polls open at 9 30 P M Drs Ide Keller, and Landy were appointed as Tellers

A fifteen-minute recess was ordered

The Chairman declared the polls closed at 10 30 P M The Tellers subsequently presented the following report

Total number of ballots cast 163  
Void ballots 2

The following officers were elected for 1924 President Edward C Podvin, First Vice President Simon M Jacobs, Second Vice-President Edward R Cunniffe Secretary, J J Landsman Treasurer, J Adlin Keller Board of Censors Sidney Colin and Samuel Gitlow Delegates

Harry Arnow, Edward R Cunniffe, Norman Roth and Nathan B Van Etten Alternates Martin J Loeb, Arthur J O'Leary, and Samuel Rosenzweig

The Scientific program then proceeded as follows Case Report Case of Congenital Heart Disease with Interesting Complications, J S Fisher

Papers

1 Peritonissilar Abscess and Its Treatment, I M Heller

Discussed by Drs Jacobson, J J Goldstein S M Jacobs Rosenzweig and Lobell

2 A Clinical Study of Sterility in the Male Maximilian Zigler

Discussed by Drs Joseph Roth and Nagorsky

## THE MEDICAL SOCIETY OF THE COUNTY OF CAYUGA

The annual meeting was held in the Osborne House, Auburn, November 27th, 1923 The meeting was called to order by the President, George H Beers, M D, at 7 P M, and the polls were declared open for the election of officers

The feature of the evening was a social supper, given to the physicians and their wives The company was entertained with selections by a quartette under the leadership of Dr Bull

Dr Gibson B Mick of Auburn, spoke on his recent trip to Europe

Dr Beers gave a practical paper on deafness, which was interesting to the ladies as well as to their medical husbands

The attendance at the meeting and supper was seventy-five, including the wives of the members

It would seem that Cayuga County is a close second to Rockland in the attendance of its members, and excels Rockland, in that it included the wives at its function.

The following officers were unanimously elected for 1924 President, Seth N Thomas, Vice-President, Asel James Bennett, Secretary, John W Copeland, Treasurer, F A Lewis Censors Chairman, George H Beers, Clinton E Goodwin, Raymond C Almy, Cornelius F McCarthy, Milo LeRoy Seconib Delegate to the State Society, Harry S Bull Alternates John W Copeland, Asel James Bennett Dunlap Snow Augustus B Chidester and Earl J Kempton were elected to membership and Arthur K Bates and G Perry Ross were accepted on transfer

## MEDICAL SOCIETY OF THE COUNTY OF ROCKLAND

The members of the Medical Society of the County of Rockland met at the County Seat New City, on the afternoon of December 5th for their annual meeting and dinner A serious after-dinner speech was made by Dr Orrin S Wightman, President of the New York State Medical Society outlining the new lines of work which the State Society is undertaking Speeches of a less serious nature were made by Dr Daniel S Dougherty, Secretary of the New York County Medical Society, Dr Frank Overton, District State Health Officer, and Drs J C Dingman and George Leitner of the local Society

The former officers were re-elected as follows President R O Clock Pearl River, Vice President Royal F Sengstacken, Suffern, Secretary, Robert R Felter, Pearl River, Treasurer Dean Miltimore Nyack Censor Robert R Felter, Merton J Sanford Ralph De Baun M J Sullivan John Sengstacken Delegate to the State Society for two years

George A Leitner Alternate Charles D Kline The President appointed the following committees Legislative George A Leitner, Chairman, Charles D Kline, John Sengstacken, Public Health Committee, John Dingman, Chairman, M J Sullivan, William R. Sittler

Harold E Bogart, of Suffern, was elected to membership, and Robert W Reid, of Nyack, was accepted by transfer from the Medical Society of the County of New York

The dinner is an annual affair, and is a great promoter of morale and of co operation among the doctors of Rockland County About forty practising physicians are listed in the directory of Rockland County, thirty-nine of whom are members of the County Society and thirty eight had paid their dues at the time of the annual meeting Forty-one doctors attended the dinner

It would seem that Rockland County holds the State record for proportion of membership to the practitioners of the county Let us hear the records from other counties

# PRUNES

The patter of tiny feet was heard from the head of the stairs Mrs. Beaconstreet raised her hand, warning her visitors to silence "Hush!" she softly said "The children are going to deliver their good-night message. It always gives me a feeling of reverence to hear them—they are so much nearer the Creator than we are, and they speak the love that is in their little hearts never so fully as when the dark has come. Listen!"

There was a moment of tense silence, then, "Mamma! mamma!" came the message in a shrill whisper "Wentworth has apprehended a cimex lectularius\*!"

\* nocturnal hemophage yecept the "crimson rambler"

## STEP ON THE GAS

A handy little accessory appeared at the Motor Show in the form of a case containing a complete first-aid outfit. This happy idea dispenses with any irritating need for caution while driving—*The Passing Show* (London)

## SHE WAS ALL RIGHT

Doctor No. 1—Did you hold the mirror to her face to see if she was still breathing?

Doctor No. 2—Yes, and she opened one eye, gasped, and reached for her powder puff

## HELEN

Often  
Men say that beauty is marred  
By intellect.  
Yours is not marred so,  
For if you had within you  
One glimmer of brain—  
No matter how you used it—  
I might perhaps forgive you  
For being  
Homely as Hell

## THE WAY IT FELT

Little Johnnie, aged six, had been to church, and had displayed more than usual interest in the sermon, in which the origin of Eve had been dwelt on at some length.

On his return from service, there being guests at dinner he had also displayed a good deal of interest in the eatables, especially the pie and cakes.

Some time afterwards, being missed, he was found sitting quietly in a corner with his hands pressed tightly over his ribs, and an expression of awful anxiety on his face.

"Why, what on earth is the matter?" asked his mother in alarm.

"Mamma, I'm afraid I'm going to have a wife," little Johnnie replied—*Brisbane Mail*

Alice for the first time saw a cat carrying her kitten by the nape of the neck. "You ain't fit to be a mother," she cried, scathingly. "You ain't hardly fit to be a father!"—*Youth's Companion*

## FAVORS NEW TYPE OF RUM CHASER

—Headline

For our part we have met every type of rum chaser there is and we are in favor of abolishing some of them, rather than bringing new types into existence.

All too well do we know the type that drops into one's office toward closing time, turns the conversation to prohibition and leads it deftly from there to the idea of an immediate drink to be provided by his host. He is one we could get along without. And we could spare the egg who hangs around the entrance to the club locker room waiting for an acquaintance to come in for a nip.

We feel perfectly sure that there are some men who spend fifteen hours a day at this more or less productive occupation. They have cost us a pretty penny for entertainment.

The others are innumerable, the boys who carry corkscrews always turn up just when some one is trying pounding a bottle against the wall. There must be thousands and thousands of corkscrews sold to men who never do a dollar's worth of business with a bootlegger.

Every time we read about Poison Rum Taking Its Toll we pray that some of the charity patients have had their tastes of the treacherous stuff.

—EDWARD HOFF *N Y Tribune*

## HIS KIND INVITATION

Professor (after trying first-hour class)—"Some time ago my doctor told me to exercise early every morning with dumb-bells. Will the class please join me tomorrow before breakfast?"—*The Watchman-Examiner*

## PATERNAL STYLE

"Now, my little man," said the barber to a youngster in the barber's chair, "how do you want your hair cut?"

"With a hole in the top like dad's," was the reply.  
—*Pittsburgh Sun*

## RUSH HOUR

Lady, copious and dull  
Balanced blithely on my toes  
While your weight each second grows  
As the swaying subway goes  
Might it penetrate your skull  
That, one inch to right or left,  
There's a spot of floor space left?

Little man of ample girth  
Leaned against my aching back,  
(Hear the bones and muscles crack!)  
Swayed by all the panting pack  
Moved at times to fiendish mirth  
Can't you, as the blocks fly by,  
Lean against some other guy?

Lord! Another surging crowd,  
Panting, pushing, struggling in,  
Fighting thru infernal din,  
Holding on by teeth and chin,  
Faces twisted, strained and cowed  
Every second takes its toll,  
What an aid for birth control!

FEBRUARY 1, 1924

## RESULTS OF ACTIVE IMMUNIZATION WITH THE NEW MIXTURE (1/10 L +) OF TOXIN-ANTITOXIN IN THE PUBLIC SCHOOLS OF NEW YORK CITY (MANHATTAN AND THE BRONX)\*

By ABRAHAM ZINGHER, M.D. Dr. P.H.  
NEW YORK CITY

THE extensive work in active immunization with diphtheria toxin-antitoxin which was carried on during the past three years in the schools and baby health stations of this City has enabled us to make a number of interesting observations and has led to certain conclusions as to the type of mixture of toxin-antitoxin that would have to be used before we could hope for a wide acceptance of this form of protection against diphtheria.

Until a short time ago we had used quite extensively mixtures of toxin-antitoxin that contained from 3 to 6 L + doses of toxin per c.c. These mixtures were prepared from strong toxins which were only slightly diluted before the addition of the antitoxin. They contained relatively large amounts of different proteins which gave rise to the disagreeable local and constitutional symptoms associated with toxin antitoxin immunization. Chief among these reacting substances is the autolyzed protein of the diphtheria bacillus, which is contained in the diphtheria toxin broth culture.

One of the important questions that had to be

Read at the Annual Meeting of the Medical Society of the State of New York at New York City May 22 1923

decided was whether a mixture of toxin antitoxin with a larger number of L + doses per c.c. would give better immunity results than one with a smaller number of L + doses. We therefore used different mixtures in the schools, containing between 3 and 6 L + doses per c.c. We found that mixtures with the larger number of L + doses were not more efficient than those with the smaller number of L + doses as long as the mixtures were equally toxic (underneutralized). In fact we noted that mixtures with the smaller number of L + doses per c.c. but showing greater toxicity for the guinea-pig, gave better immunity results than those with the larger number, which were more neutralized. Table I illustrates this point.

On the basis of these data Dr. Park asked Dr. Banzhaf to prepare mixtures of toxin antitoxin, which contained only a fraction of an L + dose of toxin per c.c. These mixtures were to be balanced however, in such a way (see Fig. 1) that the toxic or underneutralized fraction of the toxin antitoxin was similar to that of mixtures containing from 3 to 6 L + doses of toxin per c.c., which had been found to give an active immunity in a large percentage of children. By

TABLE I—COMPARISON BETWEEN DIFFERENT MIXTURES OF TOXIN ANTITOXIN VARYING IN TOXICITY AND NUMBER OF L + DOSES PER C.C.

Mixture	Composition of Toxin Antitoxin Mixture	Action on Guinea Pig		Results in Children				
		Amount Injected	Result	No. Doses	Amount of Each Dose	Total No. Schick Tested	Schick Negative	Per Cent Negative
41	6 L + doses of toxin and 7 units of antitoxin	10 c.c.	Partial paralysis in 16 days recovery	3	10 c.c.	985	570	57.8
		50 c.c.	Paralysis, death in 15 days					
42	5 L + doses of toxin and 5.8 units of antitoxin	0.5 c.c.	Paralysis death in 17 20 days	3	10 c.c.	3,846	3,356	87.2
		10 c.c.	Paralysis death in 17 days					
		50 c.c.	Acute death in 3 days					
43	3 L + doses of toxin and 35 units of antitoxin	10 c.c.	Paralysis in 16 days recovery	3	10 c.c.	142	137	95.9
		30 c.c.	Acute death in 4 days					
		50 c.c.	Acute death in 3 days					

Mixture 53 was the most toxic preparation. For this reason we decided to inject 0.25 to 0.5 c.c. with each dose. The local reactions at the site of injection were quite marked and associated in some of the children with superficial necrosis.

It is interesting to note that by giving three doses of 0.25 c.c., 24 out of 31 children or 77.4 per cent, became successfully immunized. With three doses of 0.5 c.c., 24 out of 28 children, or 85.7 per cent, became immune. 0.25 c.c. of mixture 53 (1/10 L +) corresponds to 1/40 L + or 1 M L D of our toxin, and 0.5 c.c. to 1/20 L + or 2 M L D of toxin. By diminishing the total amount of toxin to 1/40 L + per c.c. we begin to lower the immunizing efficiency of the mixture.

Mixture 56, containing 1/20 L + per c.c. was less toxic than mixture 53. Three doses of this mixture immunized only 97 out of 165 children, or 59.4 per cent.

In estimating the immunity results obtained with mixtures of toxin-antitoxin it is important to remember, as we brought out in a previous communication (1) that the immunity response to the same mixture of toxin-antitoxin may vary greatly in different groups of Schick positive children, depending to a large extent upon the previous repeated exposure of these children to infection with the diphtheria bacillus. Children in the poorer sections of the city, who have been thus exposed and whose tissue cells as a result have already been slightly stimulated, will show a much larger percentage of immunes than those who have not had a similar previous exposure to the Klebs-Loeffler bacillus.

#### IMMUNITY RESULTS WITH DILUTED DIPHTHERIA TOXIN

The results given in Table III indicate that the toxicity or degree of underneutralization of the mixture is the most important factor in determining the value of a preparation of toxin-antitoxin. Owing to the possibility of local necrosis the toxicity of the mixture has to remain within certain limits. A second factor of importance, however, is the total amount of toxin represented by the free and neutralized fractions of the mixture.

We felt that it would be important to determine whether three injections of small amounts of diphtheria toxin would be efficient in producing an active immunity in a large percentage of injected children. Schroeder and Park had reported before the American Association of Pathologists and Bacteriologists (Boston, 1923) that three doses of a freshly diluted toxin immunized 41 per cent of children, while three doses of a dilution of an old, deteriorated toxin, of which 10 c.c. caused paralysis in the guinea pig immunized 70 per cent of children.

Table IV shows that 1/10 M L D of freshly diluted toxin, which is about the maximum amount of toxin that can be injected without causing local necrosis in a positive Schick reactor, only immunized 10 out of 30 children, or 33.3 per cent. 1/10 M L D corresponds approximately to the free or underneutralized fraction of toxin in a toxin-antitoxin mixture which produces immunity in 90-95 per cent of positive Schick reactions. We must assume therefore that the toxin-antitoxin mixture contains not only a certain amount of free toxin, but also free toxoid, which is apparently also effective as an antigenic agent in stimulating the production of antitoxin.

From the results given in Table III it would appear that not less than 1/10 L + of toxin should be present in each cubic centimeter of toxin-antitoxin.

In the institution shown in Table IV, we also injected for purposes of control 35 children with an old type mixture of toxin-antitoxin (3 L + per c.c.). Of these children 34, or 95.0 per cent, became immune.

#### SUMMARY AND CONCLUSIONS

(1) The new mixture of toxin-antitoxin, containing 1/10 L + per c.c. gives excellent immunity results, if it is underneutralized and prepared so as to correspond in its toxicity to a given standard.

(2) This standard of toxicity should be such, that 50 c.c. will cause acute death of a guinea-pig in five to six days, 30 c.c. will cause death in six to ten days and 10 c.c. paralysis in fifteen

IV—COMPARISON OF RESULTS OBTAINED WITH DILUTED DIPHTHERIA TOXIN WITH TOXIN ANTITOXIN AT THE NEW YORK JUVENILE ASYLUM DOBBS FERRY N. Y.

Toxin used for immunization	N 1-1 in each C.C.	No M L D in each C.C.	Amount injected	No doses	Retest months after injections	Results of Schick Retest		
						Total retested	Schick negative	Per cent negative
Diphtheria Toxin		0.1	10 c.c.	3	4.5	30	10	33.3
Toxin Anti 43	3	120	10 c.c.	3	4.5	35	34	95.0

on standing and appeared almost neutralized in the guinea-pig test. The slight excess of free toxin being changed into toxoid, *these favorable immunity results indicate that toxoid can give rise to antitoxin antibodies and that it is probably an important factor in active immunization.* We are giving three injections of diluted diphtheria toxoid at the present time to determine its value in producing an active immunity against diphtheria. A similar method has been suggested by Glenny and Hopkins.

The question arises whether the new type mixtures will remain equally effective after standing for several months and losing most of their toxicity. The answer is important as it would indicate how long such mixtures could be left with safety on the market. We have injected the children in a number of schools with several of these new type mixtures, that have been allowed to remain at ice-box temperature for a number of months. The results of the Schick retests indicate that many of the new type mixtures of toxin-antitoxin are not as effective in their immunizing properties as some of the old type preparations after standing for more than three months.

#### DOSAGE AND METHOD OF ADMINISTRATION

The dose of the new type mixture is 10 c.c., repeated three times at intervals of seven to ten days. The amount is the same for young children as for adults. The injections are preferably intramuscularly, the middle of the outer side of the arm being chosen for this purpose. The injections are given alternately first into one arm, then into the other. By injecting

into the muscle there is less local reaction and we avoid the discoloration of the skin and the induration of the superficial tissues, that are seen sometimes when the more toxic mixtures are injected subcutaneously.

#### IMMUNITY RESULTS WITH THE MIXTURES IN SCHOOLS

Six mixtures of toxin-antitoxin containing 1/10 L + per c.c. and one mixture containing 1/20 L + per c.c. were used in twenty-four schools.

Table III shows the mixtures used, the effect on guinea-pigs of varying doses and the immunity results in children. The dose was 10 c.c. except with mixture 53, which was quite toxic and of which only 0.25 c.c. to 0.5 c.c. was injected with each dose.

It is interesting to note the high percentage of children who became immune with mixtures 69 and 65. The number of retested children is sufficiently large to be representative and thus avoid the error so frequently associated with small numbers in diphtheria immunity work.

From 94.0 to 96.4 per cent of successfully immunized children are excellent results and about as good as we could hope to achieve with the old type mixture of toxin-antitoxin. The results with mixture 67 which was apparently more toxic than the previous two mixtures, are probably not conclusive on account of the small number of retested children. The immunity response to mixtures 52 and 70 which were less toxic than the others was 89 and 87 per cent respectively.

TABLE III—COMPARISON OF RESULTS WITH DIFFERENT MIXTURES OF TOXIN-ANTITOXIN CONTAINING 1/10-1/20 L + PER C C RELATION BETWEEN ACTION ON GUINEA-PIG AND IMMUNIZING EFFICIENCY IN CHILDREN

Mixture	No L+ in each C.C.	No M.L.D. in each C.C.	Action on Guinea Pig		Results in Children				
			Amount injected	Result	No Doses	Amount	Total No Schick Retested	Schick Negative	Per Cent Negative
69	1/10	4	10 c.c.	Partial paralysis, recovery	3	10 c.c.	221	213	96.4
			30 c.c.	Paralysis, death in 25 days					
			50 c.c.	Acute death in 4 days					
65	1/10	4	10 c.c.	Death in 8 days	3	10 c.c.	900	814	94.0
			50 c.c.	Acute death in 6 days					
67	1/10	4	10 c.c.	Paralysis, death in 22 days	3	10 c.c.	61	53	86.9
			30 c.c.	Acute death in 9 days					
			50 c.c.	Acute death in 3 days					
52	1/10	4	20 c.c.	Paralysis in 21 days, recovery	3	10 c.c.	384	342	89.0
			30 c.c.	Paralysis in 17 days, recovery					
			50 c.c.	Paralysis in 17 days, recovery					
70	1/10	4	10 c.c.	Partial paralysis, recovery	3	10 c.c.	55	48	87.4
			30 c.c.	Paralysis, recovery					
			50 c.c.	Paralysis, death in 21 days					
53	1/10	4	10 c.c.	Paralysis, death in 21 days	3	0.5 c.c.	28	24	85.7
			30 c.c.	Acute death in 3-5 days	3	0.25 c.c.	31	24	77.4
			50 c.c.	Acute death in 3-5 days					
56	1/20	2	10 c.c.	No local effect, no paralysis, recovery	3	10 c.c.	165	97	59.4
			30 c.c.	Paralysis in 21 days, death in 35 days					

Mixture 53 was the most toxic preparation. For this reason we decided to inject 0.25 to 0.5 c.c. with each dose. The local reactions at the site of injection were quite marked and associated in some of the children with superficial necrosis.

It is interesting to note that by giving three doses of 0.25 c.c., 24 out of 31 children or 77.4 per cent, became successfully immunized. With three doses of 0.5 c.c., 24 out of 28 children, or 85.7 per cent, became immune. 0.25 c.c. of mixture 53 (1/10 L +) corresponds to 1/40 L + or 1 M L D of our toxin, and 0.5 c.c. to 1/20 L + or 2 M L D of toxin. By diminishing the total amount of toxin to 1/40 L + per c.c. we begin to lower the immunizing efficiency of the mixture.

Mixture 56, containing 1/20 L + per c.c. was less toxic than mixture 53. Three doses of this mixture immunized only 97 out of 165 children, or 59.4 per cent.

In estimating the immunity results obtained with mixtures of toxin antitoxin it is important to remember, as we brought out in a previous communication (1) that the immunity response to the same mixture of toxin antitoxin may vary greatly in different groups of Schick positive children, depending to a large extent upon the previous repeated exposure of these children to infection with the diphtheria bacillus. Children in the poorer sections of the city, who have been thus exposed and whose tissue cells as a result have already been slightly stimulated, will show a much larger percentage of immunes than those who have not had a similar previous exposure to the Klebs-Loeffler bacillus.

#### IMMUNITY RESULTS WITH DILUTED DIPHTHERIA TOXIN

The results given in Table III indicate that the toxicity or degree of underneutralization of the mixture is the most important factor in determining the value of a preparation of toxin antitoxin. Owing to the possibility of local necrosis the toxicity of the mixture has to remain within certain limits. A second factor of importance, however, is the total amount of toxin represented by the free and neutralized fractions of the mixture of toxin antitoxin.

We felt that it would be important to determine whether three injections of small amounts of diphtheria toxin would be efficient in producing an active immunity in a large percentage of injected children. Schroeder and Park had reported before the American Association of Pathologists and Bacteriologists (Boston, 1923) that three doses of a freshly diluted toxin immunized 41 per cent of children, while three doses of a dilution of an old, deteriorated toxin, of which 10 c.c. caused paralysis in the guinea pig, immunized 70 per cent of children.

Table IV shows that 1/10 M L D of freshly diluted toxin, which is about the maximum amount of toxin that can be injected without causing local necrosis in a positive Schick reactor only immunized 10 out of 30 children or 33.3 per cent. 1/10 M L D corresponds approximately to the free or underneutralized fraction of toxin in a toxin-antitoxin mixture which produces immunity in 90-95 per cent of positive Schick reactions. We must assume, therefore, that the toxin antitoxin mixture contains not only a certain amount of free toxin, but also free toxoid, which is apparently also effective as an antigenic agent in stimulating the production of antitoxin.

From the results given in Table III it would appear that not less than 1/10 L + of toxin should be present in each cubic centimeter of toxin antitoxin.

In the institution shown in Table IV, we also injected for purposes of control 35 children with an old type mixture of toxin-antitoxin (3 L + per c.c.). Of these children 34, or 95.0 per cent, became immune.

#### SUMMARY AND CONCLUSIONS

(1) The new mixture of toxin-antitoxin containing 1/10 L + per c.c. gives excellent immunity results, if it is underneutralized and prepared so as to correspond in its toxicity to a standard.

(2) This standard of toxicity shows that 50 c.c. will cause acute death of a guinea pig in five to six days, 30 c.c. will cause death in six to ten days and 10 c.c. will cause death in ten to twelve days.

TABLE IV—COMPARISON OF RESULTS OBTAINED WITH DILUTED DIPHTHERIA TOXIN AND WITH TOXIN-ANTITOXIN AT THE NEW YORK JUVENILE ASYLUM, FERRY, N. Y.

Material used for immunization	No. in each c.c.	No. M L D in each c.c.	Amount injected	No. doses	Refract. month after injection	Immune	Not immune	Total
Diluted Diphtheria Toxin	3	01	10 c.c.	3	25	10	15	25
Mixture Toxin Antitoxin No. 43	3	120	10 c.c.	3	25	24	1	25

to eighteen days and death in eighteen to twenty-five days

(3) The local and constitutional reactions with the new type mixture (1/10 L +) are only slight and compare favorably with those noted with the old type mixtures (3 to 5 L +). The new type mixture can be given even to older children and adults without the fear of causing any marked local disturbance

(4) Three doses of 10 c.c. each are given at intervals of seven to ten days. The intramuscular is preferable to the subcutaneous injection and is usually given in the arm

(5) Freshly diluted toxin in three doses of 1/10 M L D each gave much poorer immunity results than were obtained even with the less toxic mixtures of toxin-antitoxin

(6) There should not be less than 1/10  $\overline{L+}$  of toxin in each c.c. of the new type mixture of toxin-antitoxin

(7) The results show that toxoid can give rise to antitoxic antibodies and that it is probably an important factor in active immunization

#### LITERATURE

(1) Abraham Zingher "Results of Active Immunization with Diphtheria Toxin-Antitoxin in the Public Schools of New York City" (Manhattan and the Bronx). *The Journal A M A*, Vol 78, 1945-1951 (June 24, 1923)

#### Discussion

DR. CHARLES HERRMAN, New York City  
The work which Dr. Park and Dr. Zingher have done in the immunization against diphtheria, illustrates in a striking way what can be accomplished by concentration on one subject. For the past ten years they have been working on this problem. By means of addresses, papers, and circulars of information, they have made the benefits of the method known to physicians and public. Two years ago, I sent letters to the mothers of infants and young children who were under my care, advising immunization. Only 10% responded. A number of those who failed to come then, are coming now, for they have heard more about it. I believe a great deal more has been done in New York City than elsewhere. A short time ago, I had an opportunity of speaking to Prof. Schick. He told me that comparatively little had been done in Vienna, because the people were not fully alive to the dangers of diphtheria. Propaganda, the education of the public, is essential. Other cities will follow the example of New York. During the last few years the number of cases of diphtheria has not been reduced. The mortality is a little lower, but there are still from 800 to 900 deaths a year in this city. Antitoxin has done all that it is possible for it to do. The value of toxin-antitoxin mixtures is beyond question. Dr. Park has shown that in the 90,000 school children immunized there were less than

one-fourth the number of cases of diphtheria than in 90,000 controls not immunized. In order to control diseases which are highly communicable or in which carriers play an important part, it is necessary to immunize all or nearly all infants. Seventy per cent of the deaths from diphtheria occur in children under five years of age, therefore they must be immunized before that time. The private physician under whose care the infant is from birth, is in the best position to advise immunization, just as he advises vaccination. The initial Schick test is unnecessary. I have given it up in private work, this saves time, and simplifies the method. The people are gradually being made aware of the value of preventive treatment, and will be willing to pay for health insurance, just as they do for insurance against accident, fire, and theft. It also pays. If a child contracts diphtheria the expense entailed by treatment for a week or more is certainly greater than that of immunization. The immunization of over 150,000 school children has already shown some results. During the first four months of this year the number of cases of diphtheria in New York City was much less than in the corresponding months of last year, but a marked and permanent reduction in morbidity and mortality will require compulsory immunization. The value of vaccination against smallpox has been proved to anyone who is willing to be convinced. Notwithstanding this there are still communities in which vaccination is not compulsory, and in these, outbreaks of smallpox still occur. We shall always have some conscientious objectors among us. I have had a number of mothers tell me that they did not believe in vaccination, but they had it done, because their child could not be admitted to school without a certificate. The Board of Education has always co-operated with the Department of Health in the immunization against diphtheria, so that it is not unlikely that at some future date, certificates will be required. At first there will be some opposition, but eventually it will become the custom to immunize against diphtheria just as it is now the custom to vaccinate against smallpox.

DR. WILLIAM A. HANNIG, Examiner, Department of Education, New York City. No one can have followed the history of the vast experiment which Dr. Zingher and those associated with him are carrying forward in connection with the prevention of diphtheria among the children of this city without an unusual sense of the convincingness of his results and conclusions. The large scale on which this enormous experiment has been undertaken, the eager readiness with which hundreds of principals, thousands of teachers, and hundreds of thousands of children and their parents have co-operated and submitted to this experiment, and the close approximation of its proven results to the most

sanguine predictions, all these demonstrate that we have here an experiment whose present success and whose even greater future beneficence are unparalleled in the annals of pediatrics.

I run here to express publicly to Dr. Park, Dr. Zingher and Dr. Schroeder, the appreciation and regard of the Superintendent of Schools, Dr. William L. Ettinger, not only in his behalf, but in behalf of the entire teaching and supervisory staff, for the untiring labor, the broad vision and the profound scientific study, which have made this success possible. I venture also to allude to that unspoken volume of gratitude which must fill the hearts of many parents, who when they see the children of less fortunate or less far-sighted relatives, friends, and neighbors succumb to that dwindling scourge, diphtheria, can say with heartfelt content, "At least my children are safe from this suffering, here is a dread that I am spared."

The ready co-operation of the school authorities in this undertaking, the uncomplainingness with which they have broken into their school and class programs and upset their school organizations in order to give to the children the benefit of diphtheria protection, bear eloquent testimony to the extent to which new educational ideas have permeated the rank and file of superintendents, principals, and teachers. Instead of education being, as it is still supposed to be in backward sections and among unenlightened parents, a process of transferring so much information from the inside of books into the inside of brains, education is now recognized by the merest tyro from our training schools as anything that contributes to the individual happiness and social efficiency, present or future, of the boys and girls committed to our care. Any contribution to the conservation and enhancement of child life and child health therefore comes within the scope of education, and the school system, its staff of supervisors, teachers, doctors, and nurses, its buildings and equipment are the fitting agencies for the translation of this contribution into concrete terms.

But in quite another sense has this experiment been educational. Dr. Zingher realizes clearly that big as his undertaking has been it is only the beginning of his work. The greater part is yet to come, namely, the immunization of the large child population of pre-school age, which is so much more susceptible to diphtheria than the population of school age. To reach these children through their parents and to reach them at the earliest possible age, preferably during the second half of their first year, is indeed a herculean task. It would indeed be an impossible task even through the questionable means of legal compulsion, were it not for the fact that the work thus far done in the schools has proved to be a huge educational demonstration,

a vast publicity enterprise, which has paved the way for the extension of the work to younger children.

The school teachers and principals of this city possess to a remarkable degree the confidence of the parents. Only in this way can be explained the willingness of so many thousands of parents to be guided by the advice contained in the Schuck test circulars distributed by the schools and by the personal counsel of teachers and principals, and to submit the little bodies of their loved ones to a treatment which to them is new, doubtful, and possibly dangerous. Only in this way can be explained the ease with which was overcome the prejudice against immunization injections that was developed as a result of the lurid stories brought home by the men who had served in the army.

Then again, the war demonstrated that the schools form the most ready means available for giving publicity to any worthy cause and winning support therefor. The schools through the children reach into nearly every home, and time and time again in the home circle the wisdom coming from the mouth of babes is recognized when it would not be, coming from another source.

Thus, in the first place, Dr. Zingher's work has constituted a tremendous popular demonstration of the efficacy of the new method of combating diphtheria, and, in the second place, it has indicated the further utilization of the school system as one of the expeditionary bases for carrying the good work into the new domain of the children of pre-school age.

For the continuance of both these aspects of the work, I can assure Dr. Zingher and the medical profession generally that Superintendent Ettinger stands ready to pledge the continued co-operation of the public school system, and I convey his cordial wishes that the same success may crown the latter part of this great undertaking that has been thus far so notable.

DR. WILLIAM H. PARK, New York City. The original mixture of 36+ of toxin was used because it had been used in animal experimentation, in animals the protein reaction did not occur. While satisfied with the success we still learned to dread the annoyance of this protein reaction in the older children and so tried reducing the amount of toxin so as to diminish the basillus substance which causes the reaction.

If this toxin and antitoxin are mixed while in cold solutions the amount of toxin antitoxin is 1/10. Mixture will not deteriorate with any rapidity. We believe by immunizing the school child we prevent the children contracting diphtheria and so taking it home to the younger mem-

bers of the families. With a proper toxin-antitoxin mixture there should be neither a local toxin nor protein reaction.

DR I. H. GOLDBERGER, New York City. Any one unacquainted with the many difficulties—sometimes insurmountable—that confront us in administering new public health measures in New York City, can hardly conceive or appreciate the vast amount of work done by Doctor Zingher in placing the Schick test on a firm basis, and in standardizing the toxin-antitoxin treatment.

The medical profession is grateful to Doctor Park and Doctor Zingher for their endeavor to make this test and treatment safe, accurate, and reliable.

Doctor Zingher has been an indefatigable worker in popularizing the Schick test, and much credit is due him. As an illustration of his enthusiasm in this work, I can recall an occasion in the pioneer days of the Schick test when he came to an institution in this city, of which I am a member, and asked the house physician for permission to Schick-test three children. The three children were selected for Doctor Zingher, and at the end of an hour when the house physician returned to see if he could be of further assistance, he met Doctor Zingher coming down the stairs. Upon reaching the ward, our house physician discovered that not only had Doctor Zingher Schick-tested the three children, but that all the children in that ward and two adjoining wards had been tested also. I do not know whether or not Doctor Zingher has returned to that institution recently, but I do know that he would have had difficulty in gaining readmission after his first visit.

The man to whom we should also be deeply grateful, and to whom much of the success of the Schick testing in the schools is due, is Doctor William L. Ettinger, Superintendent of Schools of the City of New York, who back in 1921 saw the benefits that would accrue if the children of the New York City schools were to receive the Schick test and toxin-antitoxin.

It is exactly three years ago that I invited Doctor Park to come into the schools of this City and continue his work there. The convincing manner in which Doctor Park presented his conclusions of the preliminary work of the Schick tests, at a clinical conference meeting at

the Willard Parker hospital in April, 1920, prompted me to introduce this work into our public schools. At that time we started with 3,000 children in 33 schools. What has taken place in the interim is now history.

It is my opinion that if we are to make further progress in protecting children against diphtheria, it will be necessary to pass legislative measures requiring children to present certificates of immunization against diphtheria, in the same manner that certificates of vaccination are required of children who seek admission to our public schools. An act of this kind would soon influence parents to have their children immunized at an age when they are accustomed to have them vaccinated.

DR ZINGHER, in closing.

I wish to seize this opportunity to acknowledge the valuable assistance given us in our work by the personnel of the Department of Education, without whose help the Schick work could not possibly have been very successful in the schools. The Schick work in the schools will soon reach a point where it will be taken up as a routine measure for all incoming children of the Kindergarten 1-A classes. This work could probably be done by each medical inspector in his own schools. We must remember, however, one important fact in our diphtheria prevention efforts. The work in the schools is only a *preliminary* part in educating the parents and showing them that the Schick test and toxin-antitoxin immunization are harmless. The greater and in fact the most important field remains to be covered. I am referring to the immunization of children of pre-school age, in which group I am including all children between one and six years of age. The co-operation of the general practitioners is absolutely essential here, as the work would be too widely scattered to be undertaken by the Department of Health. *In this group the preliminary Schick test could be omitted with advantage*, the three injections of toxin-antitoxin being given by the private physicians as a routine to all young children in their practice. The final Schick test should not be omitted, however. It could be done by the private physicians, or by the school physician when the children are admitted to school. The main efforts of the Health Officer should be directed towards educating the parents to the value and necessity of having their young children protected against diphtheria.

## HISTAMIN IN THE DIAGNOSIS AND TREATMENT OF INTESTINAL INTOXICATIONS

By CLARENCE W. LIEB, A.M., M.D.  
NEW YORK CITY

THE role of histamin in producing systemic pathology is giving us new and valuable hints toward the correction of that much misunderstood condition which we term intestinal intoxication.

Histamin (Imumazolyethylamin) is an amine from the amino acid histidin whose toxic property was first brought out in literature by Barger and Dale (1). Mellanby and Twort (2) isolated a Gram negative organism capable of converting histidin into histamin. About the same time Berthelot and Bertrand (3) isolated an organism that had the power of decarboxylating histidin into histamin. Abel and Kuba (4) on experiment with guinea pigs have shown that this amine is toxic in strength 1/300 part of a grain and when injected intravenously with guinea pig produces death in from three to five minutes. Koessler and Hanke (5) reached the following conclusion in re *B. coli* and production of histamin:

"This apparently simple chemical process the decarboxylation of amino acids to exceedingly potent substances of amine structure, is of great theoretical and practical interest. The relation of this problem to the general nutrition of bacteria, to the metabolism of amino-acids in the mammalian organism, to the pathology and pharmacology of the smooth muscle fiber system, and to the chemical constitution of the products of the glands of internal secretions, mark it as a fundamental inquiry of biology."

Inchley (6) has shown that the constriction of venules is an important result of the action of histamin leading to capillary engorgement and consequent edema. He has further shown that histamin shock after a lethal toxic dose in the cat can be prevented by preliminary treatment with nitrites to dilate the veins.

Kellaway and Cowell (7) show that "when a normal cat is injected intravenously with a dose of 0.1 or 0.05 mg. histamin in 0.01% solution (in saline) there follows transient wide dilation of the pupils, inhibition of the heart, sweating of the pads, salivation and congestion of the mucous membranes. There is never dyspnea, nor is the circulatory failure so marked as to cause even the transient collapse of the animal. But when a similar injection is made into a cat suffering from adrenal insufficiency, the animal walks a few steps and after about thirty seconds falls over on its side with severe inhibition of the heart, pronounced dyspnea and sometimes with Cheyne-Stokes respirations. This collapse is sometimes attended with general convulsions, the

pupils are widely dilated and the animal looks as if it is about to die, but in about ten minutes it walks away apparently recovered. The symptoms produced by small doses of histamin in hypersensitive animals are usually profoundly modified by previous subcutaneous injections of adrenalin. Excess of adrenalin in the circulating blood antagonizes the histamin and prevents collapse probably by raising the blood pressure to such a level as to make collapse impossible."

Manwaring, Monaco, and Marino (8) believe that the anaphylactic shock in dogs is due partly to the sudden liberation of hepatic products, having histamin-like effects on the extra-hepatic blood vessels. Studying the effects of histamin in various isolated canine tissues they found that a histamin shock reaction in intact delapathized, and eviscerated dogs was followed by a sudden pronounced fall in arterial blood pressure. From their lists the authors conclude that the dominant reacting tissues in histamin shock is fairly evenly distributed throughout the body. The most striking reaction in blood free perfusions of isolated canine tissues is the explosive edema of all organs tested. The authors think that the increased perfusion resistance is largely due to increased tissue pressure from edema.

Evans (9) thinks that the etiology of arteriosclerosis and interstitial nephritis are largely the result of bacterial toxins in the circulation.

Ebbecke (10) has shown that wheals in urticaria and general shock correspond completely to one another. They do not simply represent a tissue injury as a result of introduced or endogenous toxin, but also signify a defense reaction to the extent that wherever products of catabolism with such an action occur in the tissue in unusual concentrations, these substances which are not very stable can be rendered harmless by dilution. But if they are distributed over too large areas, the reaction may become dangerous to life.

Carnot, Koskowski and Libert (11) used subcutaneous injections of 1.25 to 1.75 mg. of histamin in fourteen cases. Tabulated results show that from thirty three to fifty-five minutes after injections, and lasting for one to two hours the amount of gastric juice total and combined acidity and digestive power, estimated by the method of Mett, were decidedly, and at times greatly increased. The subcutaneous injection was promptly followed by more or less marked reddening of the face sometimes by headache and slight palpitation of the heart. The objective symptoms included reddening of the abdominal surface, the chest, the upper and lower ex-

tremities, and moderate increase in the rapidity of the heart beat

Pringle (12) states that the nature of the toxin causing death in intestinal obstruction has not been definitely settled. It is, however, generally accepted that it belongs to one of the groups of poisonous chemical substances produced by the disintegration of protein, *e g*, proteoses, amines, neurins, and cholins. The probability, however, seems to be that a whole series of the end-products of protein are present in the obstructed intestine, and are active in producing death.

Eppinger and Guttman (13) have shown that histamin, and Sollman and Pilcher (14) that other amines, when applied to the skin will cause an urticarial wheal, while Sieberg (15) has observed generalized urticaria after injections of histamin subcutaneously.

Longcope (16) states that "it seems highly probable, from all the evidence that can be collected, that proteoses or the toxic amines, such as histamin, may be absorbed from the intestine and cause disturbances not only of nitrogenous metabolism, but also, temporarily, of renal functions, but without anatomic lesions in the kidneys that can be demonstrated by our present methods." He (17) also showed that the effects of intravenous injection of histamin produced the same effects as the intravenous injection of 0.1 gm peptone per 100 gm body weight, namely, an immediate collapse of the animals with slow and difficult respirations. About ten minutes later the response became rapid while the paralysis and spasmodic convulsive movements continued.

Meakins and Harrington (18) found histamin in minute concentration in the cecum of four cases (cecostomy specimens) and in the transverse colon of two cases (colostomy specimens), all these patients having some type of intestinal pathology or symptoms. They failed to find histamin in fecal specimens of two other cases studied, one being a gastro-intestinal invalid and the other a case of chronic nephritis without intestinal symptoms.

They conclude that the formation of histamin is not dependent upon the existence of intestinal obstruction, since it occurs several weeks after the obstruction has been removed. They could not detect histamin in the feces whether there was intestinal obstruction or not, and state that this is probably due to the oxidation of this substance during the passage through the large intestine.

The fact that histamin is not usually found in rectal specimens but in cecal specimens and is only formed in the presence of acid, may explain their negative findings in stools.

From the foregoing it is obvious, that, experimentally, histamin plays an important rôle in the production of pathologic states. It is, therefore,

logical to conclude that the elimination of histamin and its cause would result in clinical cures.

Out of 320 stools examined during the past two years, 278 showed high histamin reactions. Most of the stools examined were from patients showing some form of chronic physical disability. 30% of the stools in which histamin was found showed red blood coloring matter in conspicuous amounts. 92% of these stools showed large amounts of mucous (after straining the stools through gauze).

Colon bacilli in minimal numbers was characteristic of these histamin stools.

Forty stools examined for indol and tryptophan showed positive indol in 24 stools and tryptophan in 18.

Koessler and Hanke (19) have shown that when *B. coli* are allowed to metabolize the amino-acid histidin, either alone or in the presence of nitrates or ammonium salts, the toxic amine histamin is not formed. They also showed that histamin is only formed in a highly acid environment, this acid being formic, and with an available source of carbon such as glycerol or glucose.

Parkes, Jollyman, Karczoy and Schiff (20) have shown that formic acid is rapidly decomposed by colon bacilli with the formation of sodium formate as the result. This in turn aided by bacterial action yields sodium carbonate with consequent faintly alkaline stool. It is only likely that the highly acid media of the cecum inhibits *B. coli* growth and thereby removes an important obstacle in the formation of histamin.

The following extracts from Hiss and Zinsser (21) are illuminating.

"Extensive investigations have been carried out to determine whether or not the constant presence of this microorganism (*B. coli*) in the intestinal tract is an indication of its possessing a definite physiological function of advantage to its host. Although insufficient work has been done upon this important question, and no definite statement can be made, it is more than likely that the function of the bacillus coli in the intestine is not inconsiderable if only because of its possible antagonism to certain putrefactive bacteria, a fact which has been demonstrated in interesting studies by Bienstock and others."

Herter (22) states that "While it is not unlikely, that under conditions of an excessive carbohydrate diet, colon bacilli may aggravate morbid processes by a voluminous formation of gas, they do not, of themselves, take part in actual putrefactive processes. It is likely, therefore, that in most of the intestinal diseases formerly attributed purely to bacilli of the colon group, these microorganisms play but a secondary part."

Langdon Brown (23) contends that *B. coli* by splitting indol from tryptophan activates the

glands of intestinal secretion Harries (24) has recently pointed to the fact that exophthalmic goitre is due to the excessive absorption of tryptophan from the intestine which in turn is traceable to the absence of the indol producers in the intestine.

The newer bacteriologic investigations as to the elaboration of toxic split products in the intestine leads to the conclusion that intestinal auto-intoxication is not a new bacteriological infection but a matter of bacterial activation with toxin formation.

Neuberg (25) has shown that nearly all reducing substances play the role of activators in the formation of yeast.

Von Wasserman and Picker (26) examined the effect of activating bodies on the production of toxic substances by intestinal bacteria. They found that in some instances the addition of activators increased the toxicity by 30 to 40% and that the filtrate is much more toxic than the complete culture. The authors assume that similar processes are at the back of intestinal intoxication.

Oxalic acid production in the colon has been demonstrated to be a bacterial process quantitatively determined by activators in the form of sugars reaching the lower bowel (Lieb) (27).

This newer knowledge as to toxæmia produced by activation rather than bacterial reinfection changes our entire conception of intestinal toxæmia. The problem resolves itself into a matter of keeping the contra-indicated sugars out of the diet, or at least from reaching the lower bowel. A high residue diet, by mechanically carrying sugars to the colon, hyperperistalsis by hastening the intestinal contents from stomach to colon, and hyperacidity, which inhibits starch digestion are factors which must be dealt with in the correction of intestinal toxæmia.

The writer has adhered to the following therapeutic regimen in dehistaminizing patients:

1 Gastro-intestinal rest. This is accomplished with a low residue diet, peristaltic inhibition by means of atropin or beozol benzoate, and gastro-intestinal alkalization with the following powder:

Calci Carbonatis }	ss
Calci Lactatis }	ss
Magnesi oxid, pond	gr X
Osmo-kaolin	ss

Sig. One powder, t.i.d.a.c. in one glass water

2 Colonic lavage, with a half of one percent monohydrated sodium carbonate to kill Gram negative organisms (28), these being the chief bacterial offenders in the colon, and a 2% kaolin suspension which has the property of making histamin inert (barium sulphate likewise having this property) rendering bacterial toxins harmless and changing the bacteria from a proteolytic

to an aciduric type (Braafladt) (29). Particular care must be taken to drain and alkalinize the cecum. The alkalization of the cecum may have an important bearing on the activation of the d'Herelle phenomenon.

3 *Bacillus coli* implantation with suspensions of known strains of high indol-producing *B. coli* in a dextrin solution implanted in the colon until thorough colonization is established.

Up to the present time 318 patients have been treated by these methods. Each patient, besides having a special stool examination one or more times, and a careful physical and clinical survey including Roentgenological gastro intestinal studies where the diagnosis was in doubt. Of the patients treated, 242 showed complete relief from the symptoms and signs disclosed by physical inventory before treatment, 56 found only partial relief, 20 showed practically no improvement.

# CASE HISTORIES

Case 1—A R S, male, age 48, business man

**Symptoms.** Asthenia, insomnia, headaches, constipation and gastric distension for one year. Patient gives a history of conjunctival hemorrhages at almost weekly intervals for a period of several years.

**Positive Findings.** Well developed but with tendency to obesity. Skin muddy, conjunctival hemorrhage involving entire right eye. B P 95/60. Fecal masses felt over colonic flexures and marked gastric distension. Total acidity of 95. Internal hemorrhoids. Proctoscopic examination showed hemachromatosis and dilated venules in the lower sigmoid region. Stool examination showed much mucus, red blood coloring matter, extra high histamin and high acidity. Few *B. coli*. After the first week of treatment patient's symptom showed improvement, and after three weeks from the beginning of treatment he felt like a new man. His whole appearance and attitude changed. His blood pressure went up to 125/80. Hemorrhoids disappeared and bowels became regular. For two years now he has had no conjunctival hemorrhages and the bowels have been perfectly regular. Patient has had a histamin check up every six months but a positive histamin was found only on one occasion since first seen. *B. coli* implantations have been prophylactically given once yearly.

Case 2—G A E., male, age 43, author

**Symptoms.** Constipation for twenty years, mental sluggishness for one year, irritability, lack of application, chronic eczema.

**History.** Dysentery in Philippines '99. Tropic liver and spleen, 1906. Three months jaundice, acute intestinal intoxication three years ago.

**Positive Findings** X-ray examination hyperactive stomach, normal gall bladder, sigmoid and rectal stasis, 72 hours, appendix retention. Overweight, head and thorax negative. Liver easily palpitated, spleen negative. Three-inch panniculus. Blood pressure 105/80. Constant tympany over cecum. Proctoscopic examination showed marked injection of mucosa with edematous patches just above Houston's valves. Skin three patches of eczema the size of the palm of the hand on the extremities. Blood and urine chemically normal. Gastric hyperacidity. Feces showed extra heavy histamin reactions, a highly acid stool, negative indol, and minimal number of *B. coli*.

After course of dietetic, colonic, and *B. coli* implantation treatment, the patient had complete relief from all mental symptoms and has taken a cathartic but once since treatment in early spring. His eczema practically disappeared after treatment, but at no time has it been entirely absent. Patient states that he has never felt so well in his life, and that his literary output has never been of such good quality and quantity.

Case 3—B J W, male, aged 68, banker

**Symptoms** Attacks of vertigo for 15 years which were getting more severe and frequent, "nervous indigestion," deafness in left ear, for five years. Bowels perfectly regular. One year ago patient had complete physical inventory made by one of the leading internists of the country who gave him a good physical rating for his years and attributed the vertigo to a chronic catarrhal otitis media. Three well known Aurists verified the aural findings and advised local treatment to middle ears.

**Positive Findings** Healthy appearing man. Special senses, excepting ears, negative. Almost total deafness in left ear. Blood pressure 185/95. Excrusted, indurated, and indolent skin eruption on right shoulder size of "greenback," which he had for ten years.

**Laboratory Findings** Blood nitrogen, blood sugar, carbon dioxide, combining power, normal. Urine—highly acid, sp. gr. 1026, trace of albumen, no casts. Feces, highly acid, high histamin and oxalic acid, much mucus.

After the intensive course of detoxication treatment patient's vertigo left and has not returned since April, 1923. His blood pressure hovers around 155/90. Feces and urine chemistry are normal, all epigastric symptoms have gone, and the skin lesion on the shoulder has entirely disappeared. There has been a very noticeable improvement in hearing. The interesting thing, but not at all unusual, about this case is that the intestinal toxæmia existed in the presence of perfect bowel functioning. Some

of the most intestinally toxic patients seen have had no symptoms referable to the gastro-intestinal tract.

Case 4—C E F, female, age 25

**Chief Complaint** Chronic headaches of typical migraine type, occurring at bi-weekly intervals. Patient states that both her father and grandmother were sufferers from the same type of headaches. Physical examination entirely negative. Laboratory examination normal, excepting for high fecal histamin.

Since taking intestinal treatments for two weeks, as outlined above, the patient has had only two minor attacks in the past year.

Case 5—M L, female, age 28

**Diagnosis** Chronic colitis and metrorrhagia. This patient had a typical chronic colitis of five years' duration, but had been constipated as long as she could remember. She had followed the orthodox drug treatment for the condition. In the past few months her constipation has been alternating with diarrhea.

Patient was of the typical gastro-intestinal invalid type. The most noticeable objective sign in her case was a marked hyperæmia involving her neck, chest, and shoulders, and a strikingly embossed dermatographia. X-ray studies showed no pathology with the exception of hyperstalsis and spasticity. Feces showed high histamin, quantities of mucus, and high acidity.

This patient made slow response to the treatment, but her condition improved steadily. After two months from the beginning of treatment her colitis symptoms had entirely disappeared, her skin condition became normal, and she gained over ten pounds in weight. She has had no menstrual difficulty since her intestinal toxæmia has been corrected. (A few drops of the filtrate from this stool induced menstruation in a female monkey in five hours). There is excellent evidence to indicate that histamin plays an important rôle in menstrual disorders, particularly dysmenorrhea and metrorrhagia.

Case 6—A W A, female, age 48

**Diagnosis** Epilepsy and urticaria. Duration 12 years. Attacks typically grand mal and of almost weekly occurrence. Physical examination elicited nothing noteworthy. Her health was perfect, and minor ills had disappeared since her menopause five years previously. Urticarial wheals appeared on her abdomen and thighs coincident with epileptic attacks. Basal metabolism within normal limits. Blood and urine chemistry normal. Feces showed a practically 100 percent gram negative flora, very acid, many undigested meat fibers, and a particularly high histamin.

This patient has had neither epileptic attacks nor urticaria since undergoing the dehistaminiz-

ing treatment two years ago, and in spite of continuous nervous strain due to financial loss and a parietic husband, she is in perfect health

### CONCLUSION

1 The toxicity of histamin has been definitely established

2 The elaboration of histamin in the colon is of frequent occurrence and is often associated with organic and functional pathologic states

3 The eradication of histamin by dietetic chemical, and B coli implantations frequently results in clinical cures

4 Increased histamin production in the colon with resulting systemic disturbances is one of activation by sugars, not a new bacteriological invasion

My grateful thanks are due J J Connellan for having interested me in the subject of histamin production in the colon and for his valuable suggestions in the preparation of this paper

## IS HEROIN A NECESSARY DRUG?

By S DANA HUBBARD, M.D., Department of Health  
NEW YORK CITY

**S**HOULD the manufacture of heroin be interdicted?

It is our opinion that interdiction is indicated owing to the promiscuous and improper use of this drug by the addict and the rather infrequent use of this drug in general medical practice.

The Narcotic Clinic operated to study first-hand drug addiction by the Department of Health of New York City demonstrated that of 7,464 narcotic drug addicts over 90 per cent of them were addicted to the use of heroin.

In 69 per cent of the total clinic applicants, the drug habit had been acquired through evil associates. The vast proportion of these were all under thirty years of age

The A M A—House of Delegates—ex-

pressed the opinion of physicians throughout the United States, as follows

"That heroin be eliminated from all medical preparations

"That heroin should not be administered, prescribed or dispensed by physicians

"That the importation, manufacture and sale of heroin should be prohibited in the United States"

This resolution is now three years old and there has not been a single protesting resolution from any associated doctor or medical organization. It, therefore, must be the conclusion of the profession regarding this action

The recent report of Special Deputy Police Commissioner of New York City regarding three

years' experience in scrutinizing the "dope" evil is also corroborating, at least statistically

Of 9,637 persons arrested in the three past years 6,892 were addicted to heroin or cocaine, singly or combined

The average age of the addicts in 1921 was 25 years, while in 1923 it ranged between 27 and 28 years

This official, also a physician, also reports that only 2 per cent of those arrested can trace their addiction to medical treatment. The major causes were found to be "curiosity, morbidity, and criminal association"

Hence we may conclude that 98 per cent of nearly 10,000 drug addicts acquire their vice through curiosity, morbidity and criminal association and that 71 per cent of the total were users of heroin

#### *Public Service and Hospital Use Interdicted*

In the United States Army, the use of heroin has been interdicted by order of the Surgeon General

In the United States Navy, the use of heroin has been interdicted by order of the Surgeon General

In the United States Public Health Service, the use of heroin has been interdicted by order of the Surgeon General

The Health Commissioners of Chicago and New York City simultaneously expressed themselves, "Stop the use of heroin in all hospitals. It serves no purpose that other agents cannot accomplish as effectively, and without the attendant possibility of disaster"

Of 236 hospitals, institutions and sanatoria, more than 50 per cent have requested their medical staff to comply with the request of the Health Commissioner regarding heroin

Professor E G Janeway—Bellevue Hospital, 1892—advised his house staff against the use of heroin, particularly stating that heroin used in pneumonia was invariably followed by a fatal result

Professor Alfred Loomis—New York University, Professor of Medicine—taught his students to "beware of so insidious and baneful a drug which more often was a menace than a help"

Professor Thompson—New York University, Professor of Materia Medica—taught that "it was a dangerous and unnecessary drug"

Professor A A Smith—Bellevue, Professor of Materia Medica—informed his class of students that heroin was uncertain and not dependable and was more often a danger than a help

Professor James—Professor, Columbia University—informed the writer some years ago

that he had never had occasion to use the drug and was inclined to think it was superfluous and that being used as it was by addicts it was a menace

Professor Lambert—Bellevue Hospital, an expert of over a quarter of a century on habituation—is opposed to the therapeutic use of heroin

#### *The Grave Danger of Heroin*

The appalling feature of drug addiction is that heroin makes addicts quickly, that its victims are mere children in years and experience, that through insufflation, ingestion, or subcutaneous injection its effect is well-nigh instantaneous

The physiological effect of heroin is to benumb the inhibitors and make of moral cowards brutal, brainless men without fear and without conscience

Professor Lambert expresses the effect by stating that it "inflates the personality and exaggerates the ego"

There can be but one, or should be but one, answer to the question—*Heroin should be totally and absolutely abolished by all nations*

It will always be necessary to fight the use of opium and its derivatives in drug habituation, but this war will be made easier by the absolute annihilation of this baneful and useless drug

Heroin is the drug used by addicts of over 95 per cent of New York's underworld (criminal classes), according to the statistics of the police and prison statistics. And the unfortunate part of the situation is that less than 1 per cent of these miserable creatures acquire the habit through illnesses

Heroin is not a necessity in either medicine or art. All of its useful qualities can be easily and safely replaced by other alkaloids of opium

It is earnestly hoped that everyone will become interested in this effort to awaken the public—here and abroad—to the necessity of preventing the manufacture of heroin. This in the interests of social welfare and economic safety from criminal imposition

The *only way* to successfully fight this peril is through legislation, forbidding its manufacture; and by international agreement, with *all* nations participating, not only to forbid the manufacture, but to prevent importation from or exportation to any land

The heroin question is not a medical one, as heroin addicts spring from sin and crime. It is a social problem where the medical and pharmaceutical and allied professions can do much to aid in solving this serious problem

Society in general must protect itself from the influences of evil, and there is no greater peril than that of *heroin*

## HONESTY IN MEDICAL PROPAGANDA

The fundamental basis of the practice of medicine is honesty

The fundamental basis of the friendly association of one doctor with another is honesty

The fundamental basis of the appeal of doctors to the public for a higher standard of medical practice is honesty

Diagnostic ability cannot take the place of honesty

Skillful fingers cannot take the place of honesty

Glowing arguments cannot take the place of honesty

There may be varying degrees of knowledge and skill among doctors, but there is only one standard of honesty

Every person, even the most ignorant, knows what honesty is.

An honest man is sure of his facts, and is ready to defend his words with his actions. He is kind, and realizes that dishonest words and arguments "come home to roost" to plague him who puts them forth

The fundamental basis of the campaign for

better medical laws is honesty—honesty of one doctor with another, of the doctor with his patients, and of the medical leader with the public.

Doctors are very human, and it is not strange that they may sometimes doubt one another's motives and disagree publicly. If ninety-five per cent of the doctors of New York State are white and five per cent are streaked with black the whole profession appears to the public to be at least a little grayish. If one medical politician makes absurd or impossible claims, a cloud is cast on all medical leaders.

What is the object of these seeming platitudes? The few medical leaders who are setting the pace in the legislative workshop must have the honest, whole-souled support of the ten thousand physicians who will have the dominating influence with the members of the Legislature. Already the leaders have diagnosed threatening difficulties which have arisen largely because of suspicion—that mental twist which looks for a tinge of dishonesty in another's motives. We will call attention to some of the molehills which

may become impassable mountains of opposition unless they are honestly faced.

- 1 Ascribing improper motives to the leaders
  - 2 Doubting the word of the leaders (and also the editors' promises)
  - 3 Acting without considering all sides of a question (Something for county societies to think about)
  - 4 Quoting inaccurately in history as well as figures
  - 5 Letting George do it
  - 6 Staying out of the game on account of dislike of a leader
  - 7 The biggest difficulty of all—failing to practice the adopted standard of medical ethics in honesty to patients and to one another.
- Now is the time for every physician to be honest with himself and with his fellow-practition-

ers, to keep an open mind that is receptive to information and argument, and to speak forth on behalf of a high standard of medical practice

The columns of the NEW YORK STATE JOURNAL of MEDICINE will be open for all arguments, in fact the editors fear they will not receive word of the arguments that are put forth in opposition to those of the leaders. The editors promise recognition and an honest deal to all comers. The only thing that will be excluded is abuse—unless it can be put in the department of Prunes where it properly belongs, for abuse is always funny to those whom it does not hit.

The next quarter year will be one of tremendous opportunity for establishing a new standard of medical practice in New York State, and the physicians will meet it conscientiously and honestly

F O

### DEVELOP COUNTY SOCIETY ACTIVITIES

In our Medical Directory, of 1923, we have resumed publication of "The Alphabetical List of Physicians of the State of New York"

This list covers seventy-five pages and carries names of registered physicians, followed by their locations in towns, cities, or boroughs. Many of these physicians are not members of any medical society, and, inferentially, have few fraternal contacts. In most cases this is due to indifference, or personal diffidence, and also due to lack of interest among organization physicians who could measurably help this situation by just a little activity in their immediate neighborhoods. A very large number of physicians are content to sit back and complain of the invasions of their natural provinces by irregulars and fakirs, when just a little active cultivation of the field would produce a harvest of co-operative strength of real local influence.

County societies are always in a receptive attitude toward applicants, but seldom, even through specially appointed committees, are warmly and actively working to acquire them. The New York County organization is having remarkable success in recruiting, and the Bronx is determined to overtake Erie as rapidly as possible. Recent events have made it highly desirable, and important, for every practitioner in the State to be honorably enrolled, and every county society should make an earnest drive that would at least canvass every physician in the county.

As is usually the case, the protection of the public from injury by ignorant, unscrupulous, and criminal practitioners, is charged upon the medical profession, which is in turn accused of selfishness when protective legislation is asked for.

The Department of Education desires a com-

plete alphabetical list of all persons holding themselves out to practice healing arts, and the regular profession is expected to pay for it.

While it seems to us entirely up to the State, by the exercise of its police powers, to take care of law breakers, and of all offenders against the health of our citizens, and that the honest practitioners of medicine, dentistry, and law, or of any other legitimate art, are entitled to protection without a special tax levy upon them, we have no doubt that, generally, medical practitioners will be willing to add another fee to the list of impositions, providing any good to the people of the State results from it.

We believe that physicians will be willing to submit to a state-wide registration, if it will clean out the crooks who are practicing medicine under false credentials, but we also believe that the only way to prevent the people from supporting irregulars and fakirs who are now, every day, violating the law by practicing healing arts without licenses of any sort, will be through intensive general education. To this end we need to enlist the support of the lay press, for we gain little encouragement from such publicity as is given to Coué, or from the example of a great newspaper like the New York Times in publishing a column and more of obituary of Abrams, a proven impostor, immediately followed by a five-inch long obituary of one of the greatest pediatricians of our time, Dr. L. Emmett Holt.

If there can be inaugurated in 1924

- 1 Public health education in every county
- 2 Development of local hospital service in every county
- 3 Post graduate medical courses in every county

4 A drive for new members by every county society

5 Co-operation between physicians for better financial conditions affecting physicians

6 Material care of aged and unfortunate physicians by every county society, with or without insurance features.

7 A classified census, in every county, of every sort of medical practitioner for the purposes of complete identification.

If these activities can be carried on they will, in our opinion, be worth every dollar, and every ounce of effort spent upon them

N B V N

## THE MEDICAL PRACTICE ACT

The members of the Medical Society of the State of New York are deeply interested in the amendments proposed by the State Department of Education, which might be included under the title "Proposed amendments relative to the practice of medicine"

Your Committee on Legislation hoped to be able to print in this issue of the JOURNAL the full text of the proposed bill, but the Counsel for the State Society is making some changes in the text and therefore the bill cannot be published now, but as soon as it is in shape, we will publish it, first, to the County Legislative Chairmen, and then in the JOURNAL.

Some of the County Medical Societies have heard this bill read, have made comments and suggestions thereon, and in accordance with the bulletin sent to the County Legislative Chairmen on December 20th, 1923 have passed resolutions "for" or "against" the bill, and have so notified the Chairman of the Committee on Legislation of your State Society as a matter of record

At the time of going to press, the following County Medical Societies are on record, as,

*In favor of the proposed bill* Albany, Cayuga, Dutchess-Putnam, Greene, Jefferson, Montgomery, Oneida, Ontario, Richmond, Rockland, Schoharie, Schuyler, Seneca, Sullivan, Suffolk, Tompkins, Warren Westchester and Yates County Medical Societies

*In opposition to proposed bill* Broome Schenectady, Kings, Orange, Rensselaer, and Ulster County Medical Societies

*No vote taken but general attitude is favorable* Essex, Franklin, and Washington County Medical Societies

*No vote taken but general attitude is unfavorable* Oneida, and Nassau County Medical Societies

Clinton County Medical Society is reported as about evenly divided

"Genesee County Medical Society is radically opposed to the proposed bill and requests the enactment of a law under the approbation of the State Department of Education, State Department of Health, and State Legislative Committee which shall specify and standardize the requirements for the issuance of a license to practice medicine and surgery in the State of New York"

A day letter was sent to each County Medical Society Secretary on Saturday, January 19th, 1924, asking that he forward immediately to the Legislative Bureau the attitude of his County Medical Society, and it will be greatly appreciated if those County Societies who have not already taken action on the bill, will do so immediately, and forward their objections or suggestions for change, by wire or special delivery to the Chairman of your State Legislative Committee.

J N V V

## THE WEEKLY JOURNAL

This issue of the New York State Journal of Medicine is the first of a series which will be issued weekly on Fridays. It is unavoidably incomplete and unbalanced for we are printing 26 pages of proposed medical laws and lists of members of legislative committees. The principal law of all, the Medical Practice Act, is not yet ready for introduction, but we hope to print it in full in a week or two. While routine legislative matter dominates this week's issue, it will serve as a foundation leading up to interesting discussions on medical economies and legal medicine.

We expect to begin a series of arguments for and against the proposed Medical Practice Act. A number of doctors have called us up and asked us questions regarding the bill. We have asked

the inquirers to put their questions in writing, for we wish to know what doctors say about the bill and to hear all the arguments on both sides

We will continue to publish scientific articles but our supply will become exhausted before the next annual meeting of the State Society. We solicit contributions, especially papers which are brief and practical

We also ask for live news of the local medical societies, especially the county societies. We are subscribing to a clipping bureau and we note an abundance of medical items which should be reported in the State Journal. Send us these items and help to make the Journal newsy and interesting

# LEGAL

## CHIROPRACTORS PRACTICE MEDICINE

In last month's issue when we stated that chiropractors practice medicine we sustained our claim by citing a case in the Appellate courts and stated there were numerous cases in the lower courts of conviction of chiropractors on the charge of unlawfully practicing medicine. We have a few cases of interest to sustain in this statement.

In November, 1920, a chiropractor, who now maintains an office in one of the leading hotels in the city, treated an eight year old child who was suffering from pericarditis and pleuritis over a period of ten days. While under the treatment of the chiropractor the child died. The chiropractor in his own handwriting made out a death certificate which he delivered to the undertaker. The certificate was, of course, refused by the board of health and the case turned over to the medical examiner's office. The child had been previously treated in a hospital in the city and upon the recommendation of the chiropractor the parents removed the child from the hospital and undertook his chiropractic treatment. The parents were advised by the hospital doctors that the removal of the child under the circumstances would cause its death. Such was the faith of the parents in the representations made by the chiropractor that they took this risk. During the course of the treatment the chiropractor took the child off the careful diet that she had been under in the hospital and gave her apples to eat. The child died within ten days after the chiropractor started his treatment. This man was fined upon conviction in the sum of \$250

or thirty days in prison. He paid the fine and doubtless has made the fine many times over in his subsequent practice and today he is one of the men who under the form of bills sponsored by chiropractors would be one of the first to receive a license without examination and be rewarded for his previous conviction by being officially and legally designated a doctor of chiropractic.

In May, 1921, a chiropractor having an office in this city, who engaged during the daytime as a clerk in the baggage room of one of the local railroad depots, was found guilty of practicing medicine without a license and fined \$50. We have not yet been informed whether he continues to smash baggage by day and spines by night.

A lady in whose behalf prominent people interceded was practicing chiropractic in an exclusive neighborhood near the Waldorf-Astoria and maintained a half-page advertisement in the classified telephone directory. In January, 1921, she pleaded guilty to the charge of practicing medicine without a license and was fined \$50.

In commenting on the deterrent influence of this fine, it might be observed that this lady is still engaged in practicing chiropractic and has evidently found the occupation remunerative.

We likewise have the records of other chiropractors now practicing who apparently enjoy the distinction of a conviction under the Medical Practice Act and will probably be some of the representative chiropractors that will appear before the legislative committees to urge the passage of the chiropractic grab. G W W

## SEVERANCE OF ULNA NERVE WITH RESULTANT PARALYSIS

The plaintiff, a colored woman, while presumably exchanging fistic pleasantries with a relative, put her arm through a window pane, causing a deep laceration of the forearm. She called the defendant, a general practitioner, to attend her. Upon his arrival he found that she had bled profusely and that some large arteries had been severed. She was suffering from shock, her pulse was soft, weak and rapid, mucous membranes and skin anæmic, with extremities cold and her forehead damp with perspiration. The defendant after checking the hemorrhage probed the wound to determine if any fragments of glass were present and with aseptic precautions brought the lips of the wound together with strips of adhesive plaster and ap-

plied a dressing. Because of the extreme exsanguination and shock to the patient she was put to bed, covered warmly, and given light nourishment and stimulants. The wound healed promptly by primary union.

Upon the first day after the operation, defendant observed symptoms of paralysis of the hand and advised the plaintiff that the laceration had caused a severance of a nerve and that she would need an operation, which should be done at a hospital, and advised her to go to the hospital for this operation and have the same done by a surgeon. The plaintiff objected to going to the hospital and desired to be treated in a private institution. The defendant gave the plaintiff a note addressed to a well known sur-

geon and advised her to see the surgeon at once. That was the last that the defendant saw of the plaintiff until they met in court about two years later.

It appears that the plaintiff had not gone to the surgeon as advised and that she was suffering from a complete paralysis of the hand, wrist and fingers and her hand was utterly useless and

atrophied. After a two-day trial this issue was submitted to the jury to determine if the defendant was responsible for this bad result. The plaintiff had denied in the course of the trial that the defendant had given her the instructions to seek surgical aid for the severed nerve. The jury determined the issues in favor of the defendant and dismissed the plaintiff's complaint.

G W W

### BURN ON FACE FROM ADMINISTRATION OF ETHER ANAESTHESIA

The plaintiff in this matter, a young woman, at the time of the occurrence complained of, was about nineteen years of age and an appendectomy was performed upon her at one of the hospitals. The defendant administered the anaesthesia to the plaintiff at the time of the operation. He is a man of wide experience in this particular branch of medicine. It was claimed that in the administration of the anaesthesia the defendant permitted the anaesthetic to come into contact with the face of the plaintiff thereby causing her to be severely and seriously burned. The plaintiff testified that she entered the hospital for the performance of the operation and that an anaesthesia was administered to her, that after she had awakened from the effects of the anaesthesia, her face was extensively swollen.

During the course of the trial it was testified by the plaintiff that the defendant on the third day after the operation came to her room at the hospital where there was also present another physician who had assisted at the operation, and that the defendant stated to her that he was sorry he had burned her face, but that it was not entirely his fault as it would not have happened had the other physician, then present in the plaintiff's room, not been talking to him, the defendant, in the operating room. The extent of the injuries of the plaintiff was substantiated and exaggerated by the testimony of the mother. At the time of the trial there was upon the side of the plaintiff's nose a keloid which was perceptible only upon close inspection. A little face powder, such as is occasionally used by young women would have completely hidden the keloid. The plaintiff called the defendant as her own witness to give an explanation of the occurrence of the injury claimed to have been sustained by the plaintiff. The testimony of the defendant as to his explanation of the occurrence was that he had administered the anaesthesia to the plaintiff in the identical manner in which he had done in a great number of other instances and with the same apparatus, that it is not customary to make any examination of the epidermis to discover whether a patient is idiosyncratic or not and that it is customary to make an examination of the vital organs only to ascertain whether the administration of the anaesthesia would be dele-

terious to the life of the patient, that this examination was made by the defendant and the patient found to be a healthy subject, there was nothing in her appearance to justify any suspicion. The plaintiff having called the defendant as her own witness was bound by the statements of the defendant and could not introduce testimony to contradict the same. At the close of the plaintiff's case a motion was made to dismiss the complaint for the failure of the plaintiff to make out a cause of action and the trial court, who had given the matter careful and considerate attention, granted the motion dismissing the complaint and on the question of the explanation of the occurrence, the court said:

"There was only one theory, and that was a mere theory, and that was that the plaintiff was, as they called it, an idiosyncratic, out of the usual, unusual. There is no evidence of negligence in that statement. You have got an explanation, such as it is, of what has happened. It is the best, apparently, the witnesses produced by the plaintiff can give. No law requires a man to account for the happening of a thing if it may not be accounted for. The presumption of negligence arises only because the thing is unusual, upon the theory that it can be accounted for. But if what is done in the particular instance is done with due regularity, the accustomed course followed the apparatus used identical, with no fault either in machinery or method, and an untoward result arises, how can negligence be charged?"

On the question of the duty of a physician to explain the happening of an untoward result to an unconscious or helpless patient, the court said:

"That when an unconscious and helpless patient receives some injury or suffers some untoward result which is unusual from the hands of a physician, the duty is cast upon the physician to explain it, because the very fact of its unusualness argues that something must have happened which caused the injury, which would not have happened in the ordinary course, and as the plaintiff is unable to offer any explanation, the law expects him to speak who, under the circumstances, it is fair to suppose knows."

G W W

# LEGISLATION

For the purpose of reference, the attention of the physicians of the State is called to the following lists of the Standing Committees of Senate and Assembly for the year 1924

As frequent reference will be made from week to week relative to comments on various bills as

introduced, and as requests will be made of the County Legislative Chairmen and of the individual members of the State Society, through these columns, to address letters or communications "for" or "against" legislation as pending,

You are requested and advised to preserve these lists carefully for future reference

# LEGISLATIVE BILLS

The following bills affecting the practice of medicine have been introduced in the Legislature

## SENATE

A bill introduced in the Senate by Senator Michael E. Reiburn of New York, known as Senate Print No. 63 (concurrent Assembly Print No. 43, by Assemblyman Wm S. Hart of Richmond County) which would change Section 21 of the Workmen's Compensation Law by introducing a new sub-Section 2, which would read that "an accidental injury if proven, arose out of and in course of employment," the rest of the Section to read the same.

The bill has been referred to the Labor and Industry Committee in each House.

*Comment* None

A bill introduced in the Senate by Senator Thomas I. Sheridan of New York, known as Senate Print No. 68 (concurrent Assembly Print No. 48, by Assemblyman Paul T. Kammerer, Jr., of New York), would authorize the industrial board to permit claim for compensation to be filed within two years after accident or death therefrom.

The bill has been referred to the Labor and Industry Committee in each House.

*Comment* This digest is inserted for the purpose of impressing upon physicians the necessity of preserving their case histories and notes of procedure in hearings, for a period of at least two years. No further comment will be made unless there is some change in the bill. (This is the same as Senate Int. No. 593, of 1923.)

A bill introduced by Senator Robert C. Lacey

of Erie County, known as Senate Print No. 76 and which has been referred to the Senate Judiciary Committee, would repeal Chapter 488 of the Laws of 1913, which incorporated the Rockefeller Foundation.

*Comment* If any member of the Society has any questions which he wishes to send to the Committee on Legislation relative to this measure, we will be glad to answer them to the best of our ability.

A bill introduced by Senator William L. Love of Brooklyn known as Senate Print No. 127 (concurrent Assembly Print No. 267, by Assemblyman Simon B. Van Wagenen of Ulster County), would amend Section 12 of the County Law by permitting supervisors, except in a county constituting a general health district, to employ such public health nurses as they may deem proper.

Special note Senate Print No. 127, referred to Senate Internal Affairs Committee. Assembly Print No. 267, referred to Assembly Public Health Committee.

*Comment* Your Committee on Legislation has not as yet seen the text of the bill, and therefore can make no comment upon it.

A bill introduced by Senator William L. Love of Brooklyn, known as Senate Print No. 128 (concurrent Assembly Print No. 232, by Assemblyman Lattin), would amend Sections 19, 19 a, 19 b, Public Health Law, by extending provision for State aid in public health work to

counties "having a population of 50,000 or upwards" It limits any public health work by such county by placing the limits in the hands of the State Commissioner of Health, as to applications now pending or hereafter made, and appropriations would be limited under the direction of the State Commissioner of Health, and "any funds granted as State aid to any county and unexpended at the end of the year for which such grant was made, shall be returned at the end of such year, to the State treasurer"

The bill has been referred to the Public Health Committee in each House

*Comment* This bill would change State aid given to a county other than one having within its boundaries a city "of the first or second class," as the old bill reads, and excludes a county now having a city with a population of 50,000 or upwards and removes, in a measure, the control and direction of the funds appropriated by the county from the board of supervisors, placing the direction of expenditure under the direct control of the State Commissioner of Health

A bill introduced by Senator Michael E Reiburn of New York City, known as Senate Print No 140, referred to Senate Labor and Industry Committee, would amend Section 13 of the Workmen's Compensation Law, by striking out the paragraph which now limits to 20 days the furnishing of a report to the employer after the first treatment, and from the text of the bill, would give an unlimited time for the furnishing of such a report

*Comment* This bill would remove, in a measure, the criticism laid upon physicians and would give them an unlimited period of time in which to report injuries to the employer and to the Industrial Commission

A bill introduced by Senator Michael E Reiburn of New York City, known as Senate Print No 141, referred to Senate Labor and Industry Committee, would amend Section 15, Workmen's Compensation Law, by providing compensation for loss of one eye shall be for 192 weeks, instead of for 128 weeks, as the present law reads

*Comment* No comment

A bill introduced by Senator Michael E Reiburn of New York City, known as Senate Print No 142, would amend Section 25, of the Workmen's Compensation Law, making the first payment of compensation due on the 14th day of disability instead of on the 21st day, as the law now reads, reducing the time of dispute as to workmen's right to compensation on the part of the employer or insurance carrier from the 25th day to the 18th day after disability, or from the 15th day down to the 8th day, as the new bill would read, after the employer first has knowledge of the accident, and making it mandatory upon the commissioner to notify the injured

workman or his dependents, the employer and the insurance carrier to appear at a hearing before the industrial board or a referee where such compensation is controverted or has been stopped

This bill has been referred to Senate Labor and Industry Commission

*Comment* Your Committee on Legislation has no comment to make on this

A bill introduced by Senator Michael E Reiburn of New York City, known as Senate Print No 175 (concurrent Assembly Print No 195, by Assemblyman Julius S Berg of Bronx County), would amend Section 345, Public Health Law, by placing fiscal control of the State Institute for the Study of Malignant Disease, now located at Buffalo, N Y, under the State Department of Health The board of trustees of the institute are to be limited in some of their acts to approval by the State Commissioner of Health, and any unexpended balance of the institute would be transferred to the State Department of Health and made available for and expended by this department in carrying out the objects and purposes for which such appropriations were made

The bill has been referred to the Public Health Committee in each House

*Comment* This digest is inserted and attention called to the bill pending the receipt of any communication "for" or "against" the bill

The members of the Medical Society of the State of New York may obtain further information relative to the bill from their individual representatives in the Legislature

A bill introduced by Senator Michael E Reiburn of New York City, known as Senate Print No 176 (concurrent Assembly Print No 234, by Assemblyman James Male of New York City), is an amendment to the Public Health Law, adding new Section 19-a, which would continue the hospital for the care of crippled and deformed children, located at West Haverstraw, N Y, under the present board of trustees, but further would place the entire hospital under the general supervision and control of the State Commissioner of Health, in that he may prescribe that any and all of the powers and duties of such board be exercised and performed in a manner to be approved by him, expenditures and disbursements are to be authorized, audited and approved by the State Commissioner of Health, and all present and future moneys in the way of appropriations, gifts, legacies, bequests and other donations are placed under the State Commissioner of Health

This bill has been referred to the Public Health Committee in each House

N B In future summaries of legislation, Senate Bills will be referred to as S B and their printed numbers will always be given, Assembly Bills will be referred to as A B

ASSEMBLY

A bill introduced in the Assembly, by Mr Ansley B Borkowski of Erie County known as Assembly Print No 10, which is an amendment to Sections 3, 12, 15 and 19 of the Workmen's Compensation Law, and provides compensation for occupational diseases, reduces the waiting period from 14 to 7 days, makes the minimum compensation for disability \$10 per week, strikes out maximum limit of \$3,500 for temporary total disability, and inserts a portion of a paragraph relative to loss of hearing and of vision and relating to examinations by physicians

The bill has been referred to the Assembly Labor and Industry Committee.

*This for the Attention of Oculists and Aurists*

Sec. 19 has been amended to read as follows (the amended portion being underscored.)

Sec. 19 Physical examination An injured employee claiming or entitled to compensation shall submit to such physical examination as the commissioner of the board may require. The place or places shall be reasonably convenient for him. Such physician or physicians as the employee or carrier may select and pay for may participate in an examination if the employee or carrier so requests. Proceedings shall be suspended and no compensation be payable for any period during which he may refuse to submit to examination (New portion begins here.) At a hearing to determine the length of disability the extent of injury or loss of a member or the percentage of loss of vision the industrial board referee or deputy commissioner may select the physician or physicians to determine the length of disability, the percentage of loss of vision or of a member and the reasonable cost of such examination shall be a proper charge against the employer or insurance company for which an award shall be made and payable as for compensation

*Comment* Your Committee on Legislation will welcome communications from those who have dealt with the Compensation Commission relative to such matters, as to whether the State Society should be "for" or "against" the amendment.

Mr Louis Cuvillier of New York has introduced a bill in the Assembly, known as Assembly Print No 19, which would add a new section, known as Section 20, Article 1, of the State Constitution, providing that whenever any amendment to the United States Constitution is submitted to the Legislature for ratification, provision shall be made for submitting the proposal to the voters

The bill has been referred to the Assembly Judiciary Committee.

*Comment* As voters of the State of New York, and especially as physicians who have experienced troubles with the Eighteenth Amendment, it would seem that we as a body should favor such an amendment as we quite naturally are interested in desiring outlet of expression, rather than to have any recurrence in a constitutional amendment such as we have experienced with the Eighteenth Amendment.

Further comment will not be made on this measure

A bill introduced by Assemblyman Louis Cuvillier of New York City, known as Assembly Print No 20, would petition Congress to call a National Constitutional Convention to repeal Article 18 prohibition article of the Constitution

The bill has been referred to Assembly Judiciary Committee.

*Comment* As citizens of the State, we are interested either "for" or "against" such a measure, and this notice is given for the information of the doctors throughout the State.

Further comment will not be made.

Assembly Print No 43, by Assemblyman William S Hart of Richmond County (concurrent Senate Print No 63)

See digest and comment under Senate Print No 63

Assembly Print No 68, by Assemblyman Paul T Kammerer, Jr, of New York (concurrent Senate Print No 68)

See digest and comment under Senate Print No 68.

Assembly Print No 54, by Assemblyman Samuel Mandelbaum of New York City, adds new Section 692, Education Law, requiring education boards in first class cities to provide food for pupils in all schools, who may need same

Referred to Assembly Education Committee. (Same as A Int. 1117, Pr 1175, of 1923)

*Comment* No comment.

Assembly Bill Print No 65, by Assemblyman Joseph Reich of Kings County, would add a new subdivision 10-a, Section 360, Tax Law, by permitting deduction from income for tax purposes, of all expenses paid during the year for medical, surgical or dental services. This bill has been referred to the Taxation and Retrenchment Committee.

*Comment* This bill interests physicians in that they must be more accurate in the preservation of their accounts, as they undoubtedly will be called upon by patients at the end of the year to furnish duplicate statements of moneys paid them by said patients.

## SPECIAL NOTICE

(This is the "Medical Inspection in Schools" bill of previous years)

Assembly Bill Print No 66, by Assemblyman Joseph Reich of Kings County, would amend Sections 570, 571, of the Education Law, by providing that boards of education and trustees shall appoint physicians and den-

tists and may employ nurses for service in schools. The bill, which has been referred to the Assembly Education Committee, is printed here in full, with new matter in italics

STATE OF NEW YORK

No 66

Int 66

IN ASSEMBLY,

January 7, 1924

Introduced by Mr Reich—read once and referred to the Committee on Public Education

AN ACT\*

To amend the educational law, in relation to medical services in the schools of the state.

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Sections five hundred and seventy and five hundred and seventy-one of chapter twenty-one of the laws of nineteen hundred and nine, entitled "An act relating to education, constituting chapter sixteen of the consolidated laws," as such chapter was amended by chapter one hundred and forty of the laws of nineteen hundred and ten, and as such sections were added by chapter six hundred and twenty-seven of the laws of nineteen hundred and thirteen, section five hundred and seventy-one having been amended by chapter one hundred and eighty-two of the laws of nineteen hundred and sixteen, are hereby amended to read respectively as follows

§ 570 Medical [inspection] *services* to be provided Medical [inspection] *services* shall be provided for all pupils attending the public schools in this state, except in cities of the first class as provided in this article. Medical [inspection] *services* shall include the services of [a trained registered nurse, if one is employed, and shall also include such services as may be rendered as provided herein in examining pupils for the existence of disease or physical defects and in testing the eyes and ears of such pupils] *physicians, surgeons and dentists for the purpose of ascertaining the existence of disease or physical defects, of advising, directing or providing for the correction and prevention of such disease or defects and of providing treatment for the same. The services of trained registered nurses shall be rendered in aid of such services*

§ 571 Employment of medical inspectors The board of education in each city and union free school district, and the trustee or board of trustees of a common school district, [em-

ploy, at a compensation to be agreed upon by the parties, a competent physician as a medical inspector to make inspections of pupils attending the public schools in the city or district,] *appoint at such salary as such board of education, trustee or board of trustees shall determine, such physicians, surgeons, dentists and nurses as may be required to carry out the provisions of this article. One of the physicians so appointed shall be known as the medical inspector of such city or district.* If appointed by a board of education of a city such physician, surgeon, dentist or nurse shall reside within the city. The physicians, surgeons and dentists so employed shall be legally qualified to practice as such [medicine] in this state, and shall have so practiced for a period of at least two years immediately prior to such employment. [Any such board of trustees may employ one or more school nurses, who] *Nurses so employed* shall be registered trained nurses and authorized to practice as such. Such nurses when so employed shall aid the medical inspector of the district and shall perform such duties for the benefit of the public schools as may be prescribed by such inspector.

[A medical inspector or school nurse] *Such physician, surgeons, dentists or nurses* may be employed by the trustees or boards of education of two or more school districts, and the compensation *thereof* [of such inspector], and the expenses incurred [in making inspections of pupils] as provided herein, shall be borne jointly by such districts, and be apportioned among them according to the assessed valuation of the taxable property therein.

[In cities and union free school districts having more than five thousand inhabitants, the board of education may employ such additional medical inspectors as may be necessary to properly inspect the pupils in the school in such cities and union free school districts.]

[The trustees of a common school district or the board of education of a union free school district whose boundaries are coterminous with the boundaries of an incorporated village shall, in the employment of medical inspectors, employ the health officer of the town in which such common school district is located or the health officer of such union free school district, so far as may be advantageous to the interests of such district.]

§ 2 This act shall take effect immediately

\* EXPLANATION—Mr. Reich's bill is old law to be omitted. [ ] is new.

*Comment* Physicians can have no objection to the employment by the educational authorities of physicians, dentists, nurses, etc., for the inspection of school children, *providing* those who do this inspection do not carry their enthusiasm to the extent of advising children, parents or guardians to send the children to certain physicians, dentists, clinics, or the like, thus instigating a proceeding of close corporation in the matter of treatment.

Attention is called to the last part of Section 570, where it states in the matter to be added to the bill

"physicians, surgeons and dentists for the purpose of ascertaining the existence of disease or physical defects, of *advising directing, or providing* for the correction and prevention of such disease or defects and of *providing treatment for the same*'

The bill is obnoxious in that it contains the same phraseology and has the same purport as the similar bill of last year which was introduced and finally died in committee and last year was opposed by the medical inspector of schools of the State Department of Education.

*Individual members of the State Society county legislative chairmen, and others are urged to write their individual Senators and Assemblymen to oppose the bill, when it contains as it does now clauses which permit of directing treatment at the hands of inspecting physicians or otherwise*

This bill must be followed carefully and defeated unless we may bring about changes eliminating the directing of who shall give the treatment.

(The above bill is the same as Sen Int 383 Print 385 of 1923)

Assembly Print No 195, by Assemblyman Julius S Berg of Bronx County (concurrent Senate Print No 175)

See concurrent Senate Print No 175 for digest and comment.

Assembly Print No 196, by Assemblyman Julius S Berg of Bronx County, adds new article 2 a, Labor Law, for establishing a bureau of old age pensions and appropriates \$2,000,000. Referred to Assembly Ways and Means Committee.

*Comment* None at present.

(Same as A Int 100, Pr 100 of 1923)

Assembly Print No 228, by Assemblyman Henry O Kahan of New York City, amends Section 306, Public Health Law, by authorizing regents to revoke certificate to practice optometry held by person guilty of unprofessional conduct or misrepresentation in practice or advertising.

Referred to Assembly Public Health Committee.

*Comment* Will be made when text of bill is seen

Assembly Print No 229, by Assemblyman Henry O Kahan of New York, amends Section 307, Public Health Law, by increasing penalty for violation of provisions regulating practice of optometry. Referred to Assembly Public Health Committee.

*Comment* Will be made when text of bill is seen

Assembly Print No 232, by Assemblyman Frank H Lattin of Orleans County (concurrent Senate Print No 128)

Referred to Assembly Public Health Committee.

See digest and comment under concurrent Senate Print No 128

Assembly Print No 234, by Assemblyman James Male of New York County (concurrent Senate Print No 176)

Referred to Assembly Public Health Committee.

See digest and comment under concurrent Senate Print No 176

Assembly Print No 267, by Assemblyman Simon B Van Wagenen of Ulster County (concurrent Senate Print No 127)

Referred to Assembly Public Health Committee.

See digest and comment under concurrent Senate Print No 127

Assembly Print No 277, by Assemblyman John H Conroy, of New York City, amends sections 12, 20, Workmen's Compensation Law by reducing non-compensated waiting period after accident from 14 to 7 days, where disability is of more than 28 days, compensation shall run from date of disability.

Referred to Assembly Judiciary Committee

*Comment* Will be made when text of bill is seen

Assembly Print No 309, by Assemblyman Joseph Reich of Brooklyn, which would add new section 213, Labor Law, requiring employers to furnish nursing and first aid service in factories, mercantile and other establishments.

Referred to Assembly Labor and Industry Committee.

The bill is printed here in full

STATE OF NEW YORK

No 309

Int 309

IN ASSEMBLY,

January 16, 1924

Introduced by Mr Reich—read once and referred to the  
Committee on Labor and Industries

## AN ACT\*

To amend the labor law, in relation to furnishing nursing and first aid service in factories and in mercantile and other establishments

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Article seven of chapter fifty of the laws of nineteen hundred and twenty-one, entitled "An act in relation to labor, constituting chapter thirty-one of the consolidated laws," is hereby amended by inserting therein a new section to follow section two hundred and twelve, to be section two hundred and thirteen, to read as follows

§ 213 Nursing and first aid service In addition to the specific requirements prescribed by any provision of this chapter or of the industrial code in relation to the safety and sanitation of factories, mercantile establishments, mines, quarries, tunnels and other places, it shall be the duty of every employer to furnish in any such factory, mercantile establishment, mine, quarry, tunnel or other place in which twenty-five or more persons are employed, nursing and first aid service under medical supervision for such length of time daily as may be prescribed by rule of the board All nurses so furnished shall be registered nurses who have demonstrated their qualifications in industrial nursing to the satisfaction of the board of health of the city or town where they are employed As part of such service medicines, dressings, bandages and implements sufficient to render first aid in cases of injury shall be supplied The board shall adopt rules and regulations to carry into effect the provisions of this section

§ 2 This act shall take effect immediately

*Comment* The same comment is offered on this bill as was offered on the like bill last year, namely, that the bill is impractical as it burdens the populace directly and indirectly with a large tax The medical profession is antagonistic in that its individual members could not enter into contracts to be present for certain fixed hours at the numerous manufacturing and other establishments which the law would require

There are not enough registered nurses in the State nor could they be furnished before a number of years to be present even part of a day in

\* EXPLANATION—Matter in italics is new, matter in brackets [ ] is old law to be omitted

more than a small percentage of the employments specified, to say nothing of physicians being tied up for a certain number of hours each day in compulsory attendance, according to their contract with the employers, by the terms of this bill

Emergencies in health and accident cases in such establishments are now adequately provided for throughout the State within a reasonably short time

County Chairmen and others interested should write to the Labor and Industry Committee of the Assembly to which the bill has been referred, and object to the amendment

(The above bill is the same as A Int No 343 of 1923 )

Assembly Print No 342, by Assemblyman Morris Weinfeld of New York City, adds new article 22, and amends section 4-b, Public Health Law, providing for control, possession, prescribing and dealing in the distribution of habit-forming drugs

Referred to Assembly Public Health Committee

The bill is printed here in full

STATE OF NEW YORK

No 342

Int 342

IN ASSEMBLY,

January 16, 1924

Introduced by Mr Weinfeld—read once and referred to the Committee on Health

## AN ACT

To amend the public health law, in relation to habit forming drugs, to provide for the control, possession, sale, prescribing, dispensing and dealing in the distribution of such drugs

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," is hereby amended by inserting therein a new article, to be article twenty-two thereof, to read as follows

## Article XXII

## HABIT FORMING DRUGS

- |             |                                    |

§ 420 Short title This article shall be known as the narcotic drug control law

§ 421 Definitions As used in this article

1 "Person" includes any corporation, as sociation, copartnership or one or more individuals

2 "Physician" means a licensed practitioner of medicine as defined by article eight of this chapter

3 "Apothecary" means a licensed pharmacist or druggist as defined by article eleven of this chapter

4 "Dentist" means a licensed practitioner of dentistry as defined by article nine of this chapter

5 "Veterinarian" means a licensed practitioner of veterinary medicine as defined by article ten of this chapter

6 "Medicine" means a drug or preparation of drugs in suitable form for use as a remedial or curative substance

7 "Sale" includes barter, exchange or giving away or offering therefor and each such transaction made by any person whether as principal, proprietor, agent, servant or employee.

8 "Dispense" includes distribute, leave with give away, dispose of, and deliver to a person or to his agent to be delivered to him

9 "Administer" means only administration by a person authorized to administer habit forming drugs

10 "Coca leaves" includes coca leaves, cocaine,

or any compound, manufacture, salt, derivative or preparation thereof, including alpha or beta eucaine or any of their salts or any synthetic compound of any of them, but shall not include decocanized coca leaves or preparations made therefrom or other preparations of coca leaves which do not contain cocaine.

11 "Opium" includes opium, morphine, codeine, diacetyl morphine (heroin), or any compound, manufacture, salt, derivative or preparation of any of them, except apomorphine and its salts

12 "Cannabis indica" or "cannabis sativa" shall include any compound, manufacture, salt, derivative or preparation thereof and any synthetic substitute therefor

13 "Habit forming drugs" shall mean coca leaves, opium, cannabis indica or cannabis sativa.

14 "Manufacturer" means a person who by compounding, mixing, or other process of manufacture, produces or prepares habit forming drugs for sale on written orders and does not include an apothecary who compounds habit forming drugs to be sold or dispensed on prescription

15 "Wholesaler" means a person who supplies habit forming drugs on written orders

16 "The Harrison Act" means the act of congress, entitled "An act to provide for the registration of, with collectors of internal revenue, and to impose a special tax upon all persons who produce, import, manufacture, compound, deal in dispense sell, distribute, or give away opium or coca leaves, their salts, derivatives or preparations and for other purposes," approved December seventeenth, nineteen hundred and fourteen, as amended

17 "Department" means the department of state police unless the context show that another department is meant

18 "Commission" means the state hospital commission unless the context show that another commission is meant.

§ 422 Acts dangerous to public health Any unauthorized possession, control over, sale, distribution, prescribing, administering or dispensing of habit forming drugs is hereby declared to be dangerous to the public health and a menace to the public welfare

§ 423 Acts prohibited It shall be unlawful for any person to possess, have under his control, sell, distribute, administer, dispense, or prescribe any habit forming drug except as provided in this article.

§ 424 Sale on written orders 1 By whom and to whom sold A manufacturer, wholesaler, or apothecary may sell or distribute habit forming drugs only to any of the following persons and upon his written order

a To a manufacturer, wholesaler or apothecary

b To a physician, dentist or veterinarian

c To a public or private hospital

d To a hospital or institution licensed for the treatment of drug addiction

e To a person in charge of a laboratory where habit forming drugs are used for scientific or medical research, but only for use in such laboratory

f To a person in the employ of the United States or of this state or of any political subdivision thereof purchasing or receiving the drug by reason of his official duties

g To a captain or proper officer of a ship, upon which no regular physician is employed, for the actual medical needs of the officers and crew when not in port

Provided, however, that both parties to the transaction in each of the above cases are registered under the Harrison Act if required by such act to be so registered

## 2 Order blanks

a A written order for the supply of any habit forming drug shall be signed in duplicate by the person giving it or by his duly authorized agent, one duplicate of which shall be presented to the person who sells or distributes such habit forming drug and in the event of his acceptance of such order, each party shall preserve his duplicate of such order for a period of two years in such a way as to be readily accessible for inspection and it shall be subject to inspection by any public officer or employee engaged in the enforcement of this article. Provided, however, that it shall be deemed a compliance with this sub-section if the person giving the order shall have complied with the provisions of the Harrison Act respecting the requirements governing order blanks under said act

b Every person who shall give a written order, as herein provided, to another person for any habit forming drug, shall, at or before the time of giving such order, make or cause to be made a copy thereof on a form substantially similar to the written order required above, to be issued in blank for that purpose by the department of state police, and to be procured from the department upon application, which application shall state the date and number of the federal registration of the applicant if required to be so registered

c Such triplicate copy shall accompany the original written order furnished to the person supplying the drug who shall, if he accepts the order, sign it and the triplicate and forthwith on the filing of such order mail the triplicate to the department

3 Possession lawful Possession of or control over habit forming drugs, obtained as provided in this section, shall be lawful if in the regular course of business, occupation, profession, em-

ployment, or duty of the possessor and in an amount necessary therefor.

§ 425 Preparations and remedies exempted The provisions of this article shall not apply to preparations or remedies which do not contain more than two grains of opium, or more than one-fourth of a grain of morphine, or more than one-eighth of a grain of heroin or more than one grain of codeine, or any salt or derivative of any of them in one fluid ounce, or, if a solid or semi-solid preparation, in one avoirdupois ounce or to liniments, ointments, or other preparations which are prepared for external use only, except liniments, ointments, and other preparations which contain cocaine or any of its salts or alpha or beta eucaine or any of their salts or any synthetic substitute for them, provided that such remedies and preparations are sold, distributed, dispensed, or possessed as medicines and not for the purpose of evading the intentions and provisions of this article

## § 426 Professional use of habit forming drugs

1 Veterinarians A veterinarian may prescribe, administer or dispense habit forming drugs in good faith and in the course of his professional practice only, and not for use by a human being

2 Dentists A dentist, in good faith and in the course of his professional practice only, may administer or dispense habit forming drugs to patients under his immediate treatment

3 Physicians A physician, in good faith and in the course of his professional practice only, may prescribe, administer, or dispense habit forming drugs

§ 427 Prescriptions Any apothecary may sell or dispense habit forming drugs to any individual upon a written prescription of a physician, or veterinarian, dated and signed on the day when issued and bearing the full name and address of the patient and the name, address and registry number of the practitioner under the Harrison Act if he is required by it to be so registered. The person filling the prescription must write the date of filling and his own signature upon the face of the prescription, and the prescription must be retained on file by the apothecary filling it for two years so as to be readily accessible for inspection and it shall be subject to inspection by any public officer or employee engaged in the enforcement of this article. The prescription shall not be refilled

§ 428 Record to be kept 1 Physicians, dentists, veterinarians Every physician, dentist and veterinarian shall keep a record of all habit forming drugs administered or dispensed by him, showing the gross amount administered or dispensed, and shall every year make a return to the department of state police, on blanks furnished by it upon application showing the amount of habit forming drugs on hand at the beginning

of the period, the amount received during the period, and the amount at the end of the period.

2. Manufacturers, wholesalers, apothecaries Every manufacturer wholesaler and apothecary shall keep a record in a form prescribed by the department, showing the amount of habit forming drugs shipped or received in the course of interstate or foreign commerce and shall once in each year, at a time designated by the department, send a copy of the record to the department. The record shall also contain a statement of the total amount of habit forming drugs on hand at the beginning and close of the period and in the case of an apothecary, the amount of habit forming drugs used in compounding exempted preparations or remedies

3 Exempted preparations and remedies Every manufacturer of exempted preparations or remedies shall keep a record of the amount of habit forming drugs received and exempted preparations or remedies manufactured and every dealer therein shall keep a record of all sales of exempted preparations and remedies, in such form as the department shall prescribe, and shall once in each year send to the commission a copy of such record and every such manufacturer shall include therewith a report of the amount of habit forming drugs at the close of such year

4 Form and preservation Every such record shall be kept for a period of two years from the date of the transaction recorded, and a record required by or under the Harrison Act containing substantially the same information, shall be a compliance with this section All records required by this section shall be readily accessible for inspection and shall be open to inspection by the proper authorities

§ 429 Labels Whenever an apothecary pursuant to a written prescription shall sell or dispense habit forming drugs or whenever a physician, dentist or veterinarian shall dispense any of such drugs, he shall securely affix to the container of such drug a label stating in legible English the name and address of the physician or veterinarian prescribing or dispensing and of the apothecary or dentist dispensing the date and the name and address of person for whom or the owner of the animal for which the drug is dispensed The label shall also specify the name and quantity of the drug sold or dispensed and contained in the container

§ 430 Authorized possession of drugs by individual A person to whom or for whose use any habit forming drug has been sold or dispensed by an apothecary, physician or dentist or the owner of an animal for which any such drug has been prescribed or dispensed by a veterinarian may lawfully possess it in the container delivered to him by the person selling or dispensing same

§ 431 Physical examination required A phy-

sician, dentist or veterinarian shall not administer, dispense or prescribe any habit forming drug except after a physical examination of the person for whom or the animal for which the drug is intended.

§ 432 Exemption from restrictions 1 Common carriers, employees, public officers The provisions of this article restricting the possessing or having under control of habit forming drugs shall not apply to common carriers or warehousemen or their employees engaged in lawful transportation or storage of such drugs, nor to public officers or employees while engaged in the performance of their official duties nor to temporary incidental possession by employees or agent of persons lawfully entitled to possession, or by persons whose possession is for the purpose of aiding public officers in the performance of their official duties

2 Interstate commerce This article shall not apply to acts done, or to habit forming drugs possessed in the course of interstate or foreign commerce.

§ 433 Drugs delivered to the department All drugs which have been seized and judicially determined to have been unlawfully possessed or the title to which has ceased and which have come into the hands of a peace officer shall, upon the direction of a court or magistrate, be delivered to the state hospital commission. The commission may receive drugs surrendered to it subject to the rights of any person lawfully entitled thereto, and all drugs in final possession of the commission may be disposed of under its direction The commission shall keep a record of the receipt and disposition thereof

§ 434 Notice of conviction of professional man sent to licensing board 1 On conviction of any physician, dentist, veterinarian or apothecary for wilful violation of any of the provisions of this article, a copy of the sentence and of the opinion of the court or magistrate, if any be filed, shall be sent by the clerk of the court, or by the magistrate to the board or officer having power to suspend or revoke the license or registration of the person convicted, for such action as the board or officer deems proper

2 At the request of such board or officer, the clerk or magistrate shall send to such board or officer a transcript of the record or of the proceedings in a court not of record, and such portion of the evidence as may be requested

§ 435 Reports of treatment. 1 Physicians A physician who undertakes the treatment of the habit of taking or using any habit forming drug shall, before undertaking the treatment, personally make a physical examination of the patient and shall report in writing three days after the beginning of the treatment to the state hospital commission, or if his office is located in any city

having one million or more inhabitants by the last federal census, to the department of health of such city, the name, address and age of the patient and the amount and nature of the drug prescribed or dispensed in the first treatment. Thirty days after beginning treatment the physician shall report in writing to the commission or department to which he first reported the case, the duration and results of treatment, and, if the treatment is continued for more than thirty days after beginning the same, shall make such further reports as may be required by such commission or department.

**2 Institutions** The foregoing provisions shall not apply to a physician treating any person in a public hospital, sanitarium, poor-house, prison or other public institution or in any private hospital, sanitarium or other private institution. All such institutions shall file with the commission at least once each year at a time prescribed by it a report covering such period or periods as it shall prescribe, giving the name, address, age, nature of the drug prescribed or dispensed and the duration and results of the treatment of each person treated for the habit of taking or using any habit forming drug.

**3 Annual reports of commission** The commission shall include in its annual report a compilation from all such reports, containing statistics giving the number of persons and cases, and so far as it may deem proper the localities of any such treatment, together with the nature of the drug prescribed or dispensed therein and the average ages of all such persons and the average duration of all such treatments and such other information as it may deem proper. The department of health of any city receiving reports shall send to the commission at such times as it may require, such statistical and other information from such reports as it may require.

**§ 436 Records confidential** Prescriptions, orders, records or reports required under this article shall not be open to inspection nor shall any information contained therein be divulged, except for the purpose of enforcing the laws of this state or the Harrison Act, or on the direction of the department of state police, to an officer of another state, for the purpose of enforcing the law of such state.

**§ 437 Fraud or deceit.** Any fraud, deceit, misrepresentation, subterfuge, concealment of a material fact or the use of a false name or the giving of a false address in obtaining treatment in the course of which habit forming drugs in excess of lawful quantity shall be prescribed or dispensed or in obtaining any supply of such drugs shall constitute a violation of the provisions of this article and shall not be deemed a privileged communication. The wilful making of any false statement in any prescription, order, report, or record required under this article shall constitute

a violation of this article. No person shall for the purpose of obtaining any habit forming drug falsely assume the title or represent himself to be a manufacturer, wholesaler, apothecary, physician, dentist, veterinarian, or make or utter any false or forged order or prescription for or label for a container of or for habit forming drugs, or affix such label, or alter, deface or remove any such label.

**§ 438 Commitment of addicts, procedure, discharge** **1** At request of addict. A magistrate, upon the voluntary application to him of any habitual user of any habit forming drug, may commit such person to any correctional or charitable institution maintained by the state or any political subdivision thereof, or private hospital, sanatorium or institution.

**2** Person accused of crime. Any court having jurisdiction of a defendant who is a prisoner in a criminal action or proceeding, if it appears that the defendant is an habitual user of habit forming drugs and is suffering as a result of such use, may likewise so commit such defendant, at any stage of such action or proceeding and direct a stay of proceedings, or suspend sentence or withhold conviction pending the period of such commitment.

**3 Discharge** Whenever the medical officer of the institution, or if there be no medical officer, the superintendent, shall certify to the committing magistrate or court that any person so committed has been sufficiently treated, or give any other reason which is deemed by the magistrate or court to be adequate and sufficient, he may in accordance with the terms of commitment discharge the person so committed, or return such person to await the further action of the court, provided, however, that when such commitment is to an institution under the jurisdiction of the department of correction, or other similar department in a city of the first class, where there is a parole commission established pursuant to law, such commission shall act in the place and stead of a chief medical officer for the purpose of making such a certificate.

**§ 439 Exceptions and exemptions not required to be negatived** In any complaint, information, indictment, or other writ or in any action or proceeding brought for the enforcement of any of the provisions of this article, it shall not be necessary to negative an exception or exemption, and the burden of offering proof of any such exception or exemption shall be upon the defendant.

**§ 440 Enforcement** This article shall be enforced by the authorities of the state and of the political subdivisions thereof engaged in the enforcement of the law and by the department of state police, the state hospital commission and the department or board of health of any city, provided in this article. Such

authorities and their agents shall have access at all times to all records and reports to be kept under this article

§ 441 Possession at time article goes into effect Habit forming drugs lawfully in the possession or under control of any person for the purposes of his business or profession at the time this article goes into effect, may be possessed by him with the same effect as if obtained on an order blank under this article, as long as he has on file a certificate from the department of health or board of health of the city in which his business is situated, or if not situated in any city, by the department of state police, stating the amount so possessed, which shall be open to the inspection of the authorities engaged in the enforcement of this article The certificate shall be issued by the proper department or board after such proof of the facts stated therein as it may require.

§ 442 Signature of reports Every copy of a record or report required to be sent to the department or commission or department or board of health shall be signed, if made by an individual by the individual, if made by a copartnership, by a partner, if made by a corporation or association, by an officer thereof

§ 443 Penalties A violation of any of the provisions of this article shall constitute a misdemeanor

§ 444 Constitutionality If any provision of this article is declared unconstitutional or the application thereof to any person or circumstance is held invalid, the validity of the remainder of the article and the application thereof to other persons and circumstances shall not be affected thereby

§ 2 Section four-b of such chapter as added by chapter five hundred and fifty-nine of the laws of nineteen hundred and thirteen, is hereby amended to read as follows

§ 4-b Duties of commissioner with respect to laboratories 1 The commissioner of health shall establish and maintain one or more laboratories with such expert assistants and such facilities as are necessary for routine examinations and analyses, and for original investigations and research in matters affecting public health He shall have authority to make, at the expense of the state, such examinations and analyses at the request of any health officer or of any physician He may enter into contracts with laboratories in localities accessible to the various portions of the state for the prompt examination of specimens received from local health officers or physicians and for the immediate report thereon at the expense of the state, provided that all such laboratories shall conform to standards of efficiency established by the public health council, and that no obligation shall be incurred by the commissioner in excess of the sums available therefor

2 There shall be at least one laboratory analyst who shall examine and analyze all habit forming drugs as defined in this chapter, submitted to him by any official of the state or of any political subdivision thereof engaged in the enforcement of the narcotic drug control law or any law of similar purpose and who shall be detailed by the commissioner to aid any such official of the state and to give evidence in any proceeding on behalf of the state in connection with such enforcement

§ 3 Chapter one hundred and thirty of the laws of nineteen hundred and twenty three and any and all acts inconsistent with provisions of this article are hereby repealed

§ 4 This act shall take effect immediately

*Comment* This is the same bill that made its appearance as Assembly Bill Int. No 1835, by Assemblyman Maurice Bloch, last year, and which was objected to in all of its features

County legislative chairmen, individual members of the State Society are urged to peruse the bill as it now reads and take into consideration the following communication which was sent to the introducer of the bill last year, who is now the minority leader in the Assembly

February 20, 1923

HON MAURICE BLOCH,  
Assembly Chamber  
Capitol, Albany, N Y

MY DEAR MR. BLOCH

The Medical Society of the State of New York wishes to thank you for the sane manner in which you have now grasped the drug situation, and the complete way in which such a question is to be investigated.

The fault lies not so much with physicians, save in rare instances where they have been easily apprehended through the investigations of the drug stores, wholesale and retail whence the only legitimate source of the drug can be obtained. Rather should the investigation tend toward the question of how the drug is obtained through illegitimate sources in crossing the border of our State by train, by auto and through hand to hand smuggling, and so comes into possession of the peddler of high and low degree.

Could the proposed legislative committee send inspectors into the drug houses, the latter could easily list such physicians as seemed to utilize more in quantity of these drugs and then by further sifting could determine if such physicians should be classed as peddlers

However, those physicians who would purchase the drug openly and of houses of record, should not, we judge, be the real peddlers since they would not thus openly leave themselves on a record of suspicion

The vital question as the physicians see it, is

how to shut off the illicit importation by smuggling, even as was shown in the case up the State where the legitimate dealer in rags imported from Germany some rags, and a few days after their arrival in their original bales, was visited by a man who stated that a mistake had been made in the delivery and that these rags were meant for another person. But the find had already been made, inasmuch as one of the bales had been opened and concealed therein was found a package of morphine which was immediately reported by the foreman to the mill owner, whose suspicion was thereby aroused, and the facts were reported to the proper officials.

As physicians we are glad to aid in any way we can for a betterment of these conditions, provided there is not placed on us the onus of more "paper work" in reporting and so forth, which in the past has come to naught and it is for this reason that we maintain there is sufficient of our share of the burden laid upon us in the Harrison Act, and further that more inspectors should be employed either by the Federal Government for this State, or by the State itself co-operating with the Federal Government in enforcing the federal act.

One has but to communicate with Dr. Simon of New York, to corroborate our contention, and if a questionnaire was to be submitted to the physicians of the State, we believe that the answers would show that physicians were using less and less of narcotic products and more and more of the synthetic drugs now being produced by the legitimate drug houses which have not the habit forming curse.

The other slant of the medical profession is the fact that there are two divisions in our scientific bodies, the one believing that the drug addict should be treated in a sanitarium and there confined until he is cured. Unfortunately this will not reach the higher strata of society wherein are found addicts, who obtain the drug legitimately from physicians and to a greater extent illegitimately from the underground sources, many of whom never come to a confession of their habit, these are the ones hard to reach, and again the question arises how to shut off their illegitimate obtaining of the drug and put them on a ration basis.

The second group of physicians are those who honestly believe that the addict should be treated under the care of a personal physician and where the habit does not conflict with the ability of the patient to transact the ordinary routine of a day's

work, such habit should be made confidential between the physician and the patient. However, here again enters the fact of the surreptitious obtaining from illegal sources by the patient of greater quantities of the drug or drugs without the knowledge of his or her physician and the undermining factor of the drugs which leads the patient to lie baldly to the physician, this again resolves itself into the ferreting out of the illegal importation.

There is undoubtedly a third group of physicians, small in number, who are totally unfamiliar with the management of the drug addict and who take on as patients addicts and attempt to cure them without sufficient scientific knowledge as to their management. Eventually these patients receive inadequate treatment and seek more of the drug from outside sources and so drift into the class which gradually increases its dosage and become lost to the profession when their source of supply in adequate amount has been satisfactorily established.

Possibly a very small percentage, perhaps as high as one-tenth of one per cent of physicians, have lost their sense of honor to the public and can be styled as "peddlers" on the same basis as the street hawker who delivers to the addict, not the pure drug, and at a price of gross profiteering akin to robbery, since the addict will pay any price asked to obtain the drugs when his moral fibre has been undermined. This class of physicians usually does not obtain the drugs in the legitimate manner but have their tentacles firmly fastened into the underground channels and there the source is found. Hence again enters the question of illegal importation.

We sincerely hope that the question may be arrived at sanely and we believe you will find back of our contentions the legitimate pharmacists, the pharmaceutical associations of the State, the courts which have come in contact with physicians and with addicts and those who have studied the question deeply, but we deplore as a body the innuendos which have been cast upon the medical profession that it alone is responsible for the traffic in these drugs, and trust that the investigations will bear us out in that we too have investigated and have arrived at the facts which I have stated above.

Seeking your indulgence for this brief as viewed from the standpoint of the medical profession, I remain,

Sincerely yours,

## RESOLUTION IN SENATE

January 2 1924

By Mr Love

WHEREAS, It is of common report that medicine is being extensively practiced throughout the State of New York by graduates of low standard institutions who have obtained diplomas from sources not recognized by New York State authorities and that the general practice of such so-called physicians has become so great as to jeopardize the public health of the state

Be It Resolved (if the Assembly concur), That a joint legislative committee is hereby created to consist of three members of the Senate to be appointed by the temporary president of the Senate and five members of the Assembly, to be appointed by the speaker of the Assembly to inquire into and ascertain the following facts:

If public health has been injured by the activity of self-styled medical institutions and "diploma mills," if graduates of any such low standard institutions are employed by the State Public Health Service or any other branch of the State government, if the standing of the state medical institutions and of our medical profession generally has been injured in other states by the action of such self-styled medical institutions and diploma-mills, if graduates of such institutions and diploma mills are now offering themselves as practitioners of medicine in the State of New York, if all of the laws and requirements as to registration are being observed by practitioners of medicine in the State of New York, if any institutions giving degrees in medicine in the State of New York are issuing diplomas or degrees to persons without sufficient knowledge and training as to legitimately en-

title them to such diplomas or degrees, to ascertain from the United States government officials if the mills have been used by such self-styled medical institutions and organizations known popularly as diploma mills for purposes of fraud in connection with the sale of degrees or diplomas in preparation for medical practice and to inquire to the fullest possible extent as to the legitimate transactions of all institutions or schools issuing such diplomas or degrees

Such committee shall choose from its members a chairman may employ a secretary, counsel stenographers and such other employees and assistants as may be necessary and fix their compensation. Such committee shall have power to sit within and without the city of Albany and within and without the State of New York have authority to subpoena and compel the attendance of witnesses, including the production of any book, paper, document or record pertaining to the subject of its investigation and shall have and possess generally all of the powers of a legislative committee.

Such committee shall report to the legislature of 1925 the result of its findings together with such remedial legislation as it may deem warranted in suggesting

Be It Further Resolved (if the Assembly concur), That the actual and necessary expenses of the committee in carrying out the provisions of this resolution not exceeding the sum of thirty thousand dollars (\$30,000), be paid from the legislative contingent fund upon vouchers audited and approved as provided by law

To Finance Committee

---

## Deaths

CAVANA MARTIN Sylvan Beach, Bellevue Hospital Medical College, 1872, Fellow American Medical Association, Member State Society, Surgeon Oneida Hospital Died January 9, 1924

FINCKE HARRY STARK, Astoria, Cornell Medical College 1903 Fellow American Medical Association, Member State Society, Assistant Visiting Physician St. John's Hospital Died January 20 1924

HOLT LUTHER LAWRETT New York City, College of Physicians and Surgeons of New York 1880 Fellow American Medical Association American Pediatric Society Academy of Medicine, Member State Society, Physician in Chief Babies' Hospital Consulting Physician Loundling Ruptured and Crippled, Lying

In Orthopedic and Nursery and Child's Hospitals Died January 14, 1924

KEYES, EDWARD L. Tuxedo Park, New York University, 1866, Founder and First President of the Association of Genito-Urinary Surgeons, Member State Society, New York Academy of Medicine, New York Dermatological Society, Consulting Surgeon Bellevue Hospital Died January 24 1924

MCLEAN MALCOLM, New York City, College of Physicians and Surgeons of New York 1869, Fellow American Gynecological Society, New York Academy of Medicine Member State Society Obstetrical Surgeon St. Andrew's Infirmary for Women, Consulting Surgeon Rhode Island Hospital Died January 16, 1924

how to shut off the illicit importation by smuggling, even as was shown in the case up the State where the legitimate dealer in rags imported from Germany some rags, and a few days after their arrival in their original bales, was visited by a man who stated that a mistake had been made in the delivery and that these rags were meant for another person. But the find had already been made, inasmuch as one of the bales had been opened and concealed therein was found a package of morphine which was immediately reported by the foreman to the mill owner, whose suspicion was thereby aroused, and the facts were reported to the proper officials.

As physicians we are glad to aid in any way we can for a betterment of these conditions, provided there is not placed on us the onus of more "paper work" in reporting and so forth, which in the past has come to naught and it is for this reason that we maintain there is sufficient of our share of the burden laid upon us in the Harrison Act, and further that more inspectors should be employed either by the Federal Government for this State, or by the State itself co-operating with the Federal Government in enforcing the federal act.

One has but to communicate with Dr. Simon of New York, to corroborate our contention, and if a questionnaire was to be submitted to the physicians of the State, we believe that the answers would show that physicians were using less and less of narcotic products and more and more of the synthetic drugs now being produced by the legitimate drug houses which have not the habit forming curse.

The other slant of the medical profession is the fact that there are two divisions in our scientific bodies, the one believing that the drug addict should be treated in a sanitarium and there confined until he is cured. Unfortunately this will not reach the higher strata of society wherein are found addicts, who obtain the drug legitimately from physicians and to a greater extent illegitimately from the underground sources, many of whom never come to a confession of their habit, these are the ones hard to reach, and again the question arises how to shut off their illegitimate obtaining of the drug and put them on a ration basis.

The second group of physicians are those who honestly believe that the addict should be treated under the care of a personal physician and where the habit does not conflict with the ability of the patient to transact the ordinary routine of a day's

work, such habit should be made confidential between the physician and the patient. However, here again enters the fact of the surreptitious obtaining from illegal sources by the patient of greater quantities of the drug or drugs without the knowledge of his or her physician and the undermining factor of the drugs which leads the patient to lie baldly to the physician, this again resolves itself into the ferreting out of the illegal importation.

There is undoubtedly a third group of physicians, small in number, who are totally unfamiliar with the management of the drug addict and who take on as patients addicts and attempt to cure them without sufficient scientific knowledge as to their management. Eventually these patients receive inadequate treatment and seek more of the drug from outside sources and so drift into the class which gradually increases its dosage and become lost to the profession when their source of supply in adequate amount has been satisfactorily established.

Possibly a very small percentage, perhaps as high as one-tenth of one per cent of physicians, have lost their sense of honor to the public and can be styled as "peddlers" on the same basis as the street hawker who delivers to the addict, not the pure drug, and at a price of gross profiteering akin to robbery, since the addict will pay any price asked to obtain the drugs when his moral fibre has been undermined. This class of physicians usually does not obtain the drugs in the legitimate manner but have their tentacles firmly fastened into the underground channels and there the source is found. Hence again enters the question of illegal importation.

We sincerely hope that the question may be arrived at sanely and we believe you will find back of our contentions the legitimate pharmacists, the pharmaceutical associations of the State, the courts which have come in contact with physicians and with addicts and those who have studied the question deeply, but we deplore as a body the innuendos which have been cast upon the medical profession that it alone is responsible for the traffic in these drugs, and trust that the investigations will bear us out in that we too have investigated and have arrived at the facts which I have stated above.

Seeking your indulgence for this brief as viewed from the standpoint of the medical profession, I remain,

Sincerely yours,

manufacture this unnecessary drug? There are only four great drug-manufacturing countries—Germany, Switzerland, England, and America. If we take the lead, if medical opinion in this country declares, by backing the proposed legislation, that heroin is unnecessary, in view of its dangers to the community, it would carry enormous weight with medical opinion in the other three countries. In this way, all manufacture of heroin would cease, and there would be no danger of smuggling. In regard to Great Britain, I am told on reliable information that legislation to suppress the manufacture of heroin is already being considered.

Let us keep the lead that we have earned, in all international considerations of the narcotic question. Let us send our delegates to the next convention (which will consider, among other things, this question) to be called by the League of Nations in November at Geneva, with a copy of an accomplished measure. We must cross out of our pharmacopia completely this insidious product of synthetic chemistry that is creating daily new addicts among our youth.

Very truly yours,

HLEN HOWELL MOOREHEAD,  
Secretary, Committee on Traffic in Opium  
Foreign Policy Association

### *Editor, New York State Journal of Medicine*

Allow me to congratulate you on the great improvement of the JOURNAL. The Legal Department, by our able Counsel G. W. Whiteside, is excellent. What are we, or rather, the public going to do about it? In the language of the Bible

"Is there no balm (drugs) in Gilead?  
Is there no physician there? why then  
Is not the health of my people recover?"

The Chiropractors are guilty of the following crimes

- 1 They practice the healing art illegally
- 2 They practice fraud upon the public.
- 3 They endanger the public health
- 4 By combining together in a society, they are guilty of conspiring against the public health

What can be done to eradicate this colossal fraud upon the public?

I suggest the following remedy

1 Reprints be published to expose the fraud and be sent to our able Governor, Senators, and Assemblymen

2 As this is a civic question for the protection of the public health, reprints be sent to the clergy of all denominations with the request they should take it up as well as they took up the prohibition question

3 To request the public press not to accept Chiropractic advertisements, on the ground that it is a fraud upon the public.

4 To ask the Postmaster General to exclude their advertisements from the mail on account of being a fraud upon the public

5 As Chiropractic manipulations are merely massaging, and nothing else, the A. M. A. should start a movement throughout the United States that in the states where they are legalized to practice that the term Chiropractic be defined massaging or hand manipulating, so that the public

should not be misled that it is some mysterious science

6 As the health the life of every citizen, the honor of the wives and daughters are entrusted to the profession of the healing art it is, therefore, required that a certificate of good moral character be shown by every medical student before he is allowed to graduate and practice medicine, and in case the Chiropractors be licensed to practice massage, they should also be required to prove good moral character. Those practicing illegally at present be debarred on account of being criminals and therefore not of good moral character

7 As this is a question of great public interest it should be taken up by Medical Legal Societies and the public press, as the press is molding public opinion, and the press as a body is honest

I have asked many times what influence is there behind the illegal practitioners that no one dares to interfere with them? This question is answered by our able Counsel Mr. Whiteside, in two words, "political expediency." Are the Chiropractors above the laws? If they are law-abiding citizens why don't they stop their illegal acts and come before the Legislature with clean hands and say we found out we are illegal practitioners in this state, we stopped practicing, we ask you to legalize us. Our able Counsel well expresses "Legislation that makes law breakers a privileged class is not a proper exercise of the state power"

The medical profession, as the legal guardian of the public health, must insist that no one be allowed to practice the healing art except the legally scientific practitioner

As constant vigilance is the price of liberty so constant war against quackery, charlatanism and fraud in the healing art is the price of scientific medicine in the protection of the public health

# State Department of Health

## INFANT MORTALITY LOW IN WHITE PLAINS

Figures recently obtained from the local registrar of vital statistics show that for 1923, White Plains had the extremely low rate of 38 infant deaths per 1000 living births. This city for years has had a most excellent baby health service and has recently established a prenatal clinic. There has been a steady reduction in the infant mortality rate in White Plains since 1911 when it was 130 per 1000.

## PHYSICIANS SHOULD REGISTER BIRTHS

The Division of Vital Statistics reports that there are some communities in New York State where birth registration is so defective as to warrant investigation. In the city of Cohoes during a recent 12 months' period there were 22 unregistered births out of each 1000 which occurred, some other cities showed from 10 to 12 unreported births in each 1000.

Physicians not promptly reporting births which they attend lay themselves open to prosecution.

## WORK OF THE DIVISION OF TUBERCULOSIS

During the past three years over 250 clinics have been held in various parts of the State by the Division of Tuberculosis. At these clinics 6421 persons have been examined and 4401 x-ray pictures have been made. None of these examinations has been made except upon the written request of the family physician, and all reports have been sent to him.

## KOREA LIKES NEW YORK STATE HEALTH PAMPHLETS

Commissioner Nicoll reports that he recently received a letter from the Seoul Foreign School Association in Seoul, Korea, asking for enough copies of the Department publication, "Co-operation in the Control of Communicable Diseases Among School Children," so that each home may receive it.

## FOREIGN HEALTH OFFICIALS OBSERVE OUR METHODS

Recently several distinguished foreign public health officials visited the State Department of Health at Albany. Among them were Dr. Steven Weis, Sectional Councilor, Ministry of Health, Hungary, Professor H. N. Neeb, retired chief of

the Military Service in the Dutch East Indies, and Dr. Andrew Balfour, Director of the School of Public Health, London, England.

## NEW REGULATIONS OF THE PUBLIC HEALTH COUNCIL

### *Public Health Nurses*

Public health nurses appointed after January 1, 1924, by public authorities, shall possess the following qualifications:

1 They shall be not less than 21 years of age at the time of their appointment,

2 They shall be registered nurses,

Public health nurses appointed after January 1, 1925, by public authorities shall have completed a course in public health nursing approved by the Public Health Council,

*Provided*, however, that upon application in writing by the appointing power or by the nurse, these qualifications may be waived by the Public Health Council.

### *Qualifications for Directors of Laboratories*

Directors of laboratories which are to receive state aid under the provisions of Chapter 638 of the Laws of 1923 shall have the following qualifications:

1 They shall possess the educational requirements for the degree of doctor of medicine prescribed by schools recognized by the Regents of the University of the State of New York,

2 They shall have had special training of at least two additional years in pathology and bacteriology approved by the Public Health Council,

*Provided*, however, that under special conditions either or both of these qualifications may be waived by the Public Health Council.

### *Qualifications for Bacteriologists-in-charge of Laboratories*

Bacteriologists-in-charge of laboratories which are to receive state aid under the provisions of Chapter 638 of the Laws of 1923 shall have the following qualifications:

1 They shall possess the educational requirements for a doctorate degree in science, public health, or medicine as prescribed by a University holding membership in the Association of American Universities,

2 They shall have had special training or experience of at least two additional years in bacteriology approved by the Public Health Council,

*Provided*, however, that under special conditions, either or both of these qualifications may be waived by the Public Health Council.

## NEWS NOTES

### PRINCIPLES OF PROFESSIONAL CONDUCT

THE Committee of the Council on the Censorship of the Referendum vote on the Principles of Professional Conduct of the Medical Society of the State of New York, begs leave to submit its report

Total vote cast	5,433
Votes in favor of adopting	5,331
Votes opposed	102

(Signed) E. ELIOT HARRIS Chairman  
ORRIN SAGE WIGHTMAN  
JOSHUA M. VAN COTT  
GEORGE W. WHITESIDE

The above report of the committee was presented to the Executive Committee of the Council on January 10 1924, and was officially received, thus completing the procedure necessary to make the principles binding on the members of the Medical Society of the State of New York.

The *Principles of Professional Conduct* take the place of the *Principles of Medical Ethics* which were adopted by the State Medical Society in 1906 after a referendum vote. The 1906 principles were identical with those of the American Medical Association and the discussion which led to their adoption was a fundamental part of the discussion which led to the amalgamation in 1905 of the New York State Medical Association and the Medical Society of the State of New York.

The American Medical Association revised its principles of Medical Ethics in 1912, but the Medical Society of the State of New York waited until 1922 before taking steps to revise its principles.

In 1922 the House of Delegates voted to appoint a committee on revision. The committee, appointed by the President, consisted of Dr. E. Eliot Harris, Chairman, Dr. Samuel A. Brown, Dr. William Darrach, Dr. Grant C. Madill, Dr. Walter L. Niles, Dr. George D. Stewart, and Dr. Henry Lyle Winter.

This committee reported a revision of the principles to the House of Delegates on May 21, 1923. Its report was adopted unanimously. The principles were printed on page 255 of the June issue of the NEW YORK STATE JOURNAL OF MEDICINE, and a copy sent to each member of the Medical Society of the State of New York.

The House of Delegates voted to submit the principles to a referendum vote of the Society. On December 5th the Secretary sent out formal ballots to all the members, and on December 10th

a follow up postal card was sent out. The polls closed on December 15th and the result was as announced by the Committee.

According to the Constitution of the State Medical Society the number of members voting must be a majority of the entire membership in order to make the vote legal. The number of members on December 5, 1924, was 10,125 and thus the referendum was legal and the Principles of Professional Conduct are now binding upon the members in all questions involving ethics and professional conduct.

### CADUCEUS POST, AMERICAN LEGION

The annual meeting and dinner of Caduceus Post American Legion was held on the evening of January 12th at the Yale Club, East 44th Street. This Post is composed of medical men, a large proportion of whom served in Camp Upton. One hundred and fourteen members were present. Dr. Graeme Hammond was elected president. The retiring President Dr. Henry C. Coe, presided and paid a glowing tribute to the chaplains with whom he had served in France.

General Robert Lee Bullard, Commander of the Second Corps Area, said that peace talk was the only present sign of war. He spoke of the necessity of the presence of a medical officer in front line service and said that soldiers had a right to expect that immediate attention would be given to wounds to which they were inevitably exposed. General Bullard said that the medical profession headed the list in the proportion of reserve officers that are required in the various branches of the service. The general's speech was a tribute to the medical officers in the World War.

Edward F. Spafford, State Commander of the American Legion, spoke about the Veterans' Mountain Camp, of which the first suggestion came from Dr. Samuel Lloyd, first commander of Caduceus Post. Commander Spafford made a plea that the members assign their state bonus money to the Camp and estimated that ten million dollars could be raised in that way. This would provide an endowment which would go far toward relieving veterans who will become disabled from old age and other unavoidable causes.

United States Senator James W. Wadsworth spoke of military preparedness as the best of all preventives of war, and commended the physicians for their preparedness.

## RABIES IN ROCKLAND COUNTY

Four persons in Suffern have taken the anti-rabic injections following bites by dogs which have been proven to have rabies. The first case occurred in May, 1923, in a rural district of New Jersey, just outside of Suffern. The health officer of Suffern traced the affected dog and warned the community, but little preventive work was done. In November, 1923, a second dog went through Suffern fighting with other dogs, and two women who attempted to separate the fighters were bitten by the stray dog, which was killed and proven to have rabies. The Board of Health at once put a quarantine on all dogs in the village and instructed the police to seize or kill all dogs that appeared on the streets without muzzles or leashes. Seven dogs known to have been bitten by the stray dog were killed, but the owners of four others that were bitten refused to dispose of their dogs. Anti-rabic treatment was given to the two persons who were bitten. The cases were reported to the State Department of Farms and Markets and two inspectors were sent to Suffern, but nothing further was done by that department. As is usual in conditions of this sort, the local health officer was the most active official in the control of the outbreak. Dr. W. R. Sitler, the health officer, received the full support of the local Board of Health and of the State Department of Health, but the attitude of the general public was that of indifference. Still the seeming indifference may have been due to the confidence of the people in their physicians and the Health Department. At any rate, the present attitude is a vast improvement over the wild panic which always followed the appearance of a mad dog a generation ago.

---

## TOUR AROUND THE WORLD

A large private yacht is making an extended tour around the world. Any doctor interested in the opportunities offered for medical research in tropical countries, please write immediately to Barry Buchanan, Players Club, 16 Gramercy Park, New York. The trip is offered in exchange for any medical service that may be required en tour.

BARRY BUCHANAN

---

## BRONX HOSPITAL BOARD

At the last meeting of the Medical Board of the Bronx Hospital, New York, Dr. William J. Robinson was re-elected president for the fourteenth successive year. Dr. M. Aronson was elected vice-president, and Dr. N. Goodfriend, secretary.

## BRONX COUNTY MEDICAL SOCIETY

The tenth anniversary of the organization of the Bronx County Medical Society was celebrated by a dinner at the Concourse Plaza, East 161st Street, Bronx Borough, on the evening of January 9th. The attendance was five hundred and forty and included the wives of the members and guests.

Dr. N. B. Van Etten, the first President of the Society, presided as toastmaster.

Dr. Van Etten, in his introductory remarks, reviewed the history of the Society. The preliminary petition from members of the State Medical Society residing in Bronx County was received by the Council of the State Society on December 5, 1913, and the Council thereupon called a mass meeting of the physicians of Bronx County on December 16th. At this meeting, Dr. William Francis Campbell, President of the State Society, presided, and appointed a committee on organization. The meeting for permanent organization was held on January 9, 1914, with Dr. Campbell again presiding. A charter was presented to the Society by Mr. James Taylor Lewis, Counsel for the State Society, a constitution and by-laws were adopted, and the following officers were elected:

President, Nathan B. Van Etten; First Vice-President, Francis L. Donlon, Second Vice-President, William A. Boyd, Secretary, Herman T. Radin, Treasurer, Edward F. Hurd.

The organization meeting was evidently full of interest for it adjourned at 2:30 in the morning of January 10th.

The charter members of the county numbered 118, of whom 14 have died. Nearly 600 members are now carried on the rolls.

Dr. Orrin S. Wightman, President of the Medical Society of the State of New York, spoke of the activities of the State Society and of his ambitions for a square deal for every practitioner of medicine.

Dr. Podvin, the President-elect of the Bronx County Society, humorously outlined his desires for the Society during his administration.

Dr. George David Stewart, the President of the Academy of Medicine, spoke in his usual brilliant manner on the future of medical education.

A dance followed the dinner and continued until the usual time for adjournment of this lively Society, at about 2:30 A. M.

## MEDICAL SOCIETY OF THE COUNTY OF ALBANY

The first regular meeting for 1924 was held at the auditorium of the Municipal Gas Company, 124 State Street, on Tuesday, January 15. It was called to order by the chairman, Dr Edgar A. Vander Veer at 8:40 P. M. Ninety-one physicians, including members of neighboring counties, were present.

The meeting proceeded immediately to the scientific program on motion of Dr A. J. Bedell, which was carried.

The scientific program consisted of a "Symposium on Quacks." Dr Orrin Sage Wightman, President of the Medical Society of the State of New York, gave an address on "The Medical Profession and the Quack." Dr George W. Whitehead, Counsellor of the Medical Society of the State of New York, read a paper on "The Public and the Quack." Dr A. S. Downing, State Commissioner of Higher Education spoke on "The State and the Quack." Dr Matthias Nicoll, Jr., New York State Commissioner of Health addressed the Society on "Public Health and the Quack."

The Society went on record as unanimously approving the principles of the proposed re-registration bill, and urging every physician of this Society to make a supreme effort to be present at the future hearing on the proposed medical legislation and to request neighboring county medical societies to do the same, also that the Secretary notify the Secretary of the Medical Society of the State of New York of the action taken by this Society.

In the general discussion, Dr James F. Rooney emphasized the importance of a unified action of the medical profession at the hearing on the proposed medical legislation before the State Legislature.

## MEDICAL SOCIETY OF THE COUNTY OF CATTARAUGUS

ANNUAL MEETING SALAMANCA, JANUARY 8, 1924

At the annual meeting of the Medical Society of the County of Cattaraugus, held in Salamanca, January 8th, the following officers were elected for the ensuing year:

President, Dr S. H. Bennett, Little Valley, N. Y., vice-president, Dr J. P. Garen, Olean,

N. Y., secretary treasurer, Dr Myron E. Fisher, Delevan, N. Y. Delegates to State Society, Dr Myron C. Hawley, Randolph, N. Y. Alternate delegate to State Society, Dr J. E. K. Morris, Olean, N. Y.

Dr John R. Williams of Rochester gave an illustrated address on "Diabetes, and the Insulin Treatment."

Dr F. H. Richardson, representing the State Department of Health, gave an address on Breast Feeding.

Drs H. C. Allen of Gowanda and Maurice G. Sheldon of Olean, were elected to membership.

Dr W. B. Johnston, Ellicottville, J. A. Taggart, Salamanca, R. B. Morris, Olean, M. C. Hawley, Randolph, and Ira W. Livermore, Gowanda, were elected Censors.

There was a good attendance and the meeting was a very profitable one.

## MEDICAL SOCIETY OF THE COUNTY OF NASSAU

At a meeting of the Medical Society of the County of Nassau held at Mineola, N. Y., on December 18, 1923, the following resolutions were adopted:

WHEREAS, There has been called from his earthly labors to everlasting peace and rest our dearly loved friend and colleague, Doctor James S. Cooley, and

WHEREAS, Throughout long years, his service to the cause of medical organization was that of wise counsel, unflinching enthusiasm and unstinted toil, never discouraged by indifference nor incensed by injustice, and

WHEREAS, His place in our councils can never be adequately filled, now, therefore, be it

Resolved, That the Medical Society of the County of Nassau, in full realization of the irreparable loss it has suffered, declares a grateful acknowledgment of the services that he has rendered, gives reverent thanks for the peaceful circumstances of his passing, and expresses to his family its sincere condolence in their hour of sorrow, and be it further

Resolved, That these resolutions be spread in full upon the minutes of the Society and that a copy be sent to the bereaved family, and to the Medical Society of the State of New York.

# PRUNES

(From the Bronx County Medical Society Decennial)

The dinner slogan "Watch your hip"

Members may now be at ease to speak from the floor, as our new President will not psycho-analyze every new motion they may make

Owing to the great skill of its physicians the Bronx County birth rate is the lowest" (Loud applause)

The rolling gold of the Caesars,  
Alaskan gold and Siberian gems,  
Pearls brought forth by daring pearl fishers,  
From the depths of the Atlantic  
Silks weaved of golden threads by Persian weavers  
Egyptian art and Oriental treasures,  
Transported by Phoenician merchants  
All this wealth, nay, more,  
At the feet of "Psychic Conquerors" was laid  
Just as once "Scopolamine"  
By great Obstetricians into gold was transmuted  
But new gods men create,  
To fit the fashion of the day  
Insulin is the god now  
That brings wealth into the coffers of the few  
Watch the Great, and the mighty horde that hoards  
Hail Beware, arrogant Insulin pushers  
Other gods, newer ones, will come,  
New Bantings will arise,  
Beware! The fates of the "psyches"

The Grand Vizier of the Academy returned from abroad, with a lowered blood and higher intellectual pressure. His mentality is as dazzling as ever, his speech still encloses truths in transcendental humor. He plays with his words as musicians play with sounds. He combines harmony with staccato, ecstasy with reality serious thoughts sidereal in their loftiness with paradoxes of witticisms that strike deep and soar high. He combines the wisdom of Aristotle, the eloquence of Cicero, the strategy of Foch, and the brilliant diction of Johnson. You will hear him speak at our Dinner on January 9th, 1924

*We must now realize  
To all things Pasteurize  
Doc Gettlinger's telling us how  
So that they will not spoil  
You must bring to a boil  
The baby, the milk and the cow*

This column offers a prize to any one who can show any Medical Journal, National, State, City, or Village monthly, or weekly, which publishes less than twenty-five articles a year coming from Rochester, Minn

## The Staff Room

We will always remember most kindly our old staff room with its long, oak table in the center, comfortable Windsor chairs all about, the bulletin board which we sometimes read the book which we signed when we happened to think of it or on the days when we came especially early. Up on the top shelves are the busts of the older medicos—Hippocrates, Galen, Dupuytren, and others. How these old gents would blink at us and wonder how we do it with so much to be known, yet so little knowledge, so much to do, and so little to do it with, and yet we do carry on. And there, in

the lower shelves, are the library books, plenty of them, dust covered, unread, antedated, antiquated, space-filling ornaments. We can still see the old crowd when Rounds are all over and the informal discussion of the cases has ceased, and just before we went for our usual 5 o'clock coffee (that used to start trouble at home, when we came to dinner at 6 with no appetites) what a great line of stories we could hear

## Deliriums

### To G. D. S.

And if Surgery you want to learn  
With me on Friday morn adjourn  
To Bellevue Halls, and at the feet  
Of the White Robed Sultan incense burn

With him the seeds of wisdom sow  
It matters not if you be slow  
We'll listen to the Prophet's voice  
And from him learn all there's to know

He moves and thunders in the pit,  
We learn the wisdom of his wit  
The youths are stirred—their eyes all ask  
"Will we this great profession fit?"

The Master Surgeon moves his hand  
And having moved, the gonerous gland  
Does vanish—and youths amazed all vainly  
Try the mystery to understand

One moment in annihilation's waste  
One moment of the "Either Life" to taste,  
And mighty Mohammed wields the knife  
Come out, Appendix. Do make haste

Oh, great Alchemist, ruler absolute,  
Who does the "Dubs" info wise men transmute  
But some will pass and some flunk  
The law of average to execute.

For some we loved, the loveliest and the best,  
That from his vantage rolling time pressed,  
They went to College a year or two  
And flunked and crept silently to rest

Heredity is not as strong as one might gather from the literature. We know of a family in which the father had a congenital heart lesion, the mother an acquired heart affection, and yet she was recently delivered of a child without a murmur

## Vital Statistics

This issue of The Bulletin does not exceed 90,000 copies

Six new buildings were completed last month on the Grand Concourse. Result Twelve new specialists. During the year 34,672 babies were born in the Borough. 69,344 more tonsils to be removed.

Have you a little Sanitarium in your home? The House Surgeon had ordered for Mrs. Smith "Murphy Drop," to be given "two hours on and two hours off." The nurse's night report read "Patient slept well between Murphys."

At our Silver Jubilee, fifteen years hence, when some medical student of today will be our Society President, there is one office the incumbent of which we now know, Dr. I. J. Landsman, Secretary

## STERILITY IN THE MALE\*

By J STURDIVANT READ, M.D.

BROOKLYN N Y

FIFTY years ago when the question of childlessness in marriage was presented to the physician in the large majority of cases the search for the cause was directed to the female only. This state of affairs is still very common. The following paper is based upon observation of 253 males referred to me by other physicians from whom the wives had sought advice because of lack of progeny.

Many of these cases have been observed as long as five years.

Analysis of spermatic fluid (condom specimen) in 253 cases of childless marriages

Normal	86	34	%
Abnormal	167	66	%
A Complete Azoospermia	59	31.5	%
Causes of			
(1) Injury	2		
(2) Deficient development (small testicles)	8	13	%
(3) Inflammation of unknown causes	10	17	%
(4) Inflammation due to In gripe	1		
(5) Inflammation due to gonorrhea	38	64	%
B Partial Azoospermia	108	64	%
Causes of			
(1) Injury	0		
(2) Deficient development (small testicles)	8	7	%
(3) Inflammation from unknown causes	42	39	%
(4) Inflammation due to In gripe	1		
(5) Inflammation due to gonorrhea	56	52	%
(6) Deficiency due to excess coitus	1		

The examination consisted in gross observation of external genitals, examination of prostate and vesicles per rectum, exploration of the urethra, a microscopic study of the prostatic fluid, and a complete study of the spermatic fluid in the "condom specimen." The condom specimens were secured as follows: Advice was given as to use of condom, and instructions to refrain from coitus four days before specimen was secured. The patient was ordered to tie a knot in the condom and suspend the part containing the fluid in warm, not hot, water (27° C better than 37° C). The bottle was to be wrapped in a warm cloth and carried under the arm next to the body, and to be delivered for examination within two hours.

K. Y. Jelly is the best lubricant. In one case of seeming necrospermia in a healthy subject the cause was found to be in the acidity of the powder inside the condom.

In doubtful cases there should be three examinations at weekly intervals.

For those who are unable to secure condom specimens other directions must be given. There is much that is unknown about the physiology of spermatogenesis. For the present we must rely on deviations from the normal appearance of the fluid to formulate our diagnostic and prognostic pronouncements. The two main considerations are the spermatozoa and the fluid (prostatic and vesicular) in which they occur—the so-called spermatic fluid. We are all familiar with many experiments on the lower animals and seemingly rats can be impregnated by spermatozoa drawn directly from the testes, but in natural human relationships a healthy fluid is as necessary as vigorous spermatorrhea for successful impregnation. In my own mind gold fish in a bowl of water visualizes the problem.

*The Spermatozoa* The number, shape and

degree of motility of the spermatozoa are the factors to be considered

The number of spermatozoa emitted at one ejaculation has been estimated by Lode to be 260 millions. In the ordinary microscopic field 30 to 60 should be seen. Their normal shape and motility must be learned by observation.

Azoospermia is generally due to mechanical blockage in the genital tract, but it may be due to absence of spermatogenesis in the testicles. I would here emphasize the fact that occasionally an apparently healthy man, free from any venereal disease past or present, in whom coitus is reported as normal, will upon examination prove to be without spermatozoa. I have seen this condition four times and can only speculate as to the cause. In these cases the testicles were normal every way to palpation. There may be some organic defect in the spermatogenic cells or more likely a mechanical blockage of the vas due to a developmental defect or to an inflammatory infection, not venereal, in very early childhood, which has left an inflammatory deposit somewhere in the vas. Occasionally azoospermia is a transitory phenomenon. I have seen one such case. There were two examinations with no spermatozoa found. Six months later there were many.

*Oligozoospermia* This may be due to (a), constitutional causes of any kind which cause marked impairment of the general health, (b), sexual excesses, (c), a developmental organic defect, small testicles, etc., or a possible endocrin deficiency, (d), certain nervous diseases, and (e), most important because most common, local inflammatory disease, especially of a chronic nature, venereal or otherwise.

With oligozoospermia is usually associated deformity of some spermatozoa, and partial or complete absence of motility, the degree and amount of which modify prognosis.

*The Prostatic and Vesicular Fluid* The normal reaction is alkaline. In 253 cases the litmus turned red in two cases. One proved to be due to some acid in the condom. The other remained persistently acid though the fluid was collected directly into a warm, dry glass.

The normal consistency of the fluid varies, but if a marked change occurs, either on the plus or minus side, it is accompanied by other changes. Pus in the fluid is indicative of chronic inflammation. When it is present in excess, some of the spermatozoa are apt to be abnormal, but I have seen many of normal shape and motility in its presence. In changes in the prostatic fluid from normal there is very often a great increase of the amyloid bodies. This may occur with or without the presence of pus. Its significance is unknown, but it is associated with abnormal physiology. My own opinion is that it indicates

a circulatory stasis which may be of either an inflammatory or non-inflammatory nature. Abundance of lecithin granules is a healthy sign.

*Treatment* In the light of our present knowledge the treatment in the male must aim to produce a normal number of normal spermatozoa, and to insure that the medium in which they move is normal, in so far as we understand what normality of this fluid (secretion from prostate and vesicles) consists.

The building up of the individual, through diet, hygiene, correction of devitalizing habits, especially sexual, and the administration of glandular extracts are the means to be employed for the proper functioning of the spermatogenic cells.

Alcohol in excess probably produces a devitalizing influence on the spermatozoa.

Tobacco in large excess over a long period decreases sexual power in some men.

Excessive coitus reduces the number of spermatozoa, and sometimes lessens motility.

It is wise to state that the employment of orchitic extracts is experimental, but in certain cases produces a sensation of well being, and may have a direct action on the spermatogenic cells.

In many cases the spermatozoa appear normal, but the medium in which they move is abnormal. This abnormality consists in changes in the consistency of the fluid, in its normal alkalinity (one case), in abnormal increase or decrease of the usual elements found in the prostatic and vesicular fluid, or the presence of abnormal elements, generally pus, in varying amounts, and bacteria. In all cases which we have thought offered chances of improvement by treatment, we have considered the alterations in the spermatic fluid due to passive congestion in the prostate and vesicles, with which may or may not be associated signs of inflammatory changes.

So our problem has resolved itself to the employment of measures designed to relieve congestion, to promote absorption of inflammatory products and to the destruction of foreign bacteria. For this purpose the means which we employ are massage, heat, the use of the faradic current to the prostate, and measures to promote absorption of small round cells infiltration around the opening of the ejaculatory ducts and the insuring of patency of the vas.

Our own practice is to use these remedies two or three times a week for two months, and then to examine a condom specimen as a control. If improvement is manifest, we continue until three such courses, with a month's interval between, have been given. It is surprising to see what definite improvement does take place in some of these cases, and a fair number have reported

pregnancies in the wife (of course we have to remember that corrective measures have been applied to some of the women, but there are quite a number in whom pregnancy has been reported after treatment and whose wives had been pronounced normal always) The index of improvement in these cases consists in return to normal of the numbers and motility of the spermatozoa, and a lessening of deformed ones The presence of pus in the fluid is always indicative of inflammatory changes, and its steady diminution in the expressed secretion is generally accompanied by other signs of improvement In nearly all of my abnormal cases there has been a great increase in the number of amyloid bodies Often in cases in whom no evidence of inflammatory disease of any kind, past or present, could be found, this marked increase of amyloids would be the only alteration in the fluid Massage, heat, etc., would be followed by diminution of amyloids to normal, and in some cases pregnancy was reported

Lecithin granules are stated to be indicative of healthy prostatic fluid, and its disappearance and reappearance are said to be associated with abnormal and normal conditions in the prostate This has not been a constant factor

We are aware that there are many obscure physiologic genetic problems, but for the family advisor in these childless marriages certain clinical facts may be emphasized

1 The question of sterility is a dual one the husband must *always* be examined

2 Gonorrhea may cause sterility in the male not only by mechanical blockage of the vas, but also by producing changes in the prostatic fluid

3 Other bacterial infections of the genito-urinary tract may cause changes similar to those of gonococcus

4 Absence of venereal disease, and a history of normal coitus with ejaculation of fluid, is no sure evidence of procreative power on the part of the male

5 A certain number of males who have been married many years and whose seminal fluid has been found deficient have improved under the above outlined treatment, and have begotten children In every childless marriage every husband should be properly examined before the wife is pronounced at fault

6 In selected cases surgical measures to secure a patent vas have been successful

Treatment to the prostate and vesicles is carried out as follows

With the patient lying on his side a prostatic thermophore is introduced and kept at a constant heat by means of an electric thermophore machine After five or ten minutes gentle, but thorough, prostatic and vesicular massage is given An irrigation through the urethra into

the bladder, without catheter, completes the treatment

Faradic massage to the prostate stimulates the muscles of the prostate and the surrounding muscles, for often oozing of fluid will be seen during the application of the current Massage and irrigation are used with this procedure

Introducing ten ounces of silver nitrate solution (1/4000) into the bladder, then massaging and letting the patient empty the bladder is another useful procedure The above three measures are given alternately every two or three days The urethra must be relieved of stricture and submucous infiltrate by appropriate treatment

### Discussion

DR. EDWARD REYNOLDS, Boston Marital unfruitfulness has always been considered among a majority of all people in all times as a great misfortune, even as a curse, and marriage unblessed by offspring is one of nature's saddest tragedies

From whatever point of view a fruitless union is considered, the result is detrimental to the best interests of society, and the exceptions due to chronic disease of one or both parties are few and far between

Seldom is a childless marriage a happy one and only too often the sterility becomes a disruptive factor that destroys the integrity of the household

Nature, in her infinite wisdom has endowed every woman with a maternal sense and a desire for children, and if this natural maternal longing is not gratified, her very nature will frequently become changed, and her mind take various abnormal slants hardly conducive to her happiness, or to the happiness of those around her

The presence of children in the household is the strongest factor in maintaining the happiness and integrity of the home and in the development of the home life which is so vital to the advance of the race

The highest rate of sterility today is to be found in over-civilized communities, and a study of the abnormal conditions of life in such communities will show many evils responsible for the increased sterility from which they suffer Alcohol, vice, and immorality are responsible for a very large percentage of sterility Consanguineous marriages have an evil influence. A single child the feeble fruit of worn-out stock, is usually low in fertility

Three years of normal married life should pretty well decide the question of probable sterility, for only about 7% of the fertile bear their first child after that time

The steadily progressive desertion of the land for the cities—today our urban population exceeds the rural—must be met with and fought at every turn

Modern materialism is pre-eminently the peril of the American family, for it leads in all classes to a restriction in the size of the family. It has so conquered the life of the city that all hope for the future would seem to lie in the country and suburban districts. Every effort should be made to help the upper working class, who have a real interest in the future of the country, but, where living on meagre, fixed incomes, their actual economic position is below that of the lower working class, even that of the manual laborer. The State is far from fulfilling its obligations towards lightening the burden of large families. A liberal endowment of motherhood in all classes is urgently needed. The preservation of the nation will depend upon the great middle class,—those who have risen above the confining and retarding environment of poverty, but have not acquired the idle migratory habits of the rich.

The taxation of unmarried adults has much to be said in its favor, and a great deal could be done by wise relieving of the early financial burden of growing families. The woman is entitled to every help in the performance of those duties which are her natural inheritance.

With a high and increasing rate of sterility among her native born, and a birth rate padded by the immigration of more fertile races, the United States faces a great crisis today. Among our native born, sterility is increasing, fertility decreasing, and there is an ever-growing desire to avoid parenthood. Restriction of immigration, intelligent governmental help to parents, and a reduction in the preposterously high cost of living, must soon be accomplished facts if a truly American race is to survive.

Sterility is of paramount importance to the

race, and is a subject well worthy of continued careful and faithful study.

When all examinations have been made and we take up for final review the recorded facts in an individual case, a more or less definite cause for the sterility can usually be settled upon. The treatment for this may be simple and free from danger, or it may be complex and call for operative measures, the carrying out of which would be attended by a very definite surgical risk. In such cases do the danger and uncertainty of result warrant the surgeon in advising such a risk, or the patient in accepting it? In deciding such a question we have no precedent in surgery to go by, for from time immemorial surgical operations have only been advised to save life or to relieve suffering where the ethical ground has always been firm under our feet. Now we are facing an entirely new situation. Our position rests on no such firm foundation of fixed opinion, but rather on the uncertain and ever-shifting quicksands of controversial opinion, which is a very different matter. If the assumption of a major operative risk is justifiable in the hope of relieving suffering or of saving a life, is it then also justifiable in the hope of creating a new life? If not, then just how much risk are we warranted in taking in our efforts to relieve sterility? To be sure the question is much simplified in the presence of marked pathological lesions which in themselves are responsible for a certain degree of ill health or suffering, independent of the co-existing sterility, and which call imperatively for surgical relief. But this is only begging the question, and helps not at all in deciding what is justifiable in the presence of the single uncomplicated symptom of sterility. I can see but one course that is fair and ethical, and that is to leave the ultimate decision to the parties most concerned. The husband and wife must make the final decision.

## FACTORS ENTERING INTO THE DIAGNOSIS OF STERILITY \*

By EDWARD REYNOLDS, M.D., and DONALD MACOMBER, M.D.,  
BOSTON MASS

THE subject of sterility in the female presents such extreme complexities that it is difficult to give an intelligible and comprehensive view of the entire subject in a short space. We shall therefore confine our attention to a discussion of diagnosis in general, and to a consideration of the various examinations involved in making a diagnosis in a given case.

This subject of diagnosis is perhaps the most

important in the whole matter of sterility since it determines the nature of the treatment and the outlook for success which that treatment offers. The actual treatment itself is as a rule not as highly specialized as the methods of diagnosis, and consists for the most part of procedures well recognized in gynecological practice. It is true that certain procedures, notably those used in dealing with ovarian and uterine dysfunctions, require a special technique for their successful employment, but the methods of treat-

\* Read at the Annual Meeting of the Medical Society of the State of New York, at New York City, May 22, 1923

ment are generally well known and require no special elaboration here. Diagnosis, on the other hand, is becoming almost daily more and more intricate and minute. Let us first turn, then, to a consideration of the various methods at our disposal for making such a careful diagnosis.

It should be stated at the outset that diagnosis of the cause, or causes, of a given sterile mating and the examinations by which that diagnosis is to be reached, necessarily involve an investigation of the man as well as of the woman. In this paper we have been requested to treat of the female side only, but in practice it is impossible to separate the two sides in this somewhat arbitrary manner.

While it is proper to speak of the sterility of a marriage, it is rare to find any individual who is completely sterile. Few individuals have not some degree of fertility, their fertility is merely lowered from one cause or another. Individual sterility from gross pathologic lesions does of course exist and must be dealt with, but the sterility of most marriages is caused by decreased fertility in one or both of the individuals concerned. Such lowered fertility is about as often caused by general constitutional conditions as by local disturbances.

As in other departments of medicine any examination should always be preceded by a most careful and painstaking history, and this seems to us of especial importance in cases of sterility. Such a history, in addition to covering all important illnesses and operations, should include a particularly careful investigation of the menstrual and developmental history. The points particularly to be stressed throughout are the general condition of the individual, together with any particular symptoms during the difficult periods of development and early married life. A most thorough cross-examination as to the present condition is also essential. In addition to questions in regard to the proper functioning of all the physiologic systems, the patient should be questioned carefully in regard to nutrition, diet, and exercise. Another important point to be stressed is the sexual history, with particular regard to the adjustment of early married life and the establishment of regularity of habit. In general, an attempt should be made to discover any deviation from the normal of any function, however remote it may seem from the local physiology of the reproductive system. Similarly a most careful physical examination should be made, and should include all of the recognized procedures which bear upon constitutional conditions. This is particularly important because of the effect which focal infections or intoxications may have on the reproductive function. It is probable that such conditions and the

similar effects produced by malnutrition, or faulty posture act first on the health of the body as a whole, and that the local effect upon reproduction is produced secondarily through the blood or the nervous system. However that may be, it is certain that anything which affects the general health may in susceptible individuals markedly impair the "breeding condition." This is well known to animal breeders and has recently been shown experimentally by us in our laboratory studies on the effect of deficient diet on breeding.<sup>1</sup>

There are several other important points which we must note in the general examination in addition to those which we have just suggested and perhaps the most important of these is the effect of anemias of even rather slight degree. It is well known that in the several anemias menstruation may cease altogether but we are rather apt to overlook the effect of lesser degrees upon reproduction since no such extreme effects are produced. It is, however, the very fact of menstruation with its normal periodic loss of blood which makes the consequences of anemias of even mild degree so far reaching.

A second point which is especially worth keeping in mind is the frequent association between slight enlargements of the thyroid and trouble in the ovaries. The relationship between these two glands of internal secretion has never been worked out in any complete manner but it is certain that some relationship does exist. Finally it goes without saying that signs of constitutional disease such as tuberculosis, syphilis or diabetes must always be searched for.

Having completed the taking of the history and the general investigation of all the bodily functions the next step in arriving at a diagnosis is the local pelvic examination. In making this the usual visual and bimanual examinations should be followed by a recto vagino-abdominal palpation which is made with the forefinger in the vagina, the second finger in the rectum, and the other hand on the abdomen. The superior degree in which the shape and relation of the uterine body and the condition of the ovaries are determined by this examination can be appreciated only by those who have trained themselves to it. It is essential to the determination of the existence of spasms in the uterine attachments, a very important item in the examination for sterility, and the functional derangements of the ovaries can hardly be studied successfully in any other way. These examinations should usually be repeated under anesthesia. The use of primary anesthesia by gas-oxygen is so lacking in disturbing or unpleasant features as to be quite unobjectionable.

The examination should always include not

only the usual gynecological search for abnormalities, but a complete review of every part of the genital organs, including size, shape, degree of development, tenderness, congestion, localized inflammatory conditions and spasms, all of which have a direct bearing upon the functional derangements which are all-important in sterility.

Thus far the object in the study of a case has been chiefly the search for conditions either general or local which might interfere with the proper activity of the reproductive function, and it has not developed any methods which might be said to be peculiar to the investigation of sterility. The only emphasis has been upon thoroughness. There are, however, methods which may be said to belong entirely to the realm of sterility, and it is now our purpose to discuss these in somewhat greater detail than we have so far employed.

Our best guide to the functional activity of the generative organs has come from a study of their various secretions both during inactivity of the organs and also as seen after the excitation of coitus, and the evidence so obtained must now be described.

Under normal conditions the secretion of the vagina is small in amount, slightly milky, somewhat granular in appearance, and of moderate acidity. Under the microscope it is seen to consist largely of squamous epithelium and to have growing in it a fairly profuse and usually quite mixed bacterial flora. At the several stages in the menstrual month there are more or less pronounced differences in the character of the desquamation and in the number of leucocytes present. In fact by observing such changes it is sometimes possible in women, as in some animals,<sup>2</sup> to tell at what stage in the menstrual cycle that particular woman happens to be, and this variation must always be allowed for. Under abnormal conditions the amount of secretion may be much increased and the character so altered as to produce a curdy appearance, and the acidity may be greatly increased. When this abnormal secretion is examined microscopically, the flora often consists chiefly of a characteristic bacillus probably identical with that described by Doederlein. It is possible that increased vaginal acidity and the altered character of the secretion may occasionally alone be responsible for the sterility. This is probably a pretty rare condition, however, on account of the frequency during coitus of some degree of uterine suction, which draws spermatozoa immediately within the cervical canal. We believe, however, that the fact of an extreme vaginal acidity is important for another reason, in that it may serve as an index to a profound alteration in the physiology of the whole tract, and

that in practice the cause of this alteration is most frequently found in abnormal conditions of the ovaries, as will be explained a little later.

The secretion from the cervix is small in amount under normal conditions. It is crystal clear, and has about the appearance and consistency of white of egg. Under the microscope only an occasional leucocyte can be seen, and there are no bacteria whatever. After coitus this secretion is normally much increased, so that there should be what amounts to an actual "post-coital flow", but it is never increased normally to a point where spermatozoa are unable to make head against it. There may be various alterations from this normal. One of the most common, which is usually associated with a small external os and an anteversion of the cervix upon the body of the uterus, is due to inadequate drainage. The secretion is thicker and more tenacious than normal and under the microscope is found to contain a much larger number of leucocytes. Chronic congestion may cause changes in this secretion, varying all the way from a condition resembling the post-coital flow to conditions where there has been secondary infection of thick mucus. These infections are usually secondary to congestion, and non-venereal in origin. In primary infections, which are usually venereal in character, but may occasionally be caused by some of the commoner pyogenic organisms, the appearance of the secretion is more nearly that of frank pus, and from this difference they are more apt to spread to the uterus and tubes.

Under normal conditions the secretion from the uterus is slight in amount and watery in character. It is very difficult to obtain this without at least a little trauma, so that the cellular elements, if any are present, are apt to be obscured by the presence of red blood corpuscles. Where there has been chronic congestion or where there have been changes in the uterine mucosa, it is not uncommon to find certain alterations. The most frequent of these is a slightly increased percentage of mucus so that the secretion somewhat resembles that from the cervix. Occasionally where there has been much hypertrophy of the mucosa, a tiny bit is drawn through the eye of the syringe and can readily be recognized under the microscope.

It is certain that the tubes also have a secretion which is subject to alterations, and occasionally it is possible to suspect that such alterations have occurred from the fact that many dead spermatozoa may sometimes be found in a uterine secretion which would otherwise seem to be of normal character, the theory being that secretion draining down from infected tubes has

rendered the otherwise normal uterine secretion sufficiently hostile to have this action.

In the last few years the transuterine insufflation of the tubes which was first advocated by Rubin<sup>2</sup> has given us another and much more reliable way of investigating this part of the genital tract. Much has been written and much still remains to be written about this method and its variations. There can be no doubt that it has certain dangers, but there can also be no doubt that, if employed in suitable cases and with proper precautions, it adds greatly to our ability accurately to diagnose cases of sterility. The technique of that test does not concern us at this time; suffice it to say that the interpretation is not to be taken too literally where the implication is that the tubes are closed or obstructed. It should always be repeated a number of times before a negative conclusion can be drawn with any safety.

Up to this point we have been able to be fairly definite in our statements of the various changes to be found and their significance, but when we come to a consideration of the ovaries, we are less able to attain entire certainty. There are only two common conditions which when found indicate a failure to produce ova, and both are attended by slight but persistent enlargement of the ovaries. The first is the presence of numerous small "retention cysts" in a rounded, tense, and somewhat enlarged ovary, the second the persistence of one or more corpora lutea over a prolonged period. In the latter case also, there is enlargement of the ovary, and on inspection it is impossible to find any of the "scars" which give the normal ovary its distinctive appearance and indicate recent functional activity. It is comparatively simple at operation to decide by palpation and inspection whether a given ovary is functioning or not, but when attempts are made to determine by pre-operative examination the actual conditions present in the ovaries of a given patient, the matter is much more difficult. As was explained when describing the recto vaginal palpation this method offers us the best means of actually palpating the ovaries and estimating their size and consistency. When this method is employed under an anesthetic, it gives us the most reliable information which we can obtain at a single examination. In cases which we are able to see frequently, it is, however, often possible to get further indications as to whether the ovaries are functioning or not by examining before and after the menstrual period for two or three months. Under normal conditions the ovary is practically not to be felt except directly after the period when the fresh corpus formation has caused a very moderate enlargement. If it is found that first one ovary and then the

other is enlarged for a short time after the period, but that the enlargement disappears entirely before the ensuing period, the presumption is that those ovaries are functioning in a normal manner. If, furthermore, the vaginal secretion is not over-acid if there is no demonstrable enlargement of the thyroid, and if the menstruation is normal in amount and regularity, this presumption becomes almost a certainty. If either ovary fails to resume the normal size in the latter half of the inter-menstrual interval, there is a presumption against full ovarian activity, and this is strengthened or weakened by observation of the secretions which accompany it.

So far we have dealt entirely with the examinations of the woman, but it now becomes necessary to sketch in very briefly the methods which are used in examining the man. As with the woman, history and general physical examination are of the utmost importance in determining general condition and the possibility of constitutional disease, or the possible effect of focal infections and other similar conditions. With the man also a most careful local examination should be made to determine any abnormalities. Such an examination will sometimes require the co-operation of a skilled genito-urinary surgeon but it is advisable in diagnosing any case of sterility to make at least a routine examination of the male in order that the value of the findings may be kept in its proper relationship to the picture as a whole. In the examination of the secretions we have, in the male as in the female, another clue to the manner in which these organs are actually performing their work, but in the male we derive a further advantage from examining the secretions in that there we are able to see and study the reproductive cells themselves. This may be accomplished either by obtaining a direct specimen of semen, or by obtaining the secretions of the female after coitus and submitting them to a thorough study in the gross and under the microscope. As we have stated, it is not our province in this paper to discuss in any detail the question of male sterility, but we do wish to emphasize one important point and that is that from our point of view the mere finding of motile spermatozoa in such an examination is in itself no absolute proof of fertility, but that the number, degree of motility, and vitality of the spermatozoa must be estimated and the character and cellular content of the prostatic and vesicular contributions to the semen must be carefully observed.

Having now reviewed the various methods employed in estimating the degree of fertility of the two individuals concerned in a given mating,

it becomes necessary to observe as far as possible what actually happens when they are combined. The method was first suggested by Huhner<sup>4</sup> and, as mentioned above, consists in observing under the microscope what happens to the spermatozoa in the various secretions of the female. In practice sufficient knowledge can be obtained if the examinations are made within the hour after coitus. They should include a study of the seminal pool in the vagina, of specimens taken from various portions of the cervical canal and, if possible, from the uterine cavity. The points to be observed here are again the number of spermatozoa at the various levels, the percentage of them which are alive, and the quality of motion and vitality of those which are not tied up or dead. If a study has not previously been made of the morphology of the spermatozoa themselves, this should now be done with stained smears.

This examination completes the investigations which are necessary in arriving at complete diagnosis of the cause, or causes, of sterility in a given case. It will be seen that a very considerable mass of data has been accumulated by the methods employed, and it now becomes our task to co-ordinate and simplify these facts so that they can be presented to the patient in an intelligent manner. This is particularly necessary for the reason that cases of sterility belong to a different category in practice as compared with cases which involve questions of health, or of danger to life itself, furthermore an accurate prognosis is especially important in sterility, since the institution of treatment, and more especially of operative treatment, in cases in which it is judged appropriate, involves a decision that is different in kind from that which is concerned with the relief of ill health alone.

When an abnormal condition involves a distressing symptomatology, and more especially when it involves danger to life, it is of course proper for the surgeon to urge on his patient the importance of treatment, whether minor or operative, but the institution of treatment, with its discomforts and expenses, for the relief of sterility alone is one which is essentially at the choice of the patients, and which is wholly dependent on the degree of their desire for children in relation to the degree of improvement in their prospects which may be expected from such treatment. Their decision must then be largely dependent on the prognosis that is given to them, and every effort should be made to render it accurate.

There is moreover an additional consideration

which enters into every prognosis and will materially influence any decision which is to be made, and that is that the prognosis of any sterile mating depends on two factors, one is the nature and severity of the causative lesion found in the individual who is responsible for the sterility, and the other is the degree of fertility of the other partner to that mating. The prognosis may not infrequently be much worse where the fertility is only moderately reduced on both sides, than where there is absolute sterility from a remediable cause on one side but with a high degree of fertility on the other.

Having now completed this brief review of the factors entering into making the diagnosis and giving the opinion in a case of sterility, we wish to conclude by emphasizing certain points which we have found to be of the greatest importance. First, no diagnosis can be satisfactory which is not based upon a most thorough and exhaustive study of both of the individuals concerned in the particular mating under consideration, and second, no opinion, or treatment based upon that opinion, can be adequate unless due weight is given to the inter-relationship between these two individuals. In other words—we believe that it has been established<sup>5</sup> that the fertility of any mating may be regarded as the combination of the fertilities of the partners to that mating, and that for that reason it is only this mating fertility as obtained by careful and simultaneous examination of both partners which can be used as the basis for a rational and dependable opinion.

## BESETTING AND OTHER MORBID FEARS \*

By TOM A. WILLIAMS, M.B.C.M.

WASHINGTON D. C.

WHEN an injurious foreign body is introduced into a living creature there is a response calculated to destroy or cast out the intruder or to incarcerate it.

Immunization, abscess discharge, encapsulation represent these processes. In avoiding the injurious some can do even better, for even an amoeba can illustrate the advantages of prevention over cure by escape from the hurtful substance so that it does not enter its body at all. Negative chemiotaxis is the forerunner of fear.

By means of specialized organs known as distance receptors some animals can avoid the objectionable without contact. Nevertheless a physical stimulus is at work, waves of sound or light, even when the more primitive chemical stimulus of smell is not in question.

But in cerebrate animals the problem is much more complex than immediate avoidance of uncomfortable stimuli. Integration of former experiences influences their responses so that primitive instincts are swamped in many relations. For example the primitive desire of the hungry boy to seize the nearest food is kept in leash by the imagining of the distress at being disgraced as a thief. Foresight forestalls many a rape, imagination prevents murder.

Inhibitions of this kind are all reducible to the simplest terms of experimental psychology by means of the famous caged rat. The rat in the cage will not cross the electrified flooring when twelve hours hungry, but may do so when twenty-four hours hungry, or more certainly when the temperature has cooled to 5° centigrade.

In this experiment hours of hunger measure the degree of desire, volts of electricity measure the inhibitory stimulus the chilling of the temperature increases the physiological stimulus (discomfort) to a degree which overbalances the discomfort of the electric shock (dread).

The result may be stated in psychological terms as a change of mental attitude, (desperation) leading to new conduct (recklessness). Politically speaking fear bred by desire for comfort and security (conservatism) becomes enterprise bred of privation and discomfort (radicalism).

In the motivation of the radical rat we may find the interpretation of many a conquest of fear. Historical examples are legion. The assault of the French revolutionists the colonization of New England and of Australia, the em-

gration of the Huguenots are examples in modern history. Biographies of self-made men furnish innumerable examples. More complex are the motivations of some reformers. The abolitionists braved obloquy because of moral discomfort at the realization of slavery. These radical rats endured the shocks of public contempt for the sake of the food of universal human freedom, because of the moral discomforts brought by their imagination of the sufferings of fellow creatures as slaves. The intense dread of the ridicule of his fellows felt by the average prudent man was in the Abolitionists overbalanced by the distresses (grief and shame) induced by Harriet Beecher Stowe, Garrison and like protagonists.

In physiological stimuli even we can find the source of most complex motivations. Fear which is among these is never causeless. It is only obscure because of the multitude of the experiences which go to make up any impulse in a sophisticated human being. The memory of one sensation tends to action in one way but it may be overborne by memory of a different sensation which tends to action in a different way, which different way may be avoidance of action as in the first place, that is, escape. The simple example is the child seeing the bright object, the fire, and wishing to touch it being halted by the memory of having been burnt which compels him to refrain. The child bitten by a dog will run from other dogs. So the young person repeatedly humiliated will avoid social contacts and grow up timid. This will be done without much thinking about it as a kind of habit even though there be no prospect of humiliation just as the rat will eventually learn not to cross the barrier even when there is no electrical charge therein.

The rat, however, can be re educated to learn the harmlessness of the metal plate. And so the human being can be re educated to learn the harmlessness of situations which in childhood he found injurious.

The process of doing this has been called reconditioning, it is the basis of psychotherapy.<sup>1</sup> Getting rid of fear depends upon this process which has its roots in physiological data concerning sensation and summation of stimuli and in psychological data concerning the determinants of emotion and the formation of habits.

Physiological fundamentals however are only the principles for guidance, they are not the means for therapy, these are more complex.

\*Read at the Annual Meeting of the Medical Society of the State of New York at New York City May 23 1923

<sup>1</sup>See William "The Situation Psychology" Southern Medical Association, to appear in their Journal, 1924

psychologically. The whole matter is perhaps best illustrated by an example given at length.

Thus, a collegian of twenty-one, after a violent struggle to accomplish the work at a woman's college, found herself unable to do so, became more and more panic-stricken by her failure, slept worse and worse, and finding an emotional outburst imminent, and in terror of disgracing herself, induced her people to allow her to leave. Rest scarcely improved her, and an attempt to teach school was not successful, although she finished the term. A year later she was sent to me to see if it was expedient for her to return to college.

Psychological examination revealed the real cause of her failure. She was a healthy, muscular girl of excellent stamina and clear mind, and there were only some minor physiological disturbances which were readily dealt with medically—viz., an elevation of pulse and blood pressure, soon falling to normal, and a roughness of skin and excess of fat soon disappearing with treatment. It eventually transpired that she herself attributed her failure to a hereditarily defective nervous system for which there was no remedy, and this seriously alarmed her, as she wished to continue at college in order to please her family.

Psychological investigation, however, soon showed that her life had been a prolonged though intermittent struggle to avoid or combat her various fears, and that the intense emotional stress of relating herself to her fellows in college, particularly when she was placed in a conspicuous place before them, as in reciting, had undermined her strength until she could stand it no longer. This timidity had not been so evident when she attended a Southern high school, where conspicuousness was more avoidable. Nevertheless, even there, when called to the blackboard, a horrible faintness would seize her, and she swooned once in terror during a violin lesson.

As a girl, at home, singing in the choir terrified her and she pleaded very hard without success, to be allowed to leave this conspicuous position, although she did not inform her people of her real reason. Another of her dreads was of an open place. When in the open she felt as though her balance was being lost, and experienced an almost irresistible attraction for the ground and a wish to go on all fours. Her legs weakened, her heart palpitated and she became more and more terrified. She had avoided occasions for being alone, which she also dreaded. Another of her fears was of herself, as she called it. This began in the bath on an occasion when she began to wonder who she was, it was the realization of the ego, as psychologists call it. The detachment of herself in thought from herself in the body caused a terrifying feeling of loneliness. This

is not an infrequent reflection, all through life, and has been expressed by many philosophers, but a child in a bath not used to philosophizing found it a terrifying conception.

As a young child her embarrassment would show itself by a twitching of the eyes. This became a habit which she succeeded in stopping when bribed, although it recurred each spring until she was about seventeen.

These fears had really originated when she was about four years old. One evening, while walking alone, the sudden noise of a street car startled her, so that she ran away, past people she knew who were sitting on their doorstep during the heat of summer. She was so ashamed of her conduct that ever after she dreaded showing fear before others. It was this incident which formed the root from which grew the dread which poisoned her life. At college so great was the girl's terror of living with her dreadful anticipations that she had decided to expose herself to cold in order to contract pneumonia unless she was allowed to leave. Before she was permitted to leave, her terror had reached such a pitch that nearly everything would induce it. At meals she could scarcely swallow, at times she was going about in a kind of daze with a feeling of pressure in the head.

This sensation in the head is a frequent consequence of prolonged anxiety. Physicians once supposed that the patient's complaint was imaginary and that the headache was an excuse to avoid the unpleasant. It was regarded lightly as one of the "inexplicable symptoms of neurasthenics." This opinion, which I could never hold, is fast being abandoned. Sensations of this kind in the head are now not looked upon as different in kind from the sensations which emotional states may produce in any part of the body, more particularly in the chest, abdomen and pelvis. Unfortunately many of these sensations direct the victim's attention to the region where the sensations are felt, and he believes that a physical disease of the organ must be present, and often succeeds in inducing the same belief in the medical man he consults. Even surgical operations have been performed because of symptoms of emotional origin. Pressure is the usual feeling in patients in this state, as in this girl, but in some instances the feeling is one of void.

She had succeeded in her brave struggle until a perusal of a text-book of psychology, in which she naturally turned to the chapter on Fears, informed her that they were "mental" and absolutely beyond her control. This was the finishing touch. This misinformation which, of course, she did not know better than to believe, made her feel like a creature in a dragnet from which she could not escape and therefore she lived in a constant panic.

It is instructive to note that the fear of situations which would make her conspicuous before others was in no way aggravated when there occurred at the age of fifteen that frequent ashamedness of their sex which affects young girls, even although she believed for a while it was wicked. Later on when she once missed menstruation, she feared, in her ignorance, that she must be pregnant. So much for the sexual factor in this girl's neurosis, even though at the age of eleven she did not wish to grow up but wished to remain as a child where the facing of situations was less exigent.<sup>1</sup>

Although the genesis of her apprehensiveness was quickly uncovered, yet it required several interviews to bring home to her the real import of her difficulties. When she realized the import of what we had revealed she still had several objections to offer. For instance, she asked "Why, if the feeling of fear comes only because of fearing it does it come sometimes without thought, and at other times does not come even when thinking about it? Since my thoughts or dread of it seems not directly to affect it, is it not a thing that is fundamental and so will come even though I understand it?"

To this I replied that it depended upon the attitude of mind one adopted towards the particular occasion which aroused fear. Thus, an engineer officer did not fear a barrage, because he took the attitude that to encounter it was part of his duty, whereas he did fear the creaking door when in the house alone because it aroused infantile feelings the cause of which he had dodged instead of meeting logically and courageously. It is a misapprehension to infer that fear of this kind comes without thought. It only seems so because of its rapidity, as in the case of the boy who ran in panic for fear of the wild beast jumping upon his back and who, when he really considered the problem, had to confess, "I guess my imagination gets away with me." On the contrary, fear is aggravated by thinking of it timorously without understanding, superstitiously, whereas when we think of it studiously, in a scientific spirit, with a view to penetrating its meaning and understanding its causes, one would cease to be afraid because one would exorcise the bogey which is always the real cause of fear.

These answers destroying the premises of the question, the conclusion that her fear was fundamental "and will come even when understood" was invalidated.

Another of her doubts was that one might legitimately fear a return of loss of confidence, especially to a person of a melancholy disposition. To this I pointed out that the loss of confidence had specific causes, and the removal of these would prevent the recurrence. Furthermore I

told her that no patient whose fears had been removed by me had ever relapsed in spite of encountering most exacting trials of courage, one of them over a period of many years. She asked if her fear were more fundamental than that of one of the cases I had cited to illustrate the formation of fear, viz. that of a small boy and some lions in a zoo. I replied that it could not be more fundamental than that of a phobic professional man of highly faulty heredity, whose fear was removed in ten days and in whom it had not returned, twelve years later. Reflection upon these data has enabled this young woman to dispose of her fear and she now leads a happy existence.

This case is an illustration not only of the mechanism of long continued fear, but that one of the factors in the development of tic is fear. Had repeated efforts not been made to overcome the twitching of the eyes, the patient would likely have found herself in the hands of an ophthalmologist, because of the spasm of the orbicularis palpebrarum.<sup>2</sup>

This case shows, too, that physical conditions bring forth emotional reactions hitherto latent, the factor in this case being the alteration recurring each spring during the adaptation of the organism to changes of temperature and different habits of living.

On the other hand, the case illustrates that physical sensations (headache) may be the consequence of reactions induced psychologically but through a physical mechanism.

Adaptability to stresses comparatively mild was manifested by this patient who could not adjust herself when severe stresses became unavoidable. Her condition then is an illustration of precipitance by psychological causes.

The final breakdown is a beautiful example of direct induction in a person prepared to reach this culmination by long seepage in conditioned situations. These situations, while apparently extraneous were actually distorted into terrifying ones by the projection of the patient's own interpretations upon them. The trend of thinking which was responsible arose from a single circumstance very early in life, the intense emotion of which had not been rationally dealt with because of shame.

Finally this case, and most of the others discussed in my recently published book, *Dreads and Besetting Fears*, are greatly remediable by appropriate treatment. This treatment is not usually the long-drawn-out affair that some have argued for. Eight visits in the course of two months were sufficient in this case, and in not all of these was psychological work done. Many patients have gained capacity for adaptation within a week, such as the claustrophobic on

<sup>1</sup> See my discussion, *Some Neglected Psychopathic Factors*, *Jr. A. M. A.* 1922, October 6th.

<sup>2</sup> See my paper "Diplopia," *Jr. A. M. A.* 1923, October 22nd.  
<sup>3</sup> The methods of dealing with besetting fears are discussed in the above-mentioned book.

page 74 of the book, and such as the case of fear of storms in a business man, which actually was a fear of death and was traced to its origin in a particular incident acting upon an only child whose self-love was hypertrophic

In very few cases, and in none of the above, was the mere analysis sufficient to readjust the patient. In all, constructive psychological work had to be accomplished. The business man only became comfortable when he came to realize that he "didn't amount to much anyhow." The claustrophobic ceased to fear assemblies only when with much difficulty she had completely reconstructed her mental attitude towards the violent physical reactions which her dread created, and which she could scarcely persuade herself originated psychologically. The collegian required the transformation of her belief that she was fated by heredity to be a pitiable coward.

*The Sense of Inferiority*—The fear of situations where one has to adapt oneself to the wishes and desires of others is due to a feeling of inadequacy to these situations. It was described at great length by Pierre Janet, after the study of about three hundred patients, under the name of "sentiments d'incompletude," as one of the manifestations of a general state of lowered psychological tension, as he called it. He termed the patients "psychasthenics," and in his great book, "Les Obsessions et Les Psychasthenics," he has given us the most complete analysis of the state

of these distressed persons. However, he has failed to penetrate very deeply into the genesis of these patients' symptoms and is often content to incriminate heredity without ascertaining the determinative sources of the patient's difficulties.

It is quite true that chemical irregularities will render more sensitive the organs which receive the kind of impressions which arouse emotion. Individuals intoxicated by alcohol are easily terror-stricken. Persons poisoned by infectious disease are inclined to be timorous also. Maniacal persons are most susceptible to terror-bringing incidents. However, in none of these kinds of fear is it profitable to deal psychologically with the fear itself. In all of them the fears will cease when the physical disturbances have subsided, unless the patient's mind has dwelt for a long time upon a single fear, which is very apt to be one concerning disease. In that case the habit of thought which continues the fear must be dealt with psychologically, just as is exemplified in the case of the collegian above.

*The Principles to be Utilized in Dispelling Fear*—A study of the above case illustrates the need of discovering the mechanism by which fear affects a patient. By understanding this the patient frees himself of what to him is a mystery. Strictly speaking, it is only the unknown which is terrible. Sailors do not fear storms as they do portents. The bravest soldier may be terrified by a cat. A woman terrified by a harmless cow will cross the most dangerous street unmoved.

## OBSERVATIONS REGARDING BRAIN ABSCESS OF OTITIC ORIGIN \*

By WILLIAM SHARPE, M.D.

NEW YORK CITY

**I**N the diagnosis and treatment of brain abscess it should always be remembered that of all intracranial surgical conditions, this subcortical lesion is possibly the most difficult of diagnosis and of accurate localization, and that, therefore, its treatment being a surgical one, the operation of drainage is usually performed as an exploratory procedure. The chief difficulties of diagnosis are due to the usual situation of the abscess in the temporosphenoidal lobe (a comparatively silent area of the cerebral hemisphere) or in either lobe of the cerebellum where its presence is clinically demonstrated late in the development of the process, also the associated mental sluggishness usually lessens the patient's essential co-operation in the neurological examinations, and these factors, together with the rather frequent latency or even non-appearance of the typical

symptoms and signs of a subcortical lesion, permit the formation of an extensive brain abscess, therefore, in this series of patients having a brain abscess, as in those having a brain tumor formation, the tentative diagnosis of the condition is that of a large lesion and rarely, if ever, of a small one, that is, the condition is rarely diagnosed and localized to the degree of warranting an intradural operation until the late symptoms and signs resulting from the increasing size of the abscess or tumor formation make the prognosis of even life itself a most doubtful one. The operative treatment of brain abscess, therefore, is utilized at present as a last resort, being comparable with the operative treatment of brain tumors of several years ago, when it was rare for such patients to be operated upon unless all of the cardinal symptoms and signs of brain tumor were present—headache, vomiting, paralyses, etc., and, most unfortunately, visual impairment even to the

\* Read at the Annual Meeting of the Medical Society of the State of New York, at New York City May 22, 1923

degree of blindness. In these tumor cases of the past decade, both the difficulty of diagnosis and the high operative mortality-rate, in addition to the frequent cerebral trauma of the osteoplastic craniotomy operation, made the operative treatment a procedure of last resort and it was only after the subtemporal decompression, as devised by Doctor Cushing became recognized not only as a means of lowering the increased intracranial pressure and thereby preserving the vision, but also as an excellent method of exploration of the entire adjacent cerebral hemisphere, that the early diagnosis and the early treatment of brain tumor were even attempted. During the past ten years the more accurate diagnosis and the improved surgical technique have permitted a marked advance in the operative treatment of brain tumor and it is with this progress in mind that the writer desires to record several observations in the early diagnosis and treatment of brain abscess.

In the first place, a brain abscess is only a brain abscess when situated within or beneath the cortex, merely a subdural, but supracortical collection of pus is not a brain abscess and it has been the neglect of this differentiation that has permitted the statistics in the literature of so-called "brain abscess" to be very confusing, and especially is this true in regard to the operative mortality. A number of surgeons have reported an operative mortality of less than 50 per cent in the treatment of brain abscess and yet, in the analysis of many of their cases, the mere escape of pus in varying amount through the incision of the dura presenting in the mastoid exposure was considered as the drainage of a brain abscess, such subdural collections of pus are relatively common in conditions of localized suppurative meningitis of otitic origin—and fortunately, usually well walled-off from the subdural and subarachnoid spaces and thus a simple dural drainage frequently permits an excellent recovery of life naturally the mortality-rate of these so-called "brain abscesses" is low but a true brain abscess situated in or beneath the cortex of the brain is not in my opinion successfully treated at present with such a low mortality rate. In this series of 27 patients having a true brain abscess the mortality has been 17 that is, 62 plus per cent (In 1914 at the meeting of the American Laryngological, Rhinological and Otological Society, I reported a mortality-rate of 40 per cent but the series of patients was a small one and included several brain abscesses following infected fractures of the vault—a condition more amenable to successful operative drainage.)

If an intracranial subdural purulent lesion is suspected as a complication of otitic disease and

especially following the mastoid operation, then in early examination of the cerebrospinal fluid at lumbar puncture is frequently of much assistance in differentiating a localized meningeal process with its increased cell count<sup>1</sup> and the varying signs of meningeal irritation from the early condition of true brain abscess with only minor changes, if any, in the cerebrospinal fluid—the diagnosis being based more upon the general neurological signs, an ophthalmoscopic examination rarely discloses a marked increase of the intracranial pressure unless the abscess is a large subtentorial one to the degree of causing a partial blockage of the aqueduct and therefore of the ventricles. Any operative treatment of suspected brain abscess of otitic origin naturally presupposes the thorough removal of the focus of infection usually in the mastoid, and a careful examination of the cerebellar dura both in front and behind the sinus, and also of the cerebellar dura covering the roof of the middle ear, antrum and mastoid cavity. If there is concrete evidence of a subdural collection of pus in any area of the exposed dura especially in the presence of a purulent dural sinus or if a diseased portion of the dura is definitely adherent to the adjacent cerebral or cerebellar cortex, with and even without demonstrable neurologic signs indicative of a subcortical lesion, then it is, in my opinion, a rational procedure and a justifiable one to make a small opening in this area of the dura and to insert a blunt puncture needle into the contiguous cortex in the hope that the abscess formation may thus be located and satisfactorily drained, that is, the dura being adherent to the cortex the subdural and subarachnoid spaces are thus walled off and the danger of producing a spreading purulent meningitis by the operative procedure itself is therefore lessened whether the brain abscess is located or not. To ascertain whether the dura is adherent to the underlying cerebral or cerebellar cortex a small dural hook may be inserted into the outer layer of the dura which can be gently raised if there is no adhesion present. But it is a distinctly unsurgical procedure in my opinion, to puncture with a knife or a sharp exploring needle a portion of the exposed dura in the infected field of the mastoid and into the adjacent cerebral or cerebellar cortex without first opening the dura carefully to ascertain the presence or not of an underlying supracortical vessel and of even greater importance without knowing whether the infected dura is adherent to the adjacent cortex or not if it is adherent and well walled-off from the subdural and subarachnoid spaces, then if the suspected abscess is not found there is only the danger of causing a brain abscess to form at the site of the cortical puncture due to the passage of the exploring needle through

<sup>1</sup> *The Laryngoscope*, March 1914. "The Diagnosis and Treatment of Brain Abscess."

<sup>2</sup> *The Laryngoscope*, July 1920. "Brain Abscess Complicating a Local Cranial Infection."

the infected field of the mastoid and the infected area of the adherent dura, but if the dura is not adherent and the suspected brain abscess is not located, then there is also the great danger of a purulent meningitis resulting from the exploratory puncture or punctures through the infected field of the mastoid—no matter how careful the surgeon may be in attempting to sterilize the operative field with iodine and other antiseptics, this relative asepsis may be possible at the time of the puncture, but surely not later in the presence of an infective process

Inasmuch as the operative procedure of drainage of brain abscess is an exploratory one, it does seem more rational not to attempt the drainage through the infected field of the mastoid unless as stated above, there is unmistakable evidence of its presence adjacent to the exposed otitic dura. If, on the contrary, a careful examination of the exposed dura of the mastoid does not reveal definite evidence of a contiguous subdural and cortical purulent lesion, then instead of opening into the subdural space through the infected field of the mastoid in search of the abscess, it would appear to be a safer and a more surgical procedure to perform, through the clean subtemporal area, an exploration of the suspected temporosphenoidal lobe or through the clean suboccipital area if the adjacent lobe of the cerebellum should be the suspected site of the abscess. Then, if the abscess is found, it can be well drained through this exploratory clean incision, but if the abscess is not located (and unfortunately this does occur), then the patient has been subjected to little or no risk of a purulent meningitis, and at least a decompression has been performed in the hope that the abscess, if present, will localize itself later. This method of operative approach in selected cases of suspected brain abscess was first advocated in my paper of 1914 and it is still hoped that this comparatively safe method of exploration will permit an earlier drainage of the abscess formation than has been afforded by the great danger of any intradural exploratory procedure through the infected field of the mastoid—the extreme risk of such an exploration being well recognized and therefore usually postponed until it may be considered as a last resort—the so-called “giving the patient a chance”

In regard to the early drainage of brain abscess, the opinion has been expressed that it might be advisable to wait in these cases until there has formed a definite limiting membrane or sac walling off the abscess formation and then the operative drainage would entail less risk of a spreading purulent meningo-encephalitis. If this attitude is correct, then no doubt I was most fortunate in this series of brain abscess cases the operative and post-mortem findings in all but three of them were abscess formations of varying size and well walled-off by membranous sacs of even one-eighth

of an inch in thickness, whereas in only one case of the ten patients recovering from the operative drainage did the blunt puncture needle encounter the firm resistance of a sac-wall upon entering the abscess cavity, I am therefore of the opinion that the mortality is lessened by the early drainage of the abscess formation as an acute brain abscess than it is later, when a thick sac-membrane has formed, besides, in these chronic cases well walled-off by a thick limiting membrane, even though the abscess is drained at the time of the operation, yet there is left a tough pyogenic membrane which may not collapse and, in spite of free drainage, the purulent discharge may continue until a purulent meningo-encephalitis results from infection, either from the pathway of drainage of the abscess itself or from without the skull. It must also be remembered that the abscess formation is rarely diagnosed sufficiently early to warrant an exploratory operation, and especially through the mastoid area, before a self-limiting membrane has formed, so that a too early drainage operation of the abscess formation need only be feared theoretically, at least, in the present status of diagnostic methods. As in every surgical condition affecting the central nervous system and especially is it true of tumor formations, it has been the *delayed* diagnosis and the *late* operation that have prevented a larger percentage of recoveries—both of life and of future normality. To wait until the abscess is so enlarged that it may rupture into the subdural and sub-arachnoid spaces or even into the ventricles is indeed a risk.

Technically, the operative method of drainage most satisfactory in this series of patients has been the double glass tubes, one within the other, and with end and lateral openings, so that the outer tube can be firmly secured to the scalp by adhesive plaster and always left *in situ*, whereas the inner tube can be removed at the daily dressings and used as a means of suction, in this manner, there is no danger of “losing” the site of the abscess or of the drainage tubes becoming blocked. However, any method of drainage which the surgeon knows and can use successfully, would undoubtedly give to that surgeon the best results. As an added precaution against the risk of a purulent meningitis occurring at the site of the operative drainage in the clean subtemporal or occipital area, it is advisable in selected patients who are not *in extremis* (and unfortunately at present, it is the rare patient having a brain abscess who is not *in extremis* before a definite diagnosis permits an exploratory intradural operation), to perform the operation in *two* stages—merely removing the bone, opening the dura, and pricking the arachnoid with a small needle in several places over a circular area of 1 cm in diameter at the first operation, and then one or two days later, when these ex-

posed subdural and subarachnoid spaces have become adherent to the overlying dura and well walled-off from the surrounding field, to perform the cortical exploratory puncture through this protected area in search of the abscess, in this manner, if the abscess is successfully located, the subsequent risk of a localized purulent meningitis becoming a diffuse process is lessened. This ideal method of cortical drainage is only possible in those fortunate patients not in *extremis* before the diagnosis of brain abscess is more than suspected—all but three of the patients in this series of cases having been drained in the one stage operation in the hope that impending death could be avoided.

In conclusion Brain abscess is a more common complication and cause of death in otitic disease, both of the acute and chronic types than is usually believed, routine autopsies following sudden death of patients having otitic disease will frequently reveal these subcortical lesions as latent and only suspected processes. The mortality of true brain abscess is apparently 100% without operation and over 50% with operative drainage—at least in this series of cases. Rarely is the diagnosis of brain abscess so positive that the operative intradural procedure is more than an exploratory one if the dura presenting in the otitic field indicates the pathway of the intradural lesion, then this route of operative drainage is ideal, if, however, the otitic dura is negative, then the life of the patient should not be risked by a prolonged period of waiting before the adjacent cerebral or cerebellar lobes are explored through the clean subtemporal or suboccipital areas respectively. The earlier the abscess formation is suspected, diagnosed, and if possible accurately located and then well drained, the lower will be the mortality rate.

#### Discussion

Dr. J. MORISSETT SMITH, New York City  
My views of otitic brain abscess are so thoroughly in accord with those expressed by Dr. Sharpe that I can only emphasize some of the excellent points he has made. It is generally agreed that early exploration and drainage is the ideal procedure where there is an abscess present, and while it is possible to have an infection exist over a long period of time with few if any demonstrable symptoms, still it is a fact that there are symptoms in the majority of cases which, if recognized, make it possible to institute drainage before a diffuse meningitis or encephalitis occurs. The true subcortical lesions are far more difficult than the simple subdural collections of pus. The acute brain infection or the abscess following acute mastoid infections are more amenable to drainage than the chronic abscess, the reason being that in an old infection there is usually a thick pyogenic membrane situated beneath the brain cortex. In the past there has been great

hesitancy in performing any operative procedure which necessitated surgical invasion of the brain, and where this was done an ensuing meningitis was not an unexpected complication. The advance in this particular phase of brain surgery in the last few years makes it possible to explore for an abscess through a sterile field and if nothing is found few if any secondary infections occur as a direct result of the exploration. This in itself should be responsible for a general reduction in the mortality in these cases.

I wish to strongly endorse the procedure advocated by Dr. Sharpe in the presence of a suspected abscess. A thorough mastoidectomy should be done with an exposure and inspection of the dura both in the middle and posterior fossa. In the event of a sinus leading through the dura into the bone, drainage should be carefully instituted through this sinus. Since nature has already thrown protecting adhesions around it. If the findings are negative, any subdural exploration should be conducted through a sterile subtemporal or suboccipital decompression. Sufficient stress has not been laid upon this point. It means that an early exploration can be done on suspected cases, and if nothing is found, the patient, if not benefitted by the decompression, is at least none the worse as the result of the exploration. A cerebellar abscess occurring under my supervision a few months back well illustrates this point—

Male, 19, chronic otorrhea since infancy. Foul smelling discharge with subperiosteal swelling. Radical operation revealed sclerosed bone, cholesteatoma, with a small sinus extending from the antrum back through bone to cerebellar dura. There was a large collection of foul-smelling pus covering sinus and dura from above knee to the bulb. A large exposure was made and the usual dressing applied. Normal progress for ten days, then patient began to appear ill, with slight headache and insomnia. Although a cerebellar abscess was suspected, careful examination failed to reveal symptoms warranting an exploration. Observation was continued, and operation was decided upon with the first elevation of temperature or other untoward symptom. Three days later, at five o'clock in the morning, the temperature suddenly jumped to 104.8° and two hours later death resulted.

A closer co-operation between the otologist, the neurological surgeon, and the neurologist would improve our present symptom complex, especially in the earlier manifestations. We have been too lax in obtaining post mortems in the past. This is especially true of the ear men. A concerted effort should be made to secure signed permission for such examinations prior to operation and in this way it would be possible to secure an accurate record of the pathology in all fatal cases.

## CHAIRMAN'S ADDRESS.\*

By ELIAS H BARTLEY, M.D., CHAIRMAN, SECTION ON PEDIATRICS.

BROOKLYN, N Y

THIS section of the State Society has been in existence for eleven years. It was organized in 1912. When it was proposed to organize such a section, there was doubt expressed by some members of the council as to whether there were enough members of the society especially interested in pediatrics to maintain it, or to warrant its establishment. Some discussion has arisen even in recent years as to the wisdom of its continuance. It must be admitted that the attendance at some of the meetings has not been as large as one would expect from the number of physicians in the State especially interested in pediatrics. The character of many of the papers presented, it has been claimed, has not been of the highest order of scientific merit. It might be profitable to inquire, if this is a fact, why it is so. While I do not propose to go into an extended discussion of this matter at this time, it was a matter of surprise to your chairman that there were but two papers of the program of this session which were volunteered. A third was offered after the program was published. Papers prepared in response to personal solicitation, as a rule, are not prepared as the result of original observations or investigations. They are rather papers prepared in response to the request of the chairman or secretary and with a sense of duty or friendship for these officers. I do not know whether this is the practice in the other sections, but I suspect it is. I am told that the constitutional provision that all papers presented to the society or any of its sections are the property of the society, and must be published some time in its journal, has a great influence. An author who has carried on some worth-while investigation on a subject in one of the specialties, prefers to have it appear promptly and in a special journal of his choice, instead of having it appear in a general medical journal of a somewhat local circulation.

This fact is undoubtedly one reason why the reports of original work are not offered to this and other special sections of the State Society, rather than to other special societies which allow the author to dispose of the paper as he may decide. Nor can one find fault with the author for such disposition of it as will add not to his credit or reputation. I am aware of the fact that we have a by-law which permits the council to give an author permission to publish his paper before its appearance in the journal, but this permission has been steadily refused. Simul-

taneous publication is allowed, but can seldom be arranged. I do not wish to be understood as criticizing the above rule of the State Society, which is perhaps absolutely necessary to the existence of its journal, but I am merely discussing conditions affecting the program of this section. Original papers of the character above referred to, are not the only field of this section. We need, quite as much, discussions of practical or applied matters. Pediatrics, as we understand, is not merely the investigation of diseases of children. It is much more. It includes the care of the child from the time of its birth until it is a man or woman. It includes the supervision of its health, its habits, its nutrition, development, and preparation for good citizenship. It includes all that we understand by Child Welfare, prevention or protection from, as well as cure of, its diseases. The practice of pediatrics in the past has been too much limited to the study and treatment of the diseases of children, leaving preventive pediatrics to lay organizations. The time has come when we must keep up with the procession and take our part in the discussion of real preventive medicine among children. It seems to your chairman that it would be within the legitimate province of this section to interest itself in some concrete effort in this direction on the same lines as those adopted by the Brooklyn Pediatric Society for the last two years. Take for example the subject of the prevention of heart disease, which causes more deaths in this city than tuberculosis and cancer combined. I think it will be admitted that very many of the organic heart diseases which are causing so many deaths, and so many disabled victims among children and adults, originate in childhood. This subject has in quite recent years engaged the attention of some pediatricians, and special Heart Clinics have been organized and are doing excellent work, especially in the management and care of children suffering with heart disease. The prophylaxis of heart disease is, however, a different problem. To be effectual this must begin in childhood, and should be the concern of the pediatrician. The first and most essential step is to awaken in the medical profession, especially those working chiefly with children, special interest in the subject and get their co-operation. For several years there has been in existence in this city an "Association for the Prevention and Relief of Heart Disease." Much work has been done by this Association, but it has done little to impress the general medical profession of the City or the State of New York with the immense im-

\* Read at the Annual Meeting of the Medical Society of the State of New York at New York City, May 23, 1923

portance of this matter. Until the profession is generally aroused on the subject, the public cannot be expected to react to propaganda. Perhaps this section could co-operate with them in securing this interest in its members and of the profession of the State. Other lines of activity will occur to many of you. It seems to your chairman that the usefulness and general interest in the section will be increased by some

such program of intensive effort along the lines of preventive pediatrics. If others agree with him, a committee might be appointed to carefully consider the suggestion and report on a well-worked-out plan at our next annual meeting.

These few remarks are presented solely in the interest of the welfare of this body, and with the hope that they may stimulate in others a greater interest in its work.

## ACIDOSIS, A FAULTY DIAGNOSIS \*

By DEWITT H. SHERMAN, M.D., and HARRY R. LOHNES, M.D.

BUFFALO, N. Y.

THE diagnosis "Acidosis," implying a distinct and definite disease, has become so common that we wish to present a strong protest against the careless use of this term by the medical profession.

The physician states that a child is suffering from acidosis, and the layman, knowing nothing more about such a term than that it is new, or guessing that it in some way refers to an excess of uric acid, accepts the term not only as a correct diagnosis but also as one indicating a separate disease—a disease as distinctive as measles or diabetes.

We contend that the term "Acidosis" means merely a set of symptoms, and only a set of symptoms and rarely more, and that it fails to designate the basic factors that may be the cause of this set of symptoms.

There are symptoms which have been named acidosis because of the presence of some signs or symptoms such as high urinary acidity, acetone on the breath, acetone and diacetic acid in the urine, air hunger, persistent vomiting, stupor, and many other signs or symptoms usually enumerated under the heading of "Acidosis." They are symptoms, it may be properly so named, but the term "Acidosis" designates a state, not a disease, just as fever indicates a state and not a disease, or just as coma indicates a state and not a disease.

If there is no such definite disease as "Acidosis," what do the symptoms of that state generally mean? They usually mean that the symptoms can be accounted for by some basic causes if we search hard enough and intelligently enough.

Recently in the New York Academy of Medicine, in a symposium on "Acidosis," Dr. J. H. Means of Boston classified acidosis as either (a) Metabolic, (b) Alimentary, or (c) Retentive. As an example of the metabolic he cited diabetes. As an example of the alimentary form

he cited the ingestion of acids—mineral acids and formic acid in methyl alcohol poisoning. As an example of the retentive form he cited the end stages of nephritis.

We feel this classification should be enlarged or at least amplified, so far as children are concerned, and that two other causes should be included amongst those given, or possibly added to his three groups, since they do not satisfactorily belong to any of these groups. These two causes are 1, infection, 2, intoxications. Possibly our group of infections may belong in his group (a), metabolic, and our group of intoxications may belong in his group (b), alimentary.

Our group No. 1 includes any infection severe enough to disturb the child, such as an infection of the adenoids or as an infection like scarlet fever.

Our group No. 2 refers to poisonous substances generated in the alimentary canal from some definite cause, chemical or anatomical one or both, generally both. They set up a chain of symptoms which soon comprise those often described as "Acidosis."

In our experience one of the commonest causes of so-called acidosis in children is an infection, and if we search hard enough, we will very often find that the symptoms of acidosis are not infrequently associated with involvement of the naso-pharynx. The symptoms of this infection may be slight, merely a stuffiness of the nose, or an indescribable sore throat without much evidence of a real tonsillitis. There may be only a slight reddening of the visible mucous membranes of the pharynx, or a slight sensitiveness and possible swelling of some of the cervical glands, sometimes only a hyperemia of a tympanum.

We treat the condition as we meet it during an attack, but as soon as the patient's condition permits we remove the adenoids, possibly the tonsils also, and the attacks of "Acidosis" cease. This susceptibility to infection occurs at all ages.

\*Read at the Annual Meeting of the Medical Society of the State of New York at New York City May 23 1923.

This kind of case, and a permanently good result, we have seen so many times that our first point of suspicion, when these symptoms appear, is always the naso-pharynx.

Another extremely common cause to explain the frequent so-called "bilious attacks" with its symptoms of acidosis, and sometimes called cyclic vomiting, is *enteroptosis*, or elongated tortuous sigmoid. This occurs in the older children of four to eight years of age, and can generally be promptly relieved. As Talbot and others have told us, "Correct the malposition of the body with or without proper support of the abdominal organs, and the bilious, or acidosis, attacks cease."

Here we may have had an infection, gastro-intestinal or elsewhere, but we more commonly have had toxic chemical substances formed in the intestinal canal from fermentation or putrefaction, which, because retained due to the enteroptosis or tortuous colon, start the illness that leads to the so-called acidosis. Of this class of cases I have a dozen or more children, who at one time in their lives have suffered attacks with acidosis symptoms, some severe enough to be almost convulsive, and who have been permanently relieved by correcting the enteroptosis.

Foreign proteids, which are toxic to certain children, produce the same symptoms. Among these egg-white stands out most prominently, and we are appreciating more and more almost every day that there are a great many children who are mildly sensitized to foreign proteids of one kind or another. By removing the exciting cause through dietetic change, the attacks of so-called acidosis subside.

Some cases of so-called cyclic vomiting, or acidosis, have been dramatically cured by relieving eye-strain. Here the eye-strain interfered with normal digestion, allowing toxic products to be formed and to be absorbed.

I will relate one case of a child who died recently at Harrington Hospital with many of the characteristic symptoms of "Acidosis." It was treated heroically for that supposed condition, but died.

The patient, Adam S., was four years old and entered the hospital October 24th, 1922, with a diagnosis of spastic paralysis. On October 25th, at 10 A M., the child was operated upon by Dr. LeBreton, who made a section of both obturator nerves. Because of the unusual position of the obturator nerves the operation was a prolonged one, the child being under ether anaesthesia for over an hour.

The patient did well for twenty-four hours, but on October 26th it vomited a large amount of greenish fluid. The vomiting persisted all that day and the child complained greatly of thirst. The case history notes report "Chvostek's" sign, carpo-pedal spasm and laryngeal stridor, and that the condition resembles "Acidosis."

On the next day, October 27th, the child had a general convulsion, and became unconscious, with pupils equal but sluggish to light. There was no rigidity, but the patella reflexes were exaggerated. The temperature rose to 102 to 104, the pulse climbing to 160, with respirations at 40. The physical examination, as regards chest and abdomen, was negative. The pharynx was markedly reddened, and the tympana were negative.

The laboratory reported a urine of high acidity with the marked presence of acetone and diacetic acid, but otherwise normal. The spinal fluid showed increased pressure but was otherwise negative. The blood chemistry revealed the carbon dioxide as 13 millimeters which on the next day rose to 23 millimeters. The Wassermann was negative. All the findings resulted in a laboratory diagnosis of undoubted acidosis.

On the following day, October 28th, the child's general condition seemed somewhat improved, and a search for the cause of the symptoms, especially the fever, revealed a suggestion of a commencing lung involvement because of an impaired percussion note and diminished breathing at the base of the right lung. But this lung condition not only failed to materialize but on the next day, October 29th, had disappeared.

On this day the child's condition became worse. It could not be aroused and suffered from convulsive twitchings. On October 30th, five days after the operation, it died at 1 A M.

Had the anaesthetic been chloroform rather than ether, we could have more readily accepted the laboratory diagnosis of "Acidosis." The post-mortem showed old interstitial encephalitis, but nothing else microscopically unusual. But the cultures of the spleen showed an intense non-haemolytic streptococcus infection. The infection had probably come from the reddened throat.

The autopsy report was as follows:

**Pathologic Diagnosis** Recurring tonsillitis and peritonsillitis on both sides (swollen ragged tonsils showing scars on cut surface and thickened tonsillar beds). Acute bilateral cervical lymphadenitis of the superficial and deep lymph nodes.

Two fresh sutured wounds, one on each thigh in the region of the obturator nerve (after operation for spastic paraplegia).

Acute swelling of the spleen.

Marked degeneration of the heart muscle, two fresh vegetations on the aortic cusp of the mitral valve (acute endocarditis). High-grade degeneration and slight icterus of the liver with some atrophy. Oedema and acute congestion of the lungs, oedema of the brain.

Acute sero-fibrinous peritonitis and pleuritis on the right side.

Atrophy of the frontal zones of the brain.

(symmetrical), and numerous foci of circumscribed atrophy, one focus (one half-dollar size) of chronic leptomenigitis on the right parietal zone, chronic hydrocephalus, especially of the right lateral ventricle, hypoplasia of the left basal ganglia

Chief diagnosis, septicæmia. Culture from spleen, a profuse growth streptococcus, non-hæmolytic

But the bacteriological report was the final factor which excluded a diagnosis of acidosis, and made certain the diagnosis of streptococcus infection

In diabetes we have symptoms of acidosis, as for example, diabetic coma. Here we have an intoxication from a chemical toxic substance which produces the symptoms. But "Acidosis" is not justifiably the name given to the disease.

In the symposium mentioned above Henry Rawle Geyelin stated that the symptoms or condition of acidosis may be produced by a too high fat intake, too high both relatively and absolute. This dietetic error may undoubtedly exist and the reduction in the diet of the too high fat intake can undoubtedly be a factor in preventing the condition. But, on the other hand, how important are simple dietetic regulations or restrictions in removing the cause or preventing a recurrence? When the condition arises from infections or from poisons formed as in enteroptosis, or from nervous indigestion due to eyestrain, there will be some advantage in prescribing a normal or rational ratio of food elements, and thereby removing a contributing cause, but if the diet is restricted enough to prevent the child's regular gain in weight, possibly so greatly restricted that it may lose in weight, are we not by this restriction possibly producing a physical depression sufficient to make a child all the more susceptible to infections or intoxications? More than once we have seen this misdirected dietetic limitation cause harm.

We feel now that amongst careful thinkers

the diagnosis of "Acidosis" as an entity is being very generally discarded. We feel that there are a few cases, and they are remarkably few in number, in which a more accurate diagnosis cannot be made with our present knowledge, but we do feel that the diagnosis "Acidosis" as an entity is unjustifiably made in too many cases. We bring this subject up to arouse more interest in the necessity of making a good proper and accurate diagnosis. If this is done, the diagnosis of "Acidosis" as a disease will become exceedingly rare, and will be eliminated from our diagnostic entities.

Summary. Acidosis is a name that should be used to designate a set of symptoms and not a disease entity.

Acidosis is due to some distinct definite cause which can usually be found.

The restriction of the diet by lowering the proteins as well as the fats may be distinctly harmful because, through malnutrition, it may decrease the child's immunity to infections or lower its resistance to intoxications.

#### Discussion

DR. T. WOOD CLARKE, Utica. Acidosis is a symptom little understood. It is really a symptom of starvation owing to too rapid burning of the body fat.

The treatment by starving the vomiting child who has acidosis is fatal, for it increases the condition. Acidosis cases should be fed as quickly as possible, even if they are vomiting, for there may be kept down part of the food, and this helps to stop the acidosis. They should be fed by mouth, by rectum and subcutaneously.

DR. WILLIAM H. DONNELLY, Brooklyn. Most of the cases of the acidosis I have seen have been either due to food sensitization or to enteroptosis. Enteroptosis in children is very much more common than is usually supposed. The X-ray has been of great service in the diagnosis of this condition.

---

#### Deaths

FERGUSON, WILLIAM, New Rochelle, McGill University, 1894, Member State Society, Assistant Surgeon New York Eye and Ear Infirmary, Rhinologist House of Refuge. Died February 2, 1924.

HENNA, J. JULIO, New York City, College of Physicians and Surgeons of New York, 1872, Fellow American Medical Association, New York Academy of Medicine, Member State Society, Consulting Physician French Hospitals. Died January 28, 1924.

PETTIT, ROBERT W. Patchogue, College of Physicians and Surgeons of New York, 1905, Fellow American Medical Association, American Medical Society of Vienna, Member State Society. Died January 8, 1924.

WUEST, CHARLES, Brooklyn, College of Physicians and Surgeons of New York, 1887, Member State Society, Assistant Medical Examiner of Kings County, Visiting Physician Wyckoff Heights and St. Catharine's Hospitals. Died January 28, 1924.

### OFFICERS

*President*—Orvin S. Wightman, M.D. New York  
*Vice President*—Charles O. Boswell, M.D. Rochester  
*Speaker*—E. Eliot Harris, M.D. New York  
*Vice Speaker*—George M. Fisher, M.D. Utica  
*Secretary*—Edward Livingston Hunt, M.D. New York  
*Asst. Secretary*—Wilbur Ward, M.D. New York  
*Treasurer*—Seith M. Milliken, M.D. New York  
*Asst. Treasurer*—Charles Gordon Heyd, M.D. New York

### CHAIRMEN, STANDING COMMITTEES

*Public Health and Medical Education*—Joshua M. Van Cott, M.D. Brooklyn  
*Scientific Work*—Andrew MacFarlane, M.D. Albany  
*Arrangements*—Owen E. Jones, M.D. Rochester  
*Medical Economics*—Henry Lyle Winter, M.D. Cornwall  
*Legislation*—James N. Vander Veer, M.D. Albany  
*Medical Research*—William H. Park, M.D. New York

### COUNCIL

The above officers (with the exception of the Assistant Secretary and Assistant Treasurer), the ex-President and the Councilors of the District Branches  
*First District*—Edward C. Rushmore, M.D. Tuxedo Park  
*Second District*—Frank H. Lasher, M.D. Brooklyn  
*Third District*—Arthur J. Bedell, M.D. Albany  
*Fourth District*—Charles C. Trembley, M.D. Saranac Lake  
*Fifth District*—Walter H. Kidder, M.D. Oswego  
*Sixth District*—John M. Quirk, M.D. Watkins  
*Seventh District*—Ethan A. Nevin, M.D. Newark  
*Eighth District*—Harry R. Trick, M.D. Buffalo

### COUNSEL

GEORGE W. WHITESIDE, Esq., 27 William St. New York

### ATTORNEY

ROBERT OLIVER, Esq., 27 William St. New York  
Telephone, Broad 1744

### SECTION OFFICERS

*Medicine*  
*Chairman*—CLAYTON W. GREENE, M.D. Buffalo  
*Secretary*—ROBERT L. LEVY, M.D. New York  
*Surgery*  
*Chairman*, EMIL GOETSCH, M.D. Brooklyn  
*Secretary*—MARSHALL CLINTON, M.D. Buffalo  
*Obstetrics and Gynecology*  
*Chairman*—WILLIAM T. GETMAN, M.D. Buffalo  
*Secretary*—PAGE E. THORNHILL, M.D. Watertown  
*Pediatrics*  
*Chairman*—JOHN A. CARD, M.D. Poughkeepsie  
*Vice-Chairman*, JOHN AIKMAN, M.D. Rochester  
*Secretary*—ARTHUR W. BENSON, M.D. Troy  
*Eye, Ear, Nose and Throat*  
*Chairman*—IRVING W. VOORHEES, M.D. New York  
*Secretary*—EUGENE E. HINMAN, M.D. Albany  
*Public Health, Hygiene and Sanitation*  
*Chairman*—PAUL B. BROOKS, M.D. Albany  
*Secretary*—ARTHUR D. JAGUES, M.D. Lynbrook  
*Neurology and Psychiatry*  
*Chairman*—IRVING H. PARDEE, M.D. New York  
*Secretary*—EUGENE N. BOUDREAU, M.D. Syracuse

## ANOTHER ANGLE OF THE MEDICAL PRACTICE ACT

Governor Smith is sincere in his desire to help the Doctors formulate some type of law and it is ill-timed if the medical profession should not be willing to co-operate with him to establish some form of constructive legislation if this seem wise and necessary.

A resumé of the past would indicate that the medical fraternity have four types of objectors

- (1) The Bolshevik or radical disturber
- (2) The stand patter
- (3) The conscientious objector
- (4) Men who honestly differ

It is rather hard to convince any Governor if an element of distrust appears to be present that this very element does not represent the will of the medical profession. So many physicians are loath to publicly appear and voice their opinion, that a minority of objectors sounds like a majority of opinion.

Radical disturbers furnish a valuable source of constructive suggestion. They enable us to know what might happen under radical rule.

The stand patters can never get ahead as they

are not progressing with the demands of the state and are not honestly meeting the Governor half way.

The conscientious objector is a valuable asset inasmuch as he is willing to be convinced when the facts are clearly placed before him. He may be obstinate but at least he is honest.

The fourth group of men who honestly differ are usually convinced if the arguments are honestly presented.

The third and fourth groups make able allies when they understand basic facts and conditions.

It is absolutely necessary that our medical body in the state here does some constructive work.

Governor Smith has required that we shall meet the economic needs of the state. This does not mean state medicine, nor can it ever mean state medicine, but if the medical profession are to be a factor in public health we are of necessity compelled to meet public conditions. The officers of the State Medical Society are just as anxious to do the right thing for the profession as the men are to receive it. They are not

actuated by any personal motives and are just as jealous of missteps and mistakes and are using every possible method to try to safeguard the interests of the state. On the face of it, it looks as though new legislation might be unnecessary, as it has been claimed that the necessary machinery is now present, if the law is carried out. An analysis of this would indicate that this is partly true, but it is also true that while the machinery for doing this has been present for a good many years the machinery doesn't work. It is scattered, not centralized, left to the initiative of the various county societies, to District Attorneys placed in some counties where there are scarcely funds enough to maintain the work of the society and no funds at all for legal prosecutions. In other places the District Attorneys are helpless from an accumulation of other work and also a fear of political injury to themselves if they made their work of prosecution too effective.

It has been roughly estimated that the District Attorneys are efficient in about 50 per cent of the cases. This probably is a liberal view. If a centralized bureau for the prosecution of illegal practitioners is before any official it will only be because special men are appointed to do a definite object and to gather about themselves the machinery in a simplified form for securing thorough investigation of the necessary data. This is simplified spelling compared with some of the intricate methods that have been suggested. The experience in New York County has been that a few cases were prosecuted by the District Attorney, the majority were pigeon-holed.

There is no law that can make a District Attorney prosecute more cases than his time and facilities will admit. There are limits to his ability to prosecute. The argument has been suggested that the local counties at the present time could secure the necessary evidence, give it to the District Attorney and the question was solved. As we have previously stated unless the illegal practitioner is guilty of some very flagrant breach the local county is not stressed or sufficiently interested to secure legal evidence which is of any value to the prosecuting official. They have not the funds nor the time and develop a condition of apathy which encourages anyone to undertake the illegal practice of medicine with impunity. No body regrets more than the Governor the present method of doing business in the state. He agrees with us that it is poor government that the principle involved is wrong, but frankly states that it is the product of bad methods employed in the past and that it would be practically impossible to alter these conditions at the present time. We do not see how damning any object can bring about the needed reform. A distant area of the state the other day is quoted as stating that illegal practitioners, as far as they were concerned, did not exist, because only two or three

had been reported in their particular county. Little did they realize the growing and ominous problem to be met with in New York County at the present time.

The amended Medical Practice Act we feel sure will be very carefully pruned, added to, and examined with the utmost care by our eminent counsel, Mr. Whiteside, before being brought before any legal body. The men of the state should educate themselves as to the basic conditions, the needs of the whole state, and feel that when they act they are acting on behalf of all the physicians of the state and not of their particular locality. It is useless to suggest bugaboos which may never be realized but it is not a long step to imagine a public scandal which might so scare the people that they would require our State Board of Regents to examine every physician at present practicing to see if his present knowledge and activity in medicine warrants the continuance of the practice of medicine. This is within the state's province if it so chooses. Such a procedure is so extremely remote as to hardly warrant discussion, but the facts still remain that we are servants of the state, working and serving under the laws of the state and governed thereby. Therefore as partners in a great economic work we should endeavor to meet them half way and keep up with the economic needs of the times.

A free expression on the part of the medical profession as to some of the reasons for commending this law and some of the objections which are decidedly valid and proper would make interesting reading and I know the editors of the JOURNAL are anxious to present this opinion as it is received in the editor's office. There are some good ideas in a medical house-cleaning. We would be enabled to practice medicine in any part of the state instead of being required to register in each county. The state has no intention, nor can it take away a man's license to practice as granted by the Regents. This Governor Smith emphasized when the matter was brought to his attention. The fees collected will be properly administered in the conduct of our medical matters and there is every reason to believe if cases are properly chosen with the proper publicity attached a few test cases will render many prosecutions unnecessary as the offenders will promptly leave the state when they find that our authorities mean business.

The medical profession must be given the proper place in affairs of the state which they justly deserve. We can never be real co-workers if we stand pat and object to everything which differs from the experiences of our forefathers. This does not mean radical or foolish undertakings but it does mean that we cannot stand still and keep up with the rest of the state. If it is good, we want it. If it is not good, or undesirable, we don't want it.

O. S. W.

## LAY EDUCATION.

Equipped with a background of years of valuable experience, our legislative chairman will conduct his campaign for enactments favorable to the protection of the health interest of the State

The closer relationships which he has established with County Chairmen, and a livelier sense of interest in all members of the State Society which he has developed, would seem to promise him greater assistance than he has hitherto enjoyed, but he has all the handicaps that are enjoyed by an honest lobbyist who has nothing to trade

He is asking for nothing but the salvage of the children of the State, the salvage of the people who, by their citizenship, make up the State, the salvage of the crippled, of the insane, and of those incompetent to care for themselves

He has behind him only a small group of really educated, and really altruistic people

He has against him every faddist, every silly cultist, every job hunter, and every crooked place holder who has deified indirect methods of getting unearned, excessive reward from the public purse

The longer one studies the history of legislation, the attitude and arguments of legislators, the more important seems to be the education of our citizens, so that whatever professional, or business, lines they follow, they shall have impressed upon them certain fundamentals which they will respect and which will influence their mental attitude toward matters of public health, disease prevention, and the care of those who are physically and mentally in need of scientific medical attention

The special and scientific journals cover such limited fields that only a most limited influence can be attained and we must look for help to agencies of such broad distribution and influence as only the lay press possesses

While we must foster, watch, and fight legislation, we would do well to assiduously cultivate public opinion and constantly present to all the people educational matter along public health lines

Such a movement is being attempted by the Illinois State Society, a large number of the members of the Society having subscribed for its support

We herewith quote in full an editorial from *The South Side Review*, Chicago, of January 18, 1924, with the simple comment that it seems to us valuable health propaganda of the kind we should like to see every newspaper in the State of New York carrying, not only for brief campaigns, but for many years

If the members of county societies will make persistent effort they may succeed in enlisting the help of newspapers in every part of the State even to the extent of sacrificing revenue from quack advertisements

## A Portrait of Yourself by a Man Who Is Figuring When You Will Die

It is the business of E E Rittenhouse of the Equitable Life Assurance Society to figure when you will die

He keeps an eye on you all the time Not you personally, but you as an average American

And here is his report about you as presented to the life insurance presidents

You look smooth, pink and healthy

You are a good liver (He said *are*, not *have*)

You hurry The medium age at death of the American people is 43

Your eyes have been strained by inside work hence the glasses

You are seriously overstraining heart, arteries, kidneys, nerves and digestion—as the rapidly increasing death rate shows

You could detect and head off these troubles if you would go to a doctor for an occasional examination

Under exertion you are short-winded, due to lack of exercise or a bad heart.

Your four hundred muscles are virtually all soft and weak from lack of use

You are designed as an erect, outdoor animal, with feet and legs for service, but you lie down all night and sit down all day

You never walk when you can ride

The arches of your feet are gradually falling, because the muscles provided to hold them up have weakened from long disuse

Your ancestor lived on a farm, the proportion of people living in cities has increased 131 per cent in fifty years

You feed your stomach with all sorts of "tasty junk," much of which cannot be fully digested, so you develop auto-intoxication

With every pound of fat you gain your chances of a shortened life increase

You eat 30 per cent more food than your grandfather did, and 374 per cent more sugar

You spend 367 per cent more for patent medicines and drugs than your father did, and drink 54 per cent more coffee

In your easy-going, optimistic way, you are cheered by the fact that the general death rate is declining You fool yourself with the notion that this means a green old age for you

As a matter of fact, the decrease in the death rate is due to the better care of infants

Not only is the adult death rate not decreasing it is alarmingly increasing.

Since 1900 the death rate from Bright's disease has increased 15 per cent, from disease of the heart, 27 per cent

These are the diseases of adult life—the diseases of hurry and worry and overeating and nervous wear and tear

This is not our picture, remember. It is painted by Mr Rittenhouse, whose business it is to figure how much you ought to pay for life insurance, in view of the fact that you will probably die before you are fifty years old.

Mr Rittenhouse says there is hope for you. An annual medical examination, more exercise outdoors, less food, more dentistry, no booze, more walking and less taxicabs.

Most of all—no hurry and no worry.

Simple rules—sensible—guaranteed to put you across the fifty mark, with a good chance for sixty and maybe seventy-five.

But Mr Rittenhouse isn't very hopeful that you will adopt them. He has been watching you quite a long while—

Sitting up in his office, figuring away, figuring out about when you will die.

N B V E.

## PUBLIC HEALTH OBJECTIVES

**W**HAT public health objectives can be realized within the next few years? Another phase of the same question is, what are the lines along which improvement in health of a great number of persons may be expected? Twelve objectives were enumerated by Dr Hermann M Biggs a short time before his death. They are well worth the consideration of every practicing physician, for they represent the matured opinion of one who was a leader in the practice of both private and public medicine. The objectives are as follows:

- 1 The periodic examination of every individual
- 2 Broadened health education in schools, both public and normal
- 3 Reduction in the death and morbidity rates of infectious diseases.
- 4 Effective prevention of cardio vascular diseases
- 5 The solution of the causes of acute respiratory diseases and cancer
- 6 The prevention of diseases of nutrition and metabolism
- 7 The prevention of venereal diseases
- 8 An extension of the educational work of public health authorities
- 9 More effective promotion of work along

prenatal, maternity, infant welfare, and pre school age lines

- 10 The development of mental hygiene
- 11 More effective mouth hygiene
- 12 Efficient medical school inspection

The work along these twelve lines will be done by three groups of workers

- 1 Physicians in private practice.
- 2 Public officials
- 3 Lay organizations

Physicians will be the leaders of the public health official bodies and of lay organizations.

The relative responsibility for leadership in the twelve movements is indicated in the chart below.

It will be noticed that private practitioners of medicine are directly responsible for nine of these twelve movements.

Periodic examinations are recognized as essential to the preservation of health and activity of adults. Both the American Medical Association and the New York State Medical Society have voted to promote the examinations, but neither body has taken organized steps to promote them. The first essential in the movement is to provide for the education of medical practitioners in the examination of adults who are apparently healthy. This means instruction in the detection of incip-

ient defects and diseases while they are in the remedial stage. It also involves the demonstration of the practicality of the examinations of a large proportion of the adults of a considerable area, such as a county. The time is ripe for the medical societies to take up this subject. From a selfish point of view, this field is an undeveloped gold-mine for private physicians. It will also be promoted by lay organizations.

Hygienic education in schools is in the hands of the school officials. Dr. William A. Howe, Chief of the Division of Medical Examinations of School Children, has a practical plan of reaching the embryonic teachers in the normal schools and teaching them practical facts about infectious diseases, a teaching which is greatly needed. Hygiene teaching in public schools must be done largely by class-room teachers, and they must have the point of view of the practicing physician and the trained nurse. The object will not be to make the teachers into physicians or trained nurses, but to know enough fundamental facts to enable them to co-operate intelligently with physicians and nurses. Dr. Howe's plan deserves the support of the entire medical profession.

The next great step in the prevention of infectious diseases must be done by private physicians. The knowledge of efficient preventive methods of most diseases is now available, and yet the death rate for diphtheria and other common diseases has not been reduced materially for ten years. The New York State Department of Health has found that a big factor in the cause of death from diphtheria has been the failure of physicians to recognize the disease and to give antitoxin early. The leaders in medical societies must attack the problem of reaching those physicians who need more knowledge, and above all more inspiration to apply the knowledge which they have, and this need applies to health officers, also.

The prevention of cardio-vascular diseases depends on the education of the people as well as of physicians. Instructing the teachers in the normal schools, real medical inspection of school children, and instruction of all pupils in mouth hygiene, are all essential in preventing the focal infections which lead to cardio-vascular diseases. Physicians themselves need to be inspired to do better work on diseased tonsils, and to advise dental work for young children.

Knowledge of the causes of acute respiratory diseases is in about the same stage as that of acute intestinal diseases a generation ago, but patient observation and research by trained medical men and laboratory workers in schools and endowed foundations of learning, will doubtless solve the problem of the causation, classification, and prevention of acute respiratory diseases, and will result in their control just as it has in the control of typhoid, and the paratyphoids and

dysenteries. But already there is sufficient knowledge to enable physicians to control colds, sore throats, and pneumonias. Intestinal diseases have been controlled by the disposal of the excretions of the kidneys and intestine. An equally efficient control of the excretions of the nose and throat will prevent acute respiratory diseases. The problem is to convince both physicians and the people generally that this control can be accomplished by the application of simple methods that are already known. Private physicians will be efficient agents in this control when they insist on the disposal of excretions of the nose and throat by every person whom they treat for a cold, sore throat, and pneumonia. Health officials and school teachers will also spread the knowledge of prevention.

The control of diabetes, scurvy, rickets, gout, and other disorders of nutrition and metabolism is a problem of both private practice and the education of the people. Dietetics is a neglected study among physicians, and still more so among pupils in the public schools. Economic conditions for which officials are largely responsible also have much to do with dietaries and weakened states of the body. Intelligent advice by physicians regarding dietaries will go far toward the prevention of nutritional disorders and susceptibility to infectious diseases, and toward promoting health and vigor of the great mass of the people.

The prevention of venereal disease is primarily a medical problem. Physicians generally feel it beneath their dignity to treat venereal cases, and are not equipped to deal with them, and they have a degree of responsibility for the fact that a very great proportion of venereal victims fail to seek reliable treatment. The weekly reports of the State Department of Health have shown that syphilis is almost at the top of the list as a cause of death. Physicians in private practice have a vast field to cover in the detection and treatment of venereal diseases. Law makers and educational authorities also have a grave responsibility in the prevention of these diseases.

Public health authorities and lay organizations are co-operating in conducting vast campaigns of publicity and education along health lines. Among the efficient means of education are newspaper articles, radio talks, public-health lectures and exhibits, and moving pictures, all of which are eagerly sought and received by the public. They have a great value along advertising, inspirational, and informational lines.

The reduction of mortality in the early years of life must be accomplished by the co-ordination of the efforts of physicians, officials, and lay organizations. Expectant mothers must be reached by prenatal workers, officials are largely responsible for economic conditions, and lay organizations are responsible for financial aid, for the

creation of public sentiment, and for hospitals and other means for providing medical care. Child hygiene work has been eminently successful, and its support by physicians is assured.

The practice of mental hygiene is only in its infancy. Its success rests upon officials and lay organizations even more than upon physicians. But yet physicians must be leaders in the work of preventing insanity, and in all other phases of mental hygiene. The people must be educated regarding the dangers of the stresses and strains of modern life and pleasure. The very great influence of heredity for good and evil must be taught, and the application of eugenics in marriage must be stressed. Public officials must do better work in the control of mental defectives and criminals, and lay organizations are necessary to carry on the work of relief, social, visitation and educational propaganda. Through all these activities the work of the physician is of commanding importance.

Dentistry is becoming more and more recognized as a branch of medicine, and mouth hygiene has assumed commanding importance in the light of a knowledge of the relation of mouth infections to diseases of the heart and arteries.

Physicians of the future will acquire the habit of giving advice on mouth hygiene, and of referring their cases to a dentist at the beginning of trouble with teeth. The subject of mouth hygiene will also be taught in schools.

Medical school inspection involves the application of all lines of medical practice to all individuals of school age. The time will probably soon come when the correction of remediable defects of school children will be compulsory, and then the services of physicians will be increasingly sought and practitioners in every branch of medicine will be the gainers.

Does all this indicate that public officials and lay organizations will put the private practitioner out of business? The field of the practice of medicine is no longer confined to the diagnosis of disabling sickness, the giving of pills and powders and potions, and the performance of surgical operations. The field of service and opportunity of the future physician will be enlarged far beyond anything known at present. It will be a great satisfaction to be a physician and to share in the high honor of promoting the health, strength, and happiness of one's brethren.

F O

## FACTORS IN FAVOR OF THE UNQUALIFIED PRACTITIONER.

"Certain external factors must inevitably work in favor of the unqualified. Of these one of the principal is the inherent tendency of the public to believe that the irregular practitioner must have some peculiar ability either special skill in methods of manipulation unknown to the profession or an almost occult power of seeing what is wrong inside or what is the effect of his manipulations. A second factor is the unrestricted power of the unqualified to advertise, either directly or through the mouths of their patients. A third is perhaps the most important. It is that the failures of the unqualified are in almost every case hidden. The patient who visits

a bone-setter and is cured boasts of the fact widely, but those who are not cured or who are made worse are perhaps a little ashamed that they have been gulled, they say nothing of their experience, unless perhaps to a medical man who subsequently treats them and who discreetly maintains silence."—From an address on Manipulative Surgery, delivered before the Section on Orthopedics of the Royal Society of Medicine, Oct 2, 1923, by R C Elmslie, M S, London, F R C S, England, President of the Section, reported to the *Lancet*, 205 821-823 (Oct. 13), 1923.

J N V V

## INFORMING THE PUBLIC

"In the sphere of teaching the medical profession has not achieved a commanding position. The public has not been fully apprised of the information which is rightly theirs and which would contribute to their well being. An attitude of aloofness prompting a rather negative activity in the affairs of men at large seems too prominent in the ranks of medical men—a tacit acceptance in general that any form of publicity emanating from or referring to a physician, even in the interests of society, is a breach of the professional code in that attention is called to that particular physician. Such attention is called a form of personal advertising which is abhorrent to all

true disciples of medicine. This deadening point of view greatly militates against professional men being the leaders in society's uplift that their scientific knowledge, which knowledge it should be their duty to promulgate, affords them the opportunity of being.

"Now is the time to inaugurate an intensive program of acquainting the people with the functions of scientific medicine in the body politic. Here and there individual physicians have brushed aside the traditional barriers and have told the story of medicine in plain language. There is no reason why the romance of the healing art, its slow mastery through centuries over disease

should not be told. Let us all swing farther away from the narrow confines of our calling, make larger contacts with men and things in the other circles of life, and energize ourselves into a sales force in biologic education. Society needs the knowledge we possess; it has given but trifling thought in its structure of education to the real foundations—the biologic studies.

"Medicine is no more to be hedged about with mystery and heavy dignity than any other calling. We have great pride in our achievements, and there should be no discredit to us in heralding them to the world. At the same time, we must learn to tell the truth about our limitations, about the diseases which baffle and the paucity of knowledge concerning them. No presentation of truth can mar the part of true medicine in the destiny of man.

"Surely public activity of this character could not be construed as advertising, which the code of ethics defines as direct or indirect laudatory articles in the public press concerning a physician's management of cases.

"If group medicine were responsible for like advertising, it would justly be subject to condemnation. But if the members of a group, believing that co-operative practice is beneficial to the public welfare; acquaint the people with their purposes, to me it seems in consonance with the views outlined above.

"So the necessity for careful selection of the personnel of the group is evident. The members must have the same aims, be enthusiasts for success, willing to make sacrifices that the objectives may be obtained, positive heralds of the co-operative method and loyal to each other.

"This is what the Legislative Bureau has attempted to do in relation to the physicians and through the physician to reach the legislator and set before him the information which is rightly his and which would help him in making his decisions for the interest of the public good in public health matters."

Quotation from an article by Rexwald Brown, M.D., page 447, December issue of the *American Medical Association Bulletin*. J. N. V. V.

## TOO MANY COUNTY SOCIETIES SLEEPING.

"Too many of our county societies are sleeping, arousing just enough at necessary intervals to keep their names on the books. The council is held responsible for them under the constitution and by-laws of the state association. It is hard to believe that the councils in some instances realize their responsibility. Perfunctory reports made at some annual meetings indicate that they do not. Councillors' reports made up from letters sent out the week before the annual meeting of the state association are not reports—they are evasions. Councillors are supposed to visit—actually visit—the societies in their respective districts at least once each year. How many do so? Councillors are supposed to 'inquire into the condition of the profession,' to 'organize component societies where none exist,' to be 'peace-makers and censors,' to 'improve the zeal' of county societies. These things cannot be done by writing a few letters ten days before the annual meeting and then turning in what purports to be a report, which, formulated in that manner, nearly always makes it appear that everybody is happy and that medical organization is 100 per cent efficient, when, as a matter of fact, the formality of a funeral is about all that is necessary,

in some instances, to carry out the very distinct indications as presented by the situation that really exists."

The above quotation from the *American Medical Association Bulletin* portrays the trouble which we have at the Legislative Bureau when questions of moment are to be decided upon. We are loath to prod the members of the County Societies individually, but find it necessary so to do in order that we do not get an unpleasant reaction after making a decision in the Committee on Legislation, by members saying "I didn't have a chance to register my opposition."

One communication received by us from a County Legislative Chairman makes the statement that he requested the President of his County Society a number of times to call a meeting on an important matter of legislation, and a month passed before this question was acted upon, when it should have been dealt with as soon as possible, at least at an official meeting regularly called whereby the County Legislative Chairman could get some idea of the sentiment of those present, and could reason out that those who were not present probably were not interested in the question. J. N. V. V.

# LEGAL

By George W. Whiteside, Esq.

## THE GOVERNMENT'S POWER AND RESPONSIBILITY UNDER MEDICAL LICENSING LAWS

THE practice of the healing art, whether by the employment of a knowledge of science, by prayer, laying on of hands, adjustment of vertebrae, incantations or any other means, comes within the statutory definitions of the practice of medicine

"The purpose of the general statute is to protect citizens and others of the state from being treated in their physical ailments and diseases by persons who have no adequate or proper trained education or qualifications to treat them" (Peo v Cole, 219 N Y 98)

It is, therefore, for the protection of the public that our statute requires rigid pre medical academic education and four years of seven months each in an approved medical school in this state to qualify one to be licensed as a physician

Our Court of Appeals places upon the doctor the duty "of possessing that reasonable degree of learning and skill that is ordinarily possessed by physicians and surgeons in the locality where he practices and which is \* \* \* necessary to qualify him to engage in the business of practicing medicine and surgery \* \* \* He is bound to keep abreast of the times" (Pike v Honsinger, 155 N Y 201)

It would appear, therefore, that a physician who has received his license has not consummated the complete qualification under the law, for he must continue to progress in his science and keep abreast of current improvements Justice Field went so far as to say in this regard

"It would not be deemed a matter of serious discussion that a knowledge of the new acquisitions of the profession as it from time to time advances in its attainments for the relief of the sick and suffering should be required for continuance in its practice"

These rules of law appear to be most stringent in testing the qualification of the physician upon his beginning practice and for weighing his qualifications to continue thereafter in his practice. Each licensed physician of this state has met all of these requirements and has received a certificate from the state that he possesses the necessary learning and skill for the practice of his profession He has earned and is entitled to receive public recognition for his accomplishment, public support for his effort and legal protection against the inroads of impostors, frauds and incompetents

An examination of the requirements for ad-

mission to the various chiropractic schools throughout the country and a survey of the curriculum of such schools show clearly that they do not in any wise measure up to the requirements of our statute to entitle them to recognition in this state. We know that a large majority of chiropractors are uneducated and totally unqualified from the standpoint of educational standards

A license to practice a profession, particularly one dealing with the treatment of diseases, is not a mere grant of permission by the state to do a certain thing, but is a certification of the licensee's qualification to do those acts which his license authorizes The courts recognize that "comparatively few can judge of the qualifications of learning and skill which he (the physician) possesses" Our highest court has said

"Reliance must be placed upon the assurance given by his license issued by an authority competent to judge in that respect that he possesses the requisite qualifications \* \* \*

"The law intended to secure such skill and learning in the profession of medicine that the community might trust with confidence those receiving a license under authority of the state"

As the average individual is unable to judge the qualifications of learning and skill of a practitioner as the court stated, the state assumes the responsibility of passing upon such practitioner's learning and skill through an agency competent to judge such qualifications, with a view that the community "might trust with confidence those receiving a license under authority of the state." Should the state grant licenses to chiropractors to practice chiropractic in the treatment of all diseases, the state would thereby represent to the public that a push of one or more of the vertebrae is a proper and approved method for the treatment of various diseases and it would further represent that the person holding such license as a chiropractor was qualified to treat those diseases by that method and that the public could trust them with confidence in such treatment If such license were granted chiropractors after the strictest educational qualifications, the state would still be certifying that chiropractic is a proper means of treating these diseases This is the fundamental vice underlying the licensing of chiropractors in this state. The state cannot consistently by one law require vaccinations for smallpox and by licensing chiropractors license

them to treat smallpox without vaccination. The Board of Health cannot require the use of anti-toxin for diphtheria and at the same time recognize chiropractic which eschews the use of such treatment as a proper means of therapy in cases of diphtheria. These illustrations may be extended to numerous other diseases. The mortality of many of these diseases has been enormously reduced by a scientific study of their causes and the application of scientific principles for their cure. The licensing of chiropractic would constitute a legal authority to abandon the scientific treatment of these diseases and to substitute in its stead a treatment justified only by its sponsors upon an assumed dogma.

If a medical doctor in a diphtheria case fails to use the approved treatment by administering anti-toxin he renders himself liable to the law. If a chiropractor were licensed he would apparently be free to treat diphtheria without the use of anti-toxin, and escape liability, because the

state by licensing the chiropractor would certify that the chiropractic method of treatment was proper and approved in the treatment of disease. Such a certification of chiropractic as a proper means of treatment would in such cases as diphtheria and smallpox, as well, in fact, in many other diseases such as tuberculosis, typhoid, etc., constitute not a license of qualification but a license to take human life.

How many of the legislators who will vote on such a chiropractic bill are willing to be treated for any of the diseases mentioned by chiropractic means? If they are not, should they by licensing chiropractors recommend such treatment in these cases to the public? Shall the noisy political activities of the chiropractors in this state, the only objective of which is the breaking down of the wall of public protection in our medical licensing system, prevail over reason, common sense and good faith?

## IGNITION OF CLOTHES BY ELECTRIC SPARK RESULTING IN A CLAIMED BURN OF BACK

THE plaintiff, a clerk, went to the office of the defendant doctor one evening toward the close of office hours complaining of severe pains in his back and that he had been sick all his life with stomach trouble, that he had been operated upon and his appendix had been removed, after which operation he had gone to various physicians but had received no benefit from any of them, that he had pains in the epigastric region going around the thorax to the spine and then upward. His appearance was pallid and sickly. An examination disclosed some disturbance in the digestive organs for which medication was prescribed. He returned to the doctor about a week later and to relieve the pain in his back a violet ray was administered through the clothing under the scapula for about one minute. The patient then left the doctor's office.

The plaintiff's next appearance was by his counsel serving a summons and complaint in an action asking for \$10,000 damages in that the doctor had caused and inflicted upon the plaintiff's back in the application of the violet ray a second degree burn  $2\frac{1}{2} \times 3$  inches. When the case finally came on for trial the plaintiff produced the clothing which he had worn that day

showing a hole in the coat of about the size of a half dollar, and the hole getting larger in size in the garments nearer the skin, so that there was a hole in the undershirt covering almost half of the back and a hole almost as large in his outer shirt. His testimony was to the effect that after leaving the doctor's office he stood upon the street for five or ten minutes, walked five blocks to the elevated railroad station, there waited for a train and then rode a distance of about six miles and walked six or seven blocks from the station to his home, that upon arrival at his home he removed his coat and other clothing and then found for the first time that the same were burned, the holes in the clothing penetrating from the coat down to his skin and that he had a large blistered area under the scapula. From the time he left the defendant's office until he reached his home, either while on the street or in the train, he did not feel anything burning him. His story was so ridiculous and after showing the improbability of the happening of the same, it took the jury only a few minutes to resolve the question of liability in favor of the defendant, dismissing the plaintiff's complaint.

# LEGISLATION

By James N. Vander Veer M.D.

## LEGISLATIVE BILLS

The following bills affecting the practice of medicine have been introduced in the Legislature

STATE OF NEW YORK

No 127

Int 127

IN SENATE,

January 14, 1924

Introduced by Mr. Love—read twice and ordered printed, and when printed to be committed to the Committee on Internal Affairs of Towns, Counties and Public Highways.

### AN ACT\*

To amend the county law, in relation to public health nurses.

*The People of the State of New York represented in Senate and Assembly do enact as follows:*

Section 1, Subdivision forty-four of section twelve of chapter sixteen of the laws of nineteen hundred and nine, entitled "An act in relation to counties, constituting chapter eleven of the consolidated laws," such subdivision having been added by chapter one hundred and thirty of the laws of nineteen hundred and twenty-one, is hereby amended to read as follows:

44 The board of supervisors of any county [not having a county tuberculosis hospital established under the provisions of sections forty five to forty-nine hereof], *except a county constituting a general health district created under the public health law*, shall have power to appoint and employ such public health nurses as it may deem proper.

§ 2 This act shall take effect immediately.

EXPLANATION—Matter in *italics* is new; matter in brackets [ ] is old law to be omitted.

STATE OF NEW YORK

No 128

Int. 128

IN SENATE,

January 14, 1924

Introduced by Mr. Love—read twice and ordered printed and when printed to be committed to the Committee on Public Health.

### AN ACT\*

To amend the public health law, in relation to state aid to counties engaging in public health work.

*The People of the State of New York represented in Senate and Assembly, do enact as follows:*

Section 1 Sections nineteen, nineteen-a and nineteen-b of chapter forty nine of the laws of nineteen hundred and nine, entitled "An act in

EXPLANATION—Matter in *italics* is new; matter in brackets [ ] is old law to be omitted.

relation to public health, constituting chapter forty five of the consolidated laws," as added by chapter six hundred and sixty two of the laws of nineteen hundred and twenty three, is hereby amended to read as follows:

§ 19 State aid to counties engaging in public health work. Whenever the board of supervisors of a county, exclusive of a county having within its boundaries a city [of the first or second class] *having a population of fifty thousand or upwards*, shall appropriate and expend moneys for the construction, establishment or maintenance by such county of a county, community, or other public hospital, clinic, dispensary or similar institution, or for the purpose of defraying the expenses of such county in any public enterprise or activity for the improvement of the public health, or any public health work undertaken by such county, *within limits to be prescribed by the state commissioner of health*, such county shall receive state aid in the manner and subject to the conditions prescribed in this article. The legislature from time to time shall make appropriations for the purpose of rendering such state aid. *The state commissioner of health is hereby empowered to prescribe limitations upon the aid to be granted, under applications now pending or hereafter made.*

§ 19 a Approval of state commissioner of health. It shall be the duty of the state commissioner of health to formulate standards of construction, equipment, service administration and work which must be complied with by such counties in order to be entitled to state aid, and no state aid shall be given to any county unless the state commissioner of health, after [inspecting] inspection and examination by him or his representative, shall make his certificate that such construction, equipment, service, administration or work is necessary to the public health and conforms to the standards so established therefor, *and to the limits prescribed by him as required by section nineteen of this article.*

§ 19 b Statement by clerk of board of supervisors, approval, amount of state aid, payment. The clerk of the board of supervisors of each such county shall on or before the first day of January of each year, transmit to the state [comptroller] *commissioner of health* a statement, verified by the chairman of the board [ ] and certified by the clerk, which shall state the

amount appropriated [and expended] during the preceding year by such county for a purpose specified in section nineteen of this article. On or before the first day of March next succeeding, the state commissioner of health shall transmit to the comptroller a certificate stating whether or not the amount specified in each such statement, or any part thereof, was [expended] appropriated by the county for a purpose mentioned in section nineteen of this article, was necessary to the public health and was conformable to the standards and limits established by the commissioner of health. On receiving such approval of the state commissioner of health, the comptroller shall draw his warrant upon the state treasurer for fifty per centum of the amount, as approved by the state commissioner of health, appropriated [and expended] by each such county, and the treasurer shall pay the amount set forth in such warrant to the county treasurer of the county entitled thereto. *No single grant of state aid shall be made covering more than one year, and no funds granted as state aid to any county shall be expended for any purpose other than that for which such aid was granted under this article and as limited by the state commissioner of health, and no funds so granted to a county by the state shall be expended unless an equal amount of county funds be expended for the same purpose or purposes. Any funds granted as state aid to any county and unexpended at the end of the year for which such grant was made shall be returned at the end of such year to the state treasurer.*

§ 2 This act shall take effect immediately

STATE OF NEW YORK

No 229

Int 229

IN SENATE,

January 21, 1924

Introduced by Mr. Byrne—read twice and ordered printed, and when printed to be committed to the Committee on Public Health

AN ACT\*

To amend the public health law, in relation to the practice of chiropody and podiatry

*The People of the State of New York, represented in Senate and Assembly, do enact as follows:*

Section 1 Article thirteen of chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," is hereby amended by adding thereto a new section, to follow section two hundred and eighty-one-a, to be section two hundred and eighty-one-b, to read as follows:

§ 281-b *Any person who shall advertise to practice podiatry, without being lawfully licensed*

\* EXPLANATION—Matter in italics is new, matter in brackets [ ] is old law to be omitted

*and registered as a podiatrist, or any business corporation which shall practice podiatry or advertise to practice podiatry, or any person who shall practice or advertise to practice podiatry under a certificate of trade name, or any person or business corporation who shall share in, accept, take or apply to his or its use, any moneys which are proceeds of the practice of podiatry by a licensed and registered podiatrist, or any person or business corporation who shall employ, contract with, or permit with his or its consent any one other than a licensed and registered physician, or a licensed and registered podiatrist to diagnose, treat, operate, or prescribe for any ailment, deformity or physical condition of the foot, shall be guilty of a misdemeanor, and shall, on conviction for each and every offense be punished by a fine of not less than fifty dollars or more than one hundred dollars or by imprisonment for a term not less than thirty days and not more than one year or by both fine and imprisonment.*

This section shall not be construed to forbid or prevent the employment by any person, association or corporation of a duly licensed and registered podiatrist to treat employees or members thereof.

§ 2 Such article is hereby amended by adding thereto a new section, to follow section two hundred and eighty-one-b, to be section two hundred and eighty-one-c, to read as follows:

§ 281-c *Any licensed and registered chiropodist who shall use, distribute, or display upon any card, sign or advertisement, the words, or any of them "foot specialist," "surgeon," "orthopedic specialist," or in any manner upon any card, sign, or advertisement hold himself out as being able to treat all diseases or all ailments or all conditions of the foot, shall be subject to the revocation of his license and the annulment of his registration in the manner provided by section two hundred and eighty-one for proceedings for the revocation of a license and the annulment of a registration.*

§ 3 This act shall take effect immediately

STATE OF NEW YORK

No 321

Int 317

IN SENATE,

January 23, 1924

Introduced by Mr. Antin—read twice and ordered printed, and when printed to be committed to the Committee on Public Education

AN ACT\*

To amend the education law, in relation to the appointment of a state specialist for eyes and ears

*The People of the State of New York, represented in Senate and Assembly, do enact as follows:*

\* EXPLANATION—Matter in italics is new, matter in brackets [ ] is old law to be omitted

Section 1 Article twenty a of chapter twenty one of the laws of nineteen hundred and nine entitled "An act relating to education constituting chapter sixteen of the consolidated laws" as amended by chapter one hundred and forty of the laws of nineteen hundred and ten, which article was added by chapter six hundred and twenty-seven of the laws of nineteen hundred and thirteen, is hereby amended by adding thereto a new section, to be known as section five hundred and seventy-seven a, to read as follows

§ 577-a State specialist for eyes and ears The commissioner of education shall also appoint a specialist for eyes and ears in the bureau of medical inspection who shall receive an annual salary, to be fixed by the commissioner within the amount of moneys appropriated therefor. He shall assist the state medical inspector in making eye and ear tests of the pupils of the public schools as required by this article. He shall also assist in providing for students in the state normal schools, city training schools and training classes instruction and practice in the best methods of testing the sight and hearing of children and shall perform such other duties as the commissioner of education may prescribe

§ 2 This act shall take effect immediately

STATE OF NEW YORK

No 565

Int. 565

IN ASSEMBLY

January 25, 1924

Introduced by Mr Lattin

AN ACT\*

To amend public health law, in relation to records and reports of vaccination.

*The People of the State of New York represented in Senate and Assembly, do enact as follows*

Section 1 Section three hundred and eleven of chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," is amended by chapter one hundred and thirty three of the laws of nineteen hundred and fifteen, is hereby amended to read as follows

§ 311 Vaccination How Made, Reports  
1 No person shall perform vaccination for the prevention of smallpox who is not a regularly licensed physician under the laws of the state. Vaccination shall be [performed] performed in such manner only as shall be prescribed by the state commissioner of health

2 (Same as old law)

EXPLANATION—Matter in *italics* is new matter in brackets [ ] is old law to be omitted

3 Every physician performing a vaccination shall within ten days make a report to the [state commissioner of] local health officer upon a form furnished by [such] the state commissioner of health setting forth the full name and age of the person vaccinated and, if such person is a minor, the name and address of his parents, the date of vaccination, the date of previous successful [vaccination] vaccination if possible, the name of the maker of the vaccine virus, [and] the lot or batch number of such vaccine virus and whether upon re-examination after a proper interval such vaccination was found to be successful or non successful

4 Every local health officer shall retain in the files and records of his office every report of a vaccination reported to him under the provisions of the preceding paragraph and shall report once in each month to the state department of health the number of vaccinations reported to him during the preceding month together with the number of those which were successful and the number non successful. Such report shall be made in such manner as shall be prescribed by the state commissioner of health

§ 2 This act shall take effect immediately

STATE OF NEW YORK

No 545

Int. 542

IN ASSEMBLY

January 23 1924

Introduced by Mr Wallace—read once and referred to the Committee on Public Health

AN ACT\*

To amend the public health law, in relation to violations of rules or orders of local boards of health

*The People of the State of New York, represented in Senate and Assembly do enact as follows*

Section 1 Chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," is hereby amended by adding a new section to be section twenty-one d, to read as follows

§ 21-d. Violations of orders of local boards. Local boards of health may prescribe that a person who wilfully violates or refuses or omits to comply with any lawful order or regulation prescribed by it or a local health officer, shall be guilty of a misdemeanor punishable by a fine not exceeding fifty dollars or imprisonment not exceeding six months, or both

§ 2 This act shall take effect July first nineteen hundred and twenty-four

EXPLANATION—Matter in *italics* is new matter in brackets [ ] is old law to be omitted

## SENATE

Senate Bill Int No 76 (Print No 76), by Senator Robert C Lacey of Erie County, which was referred to the Senate Judiciary Committee, has appeared in the Assembly as Assembly Bill Int No 230 (Print No 230) by Assemblyman Owen M Kiernan of New York, and has been referred to the Assembly Judiciary Committee

This bill has to do with the repealing of the Charter of the Rockefeller Foundation

No further comment will be made on the bill

---

Senate Bill Int No 127 (Print No 127), by Senator Wm L Love, of Kings County, concurrent Assembly Int No 267 (Print No 267), by Assemblyman Simon B VanWagenen, of Ulster County, is printed here in full for the information of the profession

No comment on this measure

---

Senate Bill Int No 128 (Print No 128), by Senator Wm L Love, of Kings County, concurrent Assembly Int No 232 (Print No 232), by Assemblyman Frank H Latun, of Orleans County, is printed here in full

The attention of County Medical Societies is called as to whether this measure affects them or not as a group

No further comment will be made thereon

---

Senate Bill Int No 140 (Print No 140), by Senator Michael E Reiburn, in reference to the

Workmen's Compensation Law, will be dropped  
No further comment

---

Senate Bill Int No 141 (Print No 141), by Senator Michael E Reiburn, in reference to the Workmen's Compensation Law, will be dropped  
No further comment

---

Senate Bill Int No 142 (Print No 142), by Senator Michael E Reiburn, in reference to the Workmen's Compensation Law, will be dropped  
No further comment

---

Senate Bill Int No 175 (Print No 175), by Senator Michael E Reiburn of New York, concurrent Assembly Int No 195 (Print No 195), by Assemblyman Julius S Berg of Bronx County, in reference to the State Institute for the Study of Malignant Disease, at Buffalo, N Y

We have had no comment on the bill, so it will be dropped

---

Senate Bill Int No 176 (Print No 176), by Senator Michael E Reiburn, of New York, concurrent Assembly Bill Int No 234 (Print No A 234), by Assemblyman James Male, of New York County, in reference to giving health commissioner control of hospital for care of crippled and deformed children at West Haverstraw

We have had no comment on the bill so it will be dropped

---

## NEW BILLS SINCE LAST ISSUE OF THE JOURNAL

Senate Int No 229 (Print S 229), by Senator Wm A Byrne, of Albany County, concurrent Assembly Int No 507, by Assemblyman Paul T Kammerer, Jr, of New York, would add new sections 281-b, 281-c, Public Health Law, relative to the practice of chiropody and podiatry. The bill has been referred to the Public Health Committee in each house

Your Committee on Legislation is in favor of the bill and it will be dropped from further comment

---

Senate Int No 285 (Print No S 289), by Senator Morton J Kennedy, of New York City, concurrent Assembly Int No 342 (Print No A 342), by Assemblyman Morris Weinfeld, of New York. This bill was printed in the February 1st issue of the JOURNAL, under Assembly Int

No 342, and is the same bill as introduced last winter by Assemblyman Maurice Bloch, and against which the Medical Society must be strongly opposed

Individual members of the Society are asked to address communications to their representatives in the Senate and Assembly along the line of the letter which appeared in the February 1st issue of the JOURNAL. This bill is open to the same criticism in that it would penalize the general practitioner in the way of more paper work, bookkeeping, vexatious surveyance, and in no way seeks adequate means to cut off the illicit supply by adequate inspection for the prevention of smuggling of the drugs

While the physician is and always should be ready to protect the public and to favor reasonable legislation, they must at all times stand pre-

pared to protest and work against such hardships as will be thrust forward under the guise of betterment, but which in reality imposes greater hardships on the profession in the loss of time and money which in the last analysis must be pro rated among the same public who presumably would be protected by this type of legislation.

Correlation between the State Department of Education, the State Department of Health and the Attorney General's office, with the State police would seem to be sufficient under the present laws to settle the narcotic question beyond peradventure without further legislation.

A special effort should be made to address letters to the members of the Committees on Public Health of both Senate and Assembly, whose names and addresses have been printed in the February 1st issue of the JOURNAL, asking that they protest against those features of the bill which impose the hardships on physicians.

Senate Bill Int No 317 (Print No S 321) by Senator Benjamin Antin, of New York City concurrent Assembly Int No 370 (Print No

A 372), by Assemblyman F S Cole of Herkimer County, which has been referred to the Public Education Committee in both Senate and Assembly, is printed here in full for the purpose of criticism and for favorable or unfavorable action on the part of members of the County Medical Societies.

Your Committee on Legislation asks that reports of such action be immediately sent to the Legislative Bureau in order that we may be posted as to the position to take thereon.

Senate Bill Int No 347 (Print No S 351), by Senator Bernard Downing, of New York, concurrent Assembly Int No 567, by Assemblyman Joseph A McGinnies, of Chautauqua County, would amend sections 17, 65, Insanity Law, relative to approval by Governor of contracts for improvements to State Hospitals for Insane.

The Senate Bill has been referred to Senate Finance Committee.

The Assembly Bill has been referred to Assembly Ways and Means Committee.

No comment on the bill as yet.

## ASSEMBLY

Assembly Int No 10 (Print No 10), by Assemblyman Ansley B Borkowski, of Erie County, concurrent Senate Int 357, by Senator Robert C Lacey, of Erie County, in re Workmen's Compensation Law.

One communication has been received at the bureau which voices no opposition to the bill.

Assembly Int. No 43 (Print No A 43), by Assemblyman Wm S Hart, of Richmond County, concurrent Senate Int No 63 (Print No 63), by Senator Michael E Reburn, will be dropped.

Assembly Int. No 48 (Print No 48), by Assemblyman Paul T Kammerer, Jr., of New York, concurrent Senate Int No 68 (Print No S 68), by Senator Thos I Sheridan, will be dropped.

Assembly Int. No 54 (Print No A. 54), by Assemblyman Samuel Mandelbaum, of New York City, will be dropped.

Assembly Int No 65 (Print No A. 65), by Assemblyman Joseph Reich, of Kings County, will be dropped.

Assembly Int. No 66 (Print No 66), by Assemblyman Joseph Reich, of Kings County—

### THE MEDICAL INSPECTION IN SCHOOL BILL

Attention is again called to the comment on the same, under the "Special Notice" in the February 1st issue of the JOURNAL, as well as to the bill published complete in that issue of the JOURNAL. No concurrent Senate Bill has made its appearance.

Assembly Int. No 195 (Print No. A 195), by Assemblyman Julius S Berg, concurrent Senate Int No 175 (Print No S 175), by Senator Michael E Reburn, of New York, will be dropped.

Assembly Int. No 196 (Print No 196), by Assemblyman Julius S Berg, of Bronx County, will be dropped.

Assembly Int. No 228 (Print No A 228), by Assemblyman Henry O Kahan, of New York City, to re practice of optometry, would insert further clauses whereby the regents would have power to revoke any certificate of registration or exemption of an optometrist who may be guilty

of fraud, deceit, *unprofessional conduct* or *misrepresentation* in his practice or in his advertising, has been convicted of crime, or is a habitual drunkard, or grossly incompetent to practice optometry

*Comment* No comment will be made further than that it is an attempt to do away with practitioners of optometry to whom licenses have been issued and who have proven themselves incompetent in one way or another to practice optometry

Assembly Int No 229 (Print No 229), by Assemblyman Henry O Kahan, of New York City, has to do with increasing the fines and penalties and the manner of their collection in relation to the practice of optometry

*Comment* No comment thereon

Assembly Int No 232 (Print No 232), by Assemblyman Frank H Lattin, of Orleans County, concurrent Senate Int No 128 (Print No S 128), by Senator William L Love of Kings County, will be dropped

Assembly Int No 234 (Print No A 234), by Assemblyman James Male, of New York County, concurrent Senate Int No 176 (Print No S 176), by Senator Michael E Reiburn, of New York, will be dropped

Assembly Int No 267 (Print No A 267), by Assemblyman Simon B VanWagenen, of Ulster County, concurrent Senate Int No 127 (Print No S 127), by Senator Wilham L Love, of Kings County, will be dropped

Assembly Int No 277 (Print No A 277), by Assemblyman John H Conroy, of New York City, will be dropped

Assembly Int No 309 (Print No A 309), by Assemblyman Joseph Reich, of Kings County, requiring employers to furnish nursing and first aid service in factories, mercantile and other establishments

*Comment* See last week's issue of the JOURNAL The bill has not made its appearance as yet in the Senate

Assembly Int No 342 (Print No A 342), by Assemblyman Morris Weinfeld, of New York City, concurrent Senate Int No 285 (Print No 285), by Senator Morton J Kennedy, of New York City

The Narcotic Bill See comment under concurrent Senate Int 285

#### NEW BILLS IN ASSEMBLY SINCE LAST ISSUE OF THE JOURNAL.

Assembly Int No 370 (Print No 372), by Assemblyman F S Cole of Herkimer County, concurrent Senate Int No 317 (Print No S 321), by Senator Benjamin Antin of New York City

See concurrent Senate Int No 317 for digest and comment

Assembly Int No 507 (Print No A 509), by Assemblyman Paul T Kammerer, Jr., of New York, concurrent Senate Int No 229 (Print No S 229), by Senator Wm Byrne, of Albany County

See concurrent Senate Int No 229 for digest and comment

Assembly Int No 542 (Print No A 545), by Assemblyman Edwin W Wallace, of Nassau County, referred to the Assembly Public Health Committee, is printed here in full for the information of the profession

Assembly Int No 565, by Assemblyman Frank H Lattin, of Orleans County, referred to the Assembly Public Health Committee, is printed here in full

Comment will be made later

#### CORRECTION

The Oneida County Medical Society voted unanimously in favor of the proposed Medical Practice Act, instead of against it as announced in the last issue of this JOURNAL

# Medical Society of the State of New York

## MEETING OF THE COUNCIL

A MEETING of the Council of the Medical Society of the State of New York was held at the State Society rooms, 17 West 43rd Street, New York City, on Tuesday afternoon, December 11th, 1923, Dr Orrin Sage Wightman, President, in the chair Dr Edward Livingston Hunt, Secretary

The meeting was called to order at 2 30 p m and on roll call the following answered to their names Drs Orrin Sage Wightman George M Fisher, Charles O Boswell, Edward Livingston Hunt, Seth M Milliken, Arthur W Booth Edward C. Rushmore, Frank Hernance Lasher Arthur J Bedell, Charles C Trembley, Walter H Kidder, John M Quirk, Harry R. Trick, James N Vander Veer, Henry Lyle Winter, Joshua M Van Cott, Owen E Jones and Mr Oliver, Attorney for the Society

The Secretary presented excuses for Drs E Eliot Harris, Andrew MacFarlane, and Ethan A Nevin

Moved and seconded that Drs Harris MacFarlane and Nevin be excused. Carried

A quorum being present Dr Wightman announced the meeting open for business

Moved and seconded that the reading of the minutes of the last meeting be dispensed with and that they be approved as published in the *NEW YORK STATE JOURNAL OF MEDICINE*. Carried

The Secretary read the following from the Secretary of the Medical Society of the County of New York

December 11, 1923

To the Council of the Medical Society of the State of New York

GENTLEMEN

I herewith respectfully submit for approval, the amendments to the Constitution and By-Laws of the Medical Society of the County of New York adopted, subject to said approval, at the annual meeting November 26, 1923

Respectfully,

D S DOUGHERTY, Secretary

(A) Amend Chapter II Article 2, of the Constitution by changing the word 'in' in line 2 to the word 'of', and by adding after the word 'professional' in line 2 the word 'character', and by adding after the word 'standing' in line 2 the words 'and reputation'. The first phrase of Article 2 as amended would read as follows

"Article 2 The active members of the Society shall be physicians of good moral and professional character, standing and reputation, residing or practicing in the County of New York, duly licensed and recorded in the office of the County Clerk of New York County, "

(B) Amend Chapter I, Article 2, of the By-Laws, by changing the period after the last word to a semicolon, and by adding the following

"Article 2 No applicant of sectarian titles, nor shall any applicant be elected to membership unless and until he shall have established, in a manner deemed sufficient by the *Comitia* Minora, that he is of good moral and professional character, standing and reputation, and that admission would not be prejudicial to the best interests of the Society"

(C) Amend Chapter I of the By-Laws by adding thereto a new article, to be known as Article 12, to read as follows

"Article 12 Any applicant for membership to this Society feeling aggrieved at the action of the Society shall have the right to appeal to the Medical Society of the State of New York "

(D) Amend Chapter VIII of the By-Laws by adding thereto a new article, to be known as Article 14, to read as follows

"Article 14 Any member feeling aggrieved at the action of this Society shall have the right to appeal to the Medical Society of the State of New York."

(E) Amend Chapter XII, Article 2, of the By-Laws, by striking out the entire second sentence of said Article 2, and by substituting in place thereof the following

"Article 2 It shall meet by the Secretary Before reporting favorably upon any application for membership, the Committee shall be satisfied, by proof deemed sufficient by it, that the applicant has complied with the laws of the State of New York relative to the practice of medicine, and that such applicant is of good moral and professional character, standing and reputation, and that his admission would not be prejudicial to the best interests of the Society"

Moved and seconded that the amendments to the Constitution and By-Laws of the Medical Society of the County of New York be approved subject to the approval of the Council Carried

The Secretary read the following letter

War Department  
Office of the Surgeon General  
Washington

November 20, 1923

*The Secretary Medical Society State of New York*

MY DEAR DOCTOR

In order to properly meet the responsibilities of the medical profession of America in the program for national defense, it is necessary to accomplish the enrollment of all eligible men of the profession in the Medical Section of the Officers' Reserve Corps

I am sure it is obvious to you and the members of the society of which you are a member, that the organization of an adequate medical reserve contemplates and requires the support and encouragement of all members of the profession

The advantages of enrollment and classification in time of peace of the body of the profession are conspicuous and include an avoidance of a repetition of the majority of the inequalities and defects which developed as result of our state of unpreparedness for the World War

It is the desire of the War Department to organize and develop the Reserve Corps so as to provide recognition by promotion in grade and assignment to function in organizations in time of peace which will entail the minimum imposition of hardships on men called to active duty in emergency and will insure military efficiency

In order that a better understanding of Reserve Corps affairs may be developed in medical societies it is proposed that a military committee be appointed in each society

The purpose of this committee will be

(a) To establish and maintain contact with the War Department through the Surgeon General

(b) To promote the organization of the Reserve Corps by procurement of enrollments therein

(c) To receive information from the War Department in connection with the Reserve Corps and to convey the same to the society

(d) To convey the recommendations of the society for the improvement of the organization and training of Reserve Officers

In brief, to establish an agency for the development of a more intimate association between the members of the profession and the War Department

The organization of the Medical Section of the Reserve Corps is an outstanding obligation of my office and since proper organization of the medical men of the country for its defense program is a problem which concerns and, I am sure, interests each member of your society, I am asking a

continuance of your support and suggest if appropriate that the proposed liaison be effected

It is requested that this matter be brought to the attention of your society and if it is considered appropriate to organize a military committee that this be done and the names of the committee be furnished me

Very truly yours,

M W IRELAND, *Surgeon General*

Moved and seconded that a Military Committee to consist of one representative from each District Branch be appointed by the Chair Carried

The Chair appointed the following committee  
First District, Edward R. Maloney, New York City, Second District, Walter A. Sherwood, Brooklyn, Third District, Erastus Corning, Albany, Fourth District, Edward N. Packard, Saranac Lake, Fifth District, William Hale, Jr., Utica, Sixth District, Arthur W. Booth, Elmira, Seventh District, Charles O. Boswell, Rochester, Eighth District, Nelson G. Russell, Buffalo

The President read the following letter

December 7, 1923

DR ORRIN S. WIGHTMAN, *President*

*Medical Society of the State of New York*

DEAR SIR

In the closing days of the last Congress a bill for classifying all Government Employees, known as the "Reclassification Bill," was passed and made a law

In order to make this provision effective a Board was established for the purpose of allocating the employees in Government Service to their proper grades. The allocations have now been made, but must be referred to Congress for approval

We find that Nurses, who heretofore have been in the professional class, have been allocated to the "Sub-Profession or Non-Professional class"

Will you, in the interest of high standards of nursing, which is and always has been considered a "Profession," use every influence to the end that Nurses will be classified as "professional"?

Respectfully,

ANNA B. DUNCAN, R.N.,

*Chairman of Legislative Committee, New York Hospital, Alumnae Association*

Moved and seconded that it be referred to the Executive Committee for investigation Carried

Moved and seconded that no member of the State Society be entitled to malpractice defense by the State Society until he has filled out an official application for defense, had it signed by the Secretary of the State Society and filed with the Counsel Carried

The President stated in accordance with request received from Dr Leland E Cofer Director of the Division of Industrial Hygiene of the Department of Labor, permission had been granted Dr Cofer to use the mailing list of the State Society to send out a circular letter to the members enclosing a questionnaire asking for information concerning the number of diseases coming under their care during the past year caused by industries, but without endorsement by the State Society

Moved and seconded that Dr Wightman's action be approved. Carried

Dr Wightman stated that on invitation from Governor Smith a small committee from the State Society consisting of Drs Phillips, Dougherty, Kopetzky and himself, had met with Dr Downing Assistant Commissioner of Education, and Dr Nicoll, Commissioner of Health, in the Executive Chamber at Albany and held a conference relative to the amendment to the Medical Practice Act.

At this conference the facts were brought out that it was over forty years since there had been any survey of the Doctors in New York State and also that the Medical Profession was almost the only profession in the State which did not

have an annual registration. Dr Wightman stated that he had gone to Albany very much opposed to annual registration, but when he heard the facts presented by the Department of Education, he realized that a yearly certification of physicians was necessary in order to determine who were and who were not legally licensed physicians in the State

A general discussion followed in which the members of the Council concurred in Dr Wightman's opinion

Moved and seconded, that from recent developments, it is our judgment that the annual registration law, as presented, is the most valuable and feasible plan for amending the Medical Practice Act

In view of these facts, we are presenting the annual registration act to the County Societies for their approval. Carried

Moved and seconded that this resolution be sent to the Presidents of each District Branch, to bring to the attention of their County Societies. Carried

There being no further business, the meeting adjourned

EDWARD LIVINGSTON HUNT,  
*Secretary*

## COUNTY SOCIETIES

### BRONX COUNTY MEDICAL SOCIETY

A regular meeting of the Bronx County Medical Society was held at Concourse Plaza, on January 16, 1924 and was called to order at 9 P M, the President, Dr Podvin, in the Chair

The following candidates were elected Isaac B Brodsky, Benjamin Finesilver, Abraham J Fleischer, William Sargent Ladd, Rebecca T Roman

Dr Henry Roth read a letter from the Association for the Relief of Needy Physicians of Central and Eastern Europe and urged the co-operation of the members of our Society

Dr Gitlow moved the adoption of the following proposed amendments to the By-Laws

Section 7—OFFICERS Add "a Corresponding Secretary" after "the Secretary"

Section 11—COMMITTEES Add "the Corresponding Secretary" after "the Secretary"

Section 34—SECRETARY Add "The duties of the Corresponding Secretary shall be to assist the Secretary"

Dr Edward C Podvin the newly inaugurated President, addressed the Society as follows

"For many years the feeling has been constantly growing that a County Medical Society should mean more than a purely scientific body. With the development of the specialties have come the special societies or sections in which

men can follow that particular branch which in the main commands their interest. This is eminently proper, as no one society could hope to so arrange its progress that it could keep abreast of all the advances in the different subdivisions of Medicine and Surgery in their most minute detail

"But aside from our personal or special leanings or inclination toward special fields and branches, there are still many common grounds upon which as physicians we all can meet, and as the County Society is the parent organization, in order to direct its activities one needs but to study the requirements of the members in general. From a scientific standpoint the purpose of such a Society should be to place before its members the advances and fundamental principles of progress on the broad and embracing subjects, such, for example, as that which we will take up this evening, Tuberculosis, leaving to the special societies the finer development of technique and minutiae that would be of interest only to the few working in that particular field. It should, therefore, be the object of this Society to bring before its members a clear and understandable presentation of those fundamental subjects which are of interest to all and without an understanding and knowledge of which no man is competent to practice even the most narrow and circumscribed branch of our profession. I or I do not believe

that any man is properly qualified nor will he ever attain eminence in any specialty who does not possess a broad knowledge of, and who does not keep constantly in touch with, the progress made in all the general fields of our profession. The remark that is sometimes made that the program does not interest us because it does not happen to touch our special line of endeavor is usually a thoughtless one, as without a comprehensive knowledge of all branches of medicine no man can hope to cope successfully with the problems which daily confront him in his own particular work.

"And so, from a scientific standpoint, I maintain that the County Society has a field peculiarly its own, fulfilling a demand that cannot be met by the special societies, but which is absolutely necessary for the rounding out and broadening of our views.

"There is, however, another and perhaps equally if not more important field in which the County Society stands alone and that is in the advancement of the social and economic relations of the profession. It is possible to derive our scientific knowledge from reading, though rarely accomplished, but in no other way can we make life more agreeable and practice more profitable than by a united and forward-looking profession. Most of us here were thrilled by the inspiring address of the President of the Medical Society of the State of New York, Dr. Wightman, on the necessity of unity, delivered at our banquet. One could not but be impressed with the keenness of his vision and the sincerity of his purpose in placing before us those two essentials of accomplishment, namely, that we must be constructive and above all we must be united. To my knowledge there is no other unit so well adapted to bring about our solidarity than the County Society, there is no place better suited to discuss and formulate our program for advancement.

"In my opinion the aim of the County Society should be that of a Social and Scientific Center for all the properly qualified members of the profession within its jurisdiction, and I confidently hope that the day is not far distant when this Society will become such a Center with a building designed to accommodate all its activities, where the general meetings, the section meetings, the library and all other activities may be housed. Here the highest type of service might be developed along social-economic as well as scientific lines.

"If time would permit me I might dwell at great length on the many activities that well might engage our attention, such as the development of constructive legislation for the betterment of our members, providing means for social enjoyment and recreation, the establishment of health, accident and other forms of insurance, con-

tributing to or maintaining places for the care of the aged and incapacitated members, post-graduate courses, etc.

"I hope to see the time when the roster of the Bronx County Medical Society will contain the name of every practitioner within its limits and I would favor some plan whereby the young man coming out of the hospital should be received immediately into our fold without formality and without expense to him, that he should serve a sort of apprenticeship of two or three years during which he might receive the social and scientific privileges of the Society, though not a voting member or being required to pay the full amount of dues. Later, having passed through the stage of his early financial struggles and having given evidence of proper qualification, he should automatically be advanced to full membership. Later on after having served as active member for twenty or twenty-five years, or sooner if by reason of incapacity for work or retirement from active practice, he might again enter the inactive class.

"Such an organization might well assume the duties of a quasi-official body in so far at least as keeping the roster of the legally qualified practitioners residing within its confines. In this respect we might well emulate the zeal of the official organization of our sister profession, the Bar Association, for who has not read with tear-dimmed eye the sad plea which it makes for its self-sacrificing judges who are unable to maintain themselves on the meager pittance of \$17,500 per annum, especially when we recall with complacency the princely salary of our own hospital physicians?

"If I may be permitted just for a moment to trespass upon the field of my predecessor, Dr. Lerner, who at the end of a most successful administration is unable to be with us on account of ill health, I would like to call attention to what I think are the two outstanding features of the last year and are evidence of the progress of our Society. First, the establishment of a Bulletin, which I am sure is destined to play a very important part in our history and for which we owe a great debt of gratitude to Dr. Eichler and his zealous co-workers. Secondly, the bringing to a successful issue of the very enjoyable and splendid function which marked the tenth anniversary of our organization.

"In conclusion, I desire to apologize to the Society for this fragmentary and disjointed discourse which I offer as an inaugural address, the work connected with the banquet together with the fact that we have a very distinguished speaker to listen to tonight convinces me that having listened to me with patience thus far my desire that my remarks might be shortened will become unanimous.

"I cannot close, however, without expressing the heartfelt appreciation which I feel for the great honor which has been conferred upon me by electing me to this high office and pledging on behalf of all the officers, as well as myself, our most earnest endeavor to whatever lies within our power for the furtherance of the best interests of the profession. Asking you to bear with us, especially at the meetings where, on account of the multiplicity of the matters that come before us and the brief time allotted the presiding officer may often seem impatient and even abrupt, assuring you that while we realize that we will make many mistakes they will be mistakes of the head and not of the heart."

#### THE SCIENTIFIC PROGRAM

"Tuberculosis," Allen K. Krause, M.D.

Lecture 1—"The Evolution of Tuberculosis Infection"

Lecture 2, on "Points on Diagnosis," will be delivered by Dr. Krause on January 23d and Lecture 3 on "Essentials in Treatment," on January 30th, at 8:30 P. M.

#### THE MEDICAL SOCIETY OF THE COUNTY OF NASSAU

The meeting of the Society held on December 18, 1923, was attended by 53 members. The following physicians were elected to membership: George S. Reiss, Long Beach, W. T. Chamberlain, Hempstead, G. H. Cox, Glen Cove, M. B. Green, Freeport, and R. R. Gallone, Roslyn Heights.

Resolutions were adopted on the death of our late Secretary-Treasurer Dr. Cooley, and a copy of these resolutions has been suitably engrossed in book form for presentation to the family of Dr. Cooley. A copy has also been sent to the State Society in New York.

The members were urged by the Legislative Committee to get in touch with their legislators relative to pending bills. It was stated that the Medical Practice Act would be reintroduced with good chance of passing because of the recent agitation against illegal practitioners.

The tuberculosis campaign was reported to be exceeding its quota, with \$25,000 in sight.

The paper of the evening was read by Mr. J. L. Neff, being the report of a survey of Nassau County made by a special committee to determine the hospital facilities and needs of the county. This report was followed by a lively discussion, which eventuated in its unanimous adoption, with special attention to the formation of the committee called for in the report to formulate ways and means to secure relief from the situation which was disclosed. This

committee is now being formed and will consist of prominent laymen as well as members of the Society.

The January meeting was held on January 29 and was attended by 26 members. The following were elected to membership: Alice K. Higgins, Rockville Centre, J. Elmer Cummins, Freeport, John F. Donohue, Oyster Bay, James J. Shea, Hicksville, D. Dudley Krupp, Freeport, Edwin C. Brannard, Glen Cove, and Alfred Bell, Freeport, by transfer from the Kings County Society.

The Society went on record as being opposed to the theory of re-registration as outlined by Dr. Vander Veer. It adopted a resolution urging the reintroduction of the Medical Practice Act as introduced last year.

The Society endorsed the efforts of the Nassau Hospital Association in attempting to secure additional funds to support that institution in the excellent work it has been doing.

Approval was voted of the suggestion of the American Red Cross, Nassau County Chapter, to start a health center for pre-school children.

The paper of the evening was read by Dr. Robert L. De Normandie, of the Boston Lying-In Hospital, on "The Cesarean Section" in which he deplored the present abuse of this operation. The paper was very warmly received and was listened to and discussed with marked interest.

#### THE MEDICAL SOCIETY OF THE COUNTY OF WASHINGTON

The special meeting held January 21st, 1924, at the County Court House, Hudson Falls, was called to order by the President at 2:30 P. M.

The following were present members: Drs. Casey, Park, Prescott, Pashley, LaGrange, Munson, Heath, Orton, Fortune, Paris, Banker, visitors, Drs. James N. Vander Veer, Harold Rypins, V. D. Sellick.

President stated that the object of the meeting was to discuss the proposed registration law, the increased state assessment and liability insurance.

Dr. Vander Veer gave an extensive résumé of the various bills now before the Legislature that are of interest to the medical profession.

Dr. Rypins, from the State Department of Education, gave a résumé of the general features of the yearly registration bill and his opinion as to how it would work out.

Dr. Pashley moved that the Society favor the general features of the bill, seconded, carried.

An amendment was added that a copy of the motion be sent to our representatives.

# THE DAILY PRESS

*Editor's Note* People generally are becoming more and more interested in health matters if we may judge by the amount of space that is given to notices of medical topics and those of an allied nature. The daily press is especially interested in the doings of lay organizations for the prevention of disease and the promotion of health. We choose the following notices from our clippings for the week ending January 28th

The Brooklyn *Standard Union*, January 26th, carries a letter from Hon Bird S Coler, commissioner of the Department of Public Welfare, saying that the ranks of the Brooklyn doctors are being depleted so that now there is one physician to 780 inhabitants, a proportion lower than that in most other important cities. The remedy which Commissioner Coler suggests is to secure more medical students, and to add to the capacity of the Long Island College Hospital Medical School and form a Brooklyn University which shall include the Medical School. He would also extend the plan of teaching clinics which has been instituted by the Joint Committee on Graduate Medical Education which has been formed by the Medical Society of the County of Kings and the Long Island College Hospital.

From Rochester come notices of the meeting of the Monroe County Tuberculosis and Public Health Association and of preparations for a survey of health accomplishments among the 480 children who are members of the nutrition classes. One child was reported to have gained seventeen pounds in five weeks. Rochester has always been at the front in civic organizations for the promotion of health.

The Watertown papers report the opening of a building to house the public health center. It is a memorial to the soldiers of the World War, and will house the child welfare work, the tuberculosis clinic, the dental clinic, the Red Cross, and a diet kitchen—a parking space for baby carriages in the basement was stressed by the newspapers. The building cost about \$45,000, most of which was raised by the Visiting Nursing Association.

The Rochester newspapers have been carrying accounts of the additions of iodide of potassium to the city water in order to prevent goitre. One paper reports protests from home brewers who

fear that the iodine will act as an antiseptic in their brews. The St Paul *Pioneer Press* discusses the use of iodine and thinks the cost prohibitive, but in place of iodine it carries a recommendation from a local doctor that a form of iodine be added to chocolate candy and sold to school children at one cent a stick.

From Syracuse comes an account of an address of Health Commissioner Thomas P Farmer before the Exchange Luncheon Club. Dr Farmer warmly commended lay organizations for creating public sentiment in favor of better health conditions. He said that the city needed larger appropriations in order that it might extend its survey of housing and living conditions, and he mentioned the good work which was being done by workers under the Milbank fund who are spending over \$100,000 a year in making a demonstration of intensive work along public health lines. He said the city had only four deaths from typhoid last year, and that 75% of the city milk supply was pasteurized.

Several papers throughout the State comment on the use of serums from recovered cases for the prevention of measles and scarlet fever. The Syracuse *Herald* of January 25th carries a request by Health Commissioner Farmer that each adult who has recently recovered from measles be asked to donate eight ounces of blood to be used for the prevention of exposed children whose lives would be in danger if they should develop measles. The Brooklyn *Standard Union* prints extracts from the City Department of Health Bulletin describing the serum treatment and giving figures to show the great number of preventable deaths that are caused by measles.

The New York *Times* of January 27th contains an account of an incident which shows a wide interest in the health talks which are broadcasted by the New York State Department of Health. A grandmother of eleven children had heard the radio talks and wrote to know when she could get further information regarding the correction of children's defects which had been described in the radio talks and which she presumed could be found among some of her grandchildren. The radio talks certainly cause people to think.

The New York *Evening Telegram* of January 28th contains a two-column account of the work-

ings of the Health Crusade plan which is promoted by the National Tuberculosis Association. The crusades movement has been introduced into a large number of public schools throughout the United States and in foreign lands. Its principle is that of daily doing certain health chores which have a direct effect on health. The training is like that of a young man who was seeking to become a knight in olden times, and for rewards the pupil rises through the grades, as he does increasingly more difficult chores, until in three or four years he becomes a knight. The movement is a valuable means of interesting children in the promotion of their health.

---

Adults, too, are thinking about the prevention of the peculiar diseases which affect the grown-up, to judge by the account of an address given by Dr. Charles S. Prest, Secretary of the Brooklyn Bureau of Charities, on January 26th, before the Associated Physicians of Long Island. Dr. Prest described the formation of a committee of Brooklyn physicians and hygienists, headed by Dr. Glentworth R. Butler, in order to promote the periodic medical examinations of adults. He also described a course of instruction which has been arranged by the Committee on Graduate Medical Education in order to prepare physicians to make an intelligent physical examination in order to discover defects and diseases in their incipency.

---

Brooklyn seems to be the first community in which the periodic examinations are being promoted in a systematic manner. The demonstration will be watched with interest throughout the country.

---

The local papers of Westchester County carry accounts of the fourth annual meeting of the Westchester County Council for Public Health Nursing held in Mt. Vernon. Westchester County is organized into local public health nursing districts under a central supervision. Dr. Matthias Nicoll, State Commissioner of Health, said that the work was in complete accord with the standards and ideals of the State Department of

Health which is trying to have public health nurses supported by public funds.

---

Dr. I. G. Ramsdell of White Plains spoke on the plan for establishing a County Health officership as a part of the proposed new Charter for Westchester County, but said that the County need not wait for the charter, because the Board of Supervisors already had the power to install the plan as the Board of Cattaraugus County has done.

---

The Buffalo News carries warning about the danger of catching pneumonia which is greater during February than in any other time of the year, still the paper carries no news to indicate that an epidemic is imminent.

---

The Syracuse Telegram carries an editorial regarding the high local death rate from violence, and rebukes the increase in bootlegging.

---

The Southern newspapers frequently carry stories of civic health movements. The Savannah News carries a long description of a meeting of the Health Center, at which public health work in Chatham County was discussed. The paper says that Georgia has 160 counties and only six public health nurses, two of whom are in Chatham County, one of the two nurses is a negro woman, the only colored public health nurse in the state. The report makes a very creditable showing for Chatham County and is a demonstration of what can be done in other places throughout the South.

---

The Augusta, Georgia, papers carry an account of a competition among the school teachers for scholarships offered by the American Child Health Association. The award of scholarships is based on the accomplishment of health work by the teachers.

# BOOK REVIEWS

**DISEASES AND INJURIES OF THE RECTUM, ANUS AND PELVIC COLON.** By J RAWSON PENNINGTON, M.D., F.A.C.S., Proctologist to the Columbus Hospital, Veterans' Hospital No 30, and the United States Marine Hospital. Two plates, 679 illustrations. Published by P. Blakiston's Son & Co., Philadelphia, Pa., 1923. Cloth, \$12.00.

The author has the honor of producing a book unquestionably the work of a scholar and ardent student of medicine. The enormity of his research work in the form of references, biographies, modern and ancient history, and his worship of the fathers of medicine by producing their photographs is most striking.

This book is practically a medical history of his subject, and a tremendous amount of scientific tabulation and reviews is involved, which brings the history of man, of medicine and the treatment of this specialty from the dark ages to the present day and seems only suited as an invaluable reference book.

The book covers the subject thoroughly, is well written and the author is extremely modest. He has, however, permitted his personal opinions to be unhappily buried beneath too many references, the ambiguous opinions of others and irrelevant material which one tries to avoid in reading a present-day medical text-book.

MARTIN L. BODKIN

**A TEXT-BOOK OF CHEMISTRY FOR NURSES.** By FREDUS N. PETERS, A.M., Ph.D., Author of "Experimental Chemistry", Director Laboratories and Professor of Chemistry and Metallurgy, Kansas City Dental College. Illustrated. Second Edition. C. V. Mosby Co., St. Louis, 1923. Price, \$2.50.

This volume is written along a plan quite similar to that followed by the author in his "Applied Chemistry" published last year. Fundamental principles and "laws" of chemistry are clearly presented together with their more common, every-day applications. Chapters are devoted to a discussion of the more important elements and "groups," such as the "lead group" and the "copper group."

The chapter devoted to the more common poisons and the detailed glossary should prove quite helpful to nurses.

FRANK E. MALLON

**WALTER REED AND YELLOW FEVER.** By HOWARD A. KELLY, M.D. Third Edition. Revised. The Norman Remington Co., Baltimore, Md. 352 pages. Price, \$2.50.

It is good to have the story of Walter Reed and his ilk kept fresh in our minds and Dr. Kelly's work now reaching its third edition does just that thing, adding as well the story of General Sternberg's life and that of the late General Gorgas, thus associating in one volume the lives of three of the great quartette (Noguchi, the fourth, still living) whose work abolished from the list of hideous plagues, one of the most deadly—yellow fever.

W. S. H.

**PRACTICAL ANESTHETICS FOR THE STUDENT AND GENERAL PRACTITIONER.** By CHARLES F. HADFIELD, M.B.E., M.A., M.D. 12mo of 244 pages. Illustrated. William Wood & Co., New York, 1923. Cloth, \$3.00.

For the American reader books of this sort would be more attractive if written with the cis-Atlantic background, unfortunately such can be counted on half the fingers of one hand. English writers have been more

prolific of brain-children. In this instance the need of a smaller book than either Flagg's or Gwathmey's is very evident, for as illustration, of the thirty-two illustrations barely three are not of distinct English apparatus—as was to be expected.

The first interesting feature is the first place given to Nitrous Oxid. The usual sequence is Chloroform, Ether and last Nitrous Oxid. This is a deserved recognition of the new practice. The author expresses the curious hope that "it may not prove impossible to devise some form of apparatus by which the nitrous oxid exhaled gas can be collected, purified, and used again and again for the same patient." He describes a modification of a well-known American apparatus but fails to point out the modifications. I am sure Dr. Foregger, the manufacturer, would have been glad to furnish an electrotpe of the original. It is naively stated that "there should never be any secrecy when ether is used!"

The expression "mitigated ether" is employed for mixtures of chloroform and ether. Hadfield's preference and recommendation is 15 to 1 (McCardie is more United States with 16 to 1). He likes an "open method" but recognizes its limitations, hence advises N<sub>2</sub>O or Ethyl Chlorid as suitable complements. "the sequence ethyl chloride, closed ether, open ether, is the best that can be found for routine use in ordinary cases."

We like this little book because it is well written from the standpoint of clinical experience. The short chapter on Emergencies at the end, and the introductory longer first chapters on General Considerations, Signs and Stages, and Respiration, are right to the point. Even the lay woman, who is so unobtrusively prominent these days, can read these chapters with profit. A. F. E.

**THE BIOLOGY OF DEATH.** By RAYMOND PEARL, Johns Hopkins University. Being a Series of Lectures Delivered at the Lowell Institute in Boston in December, 1920. J. B. Lippincott Co., Philadelphia and London, 1922.

Raymond Pearl's "Biology of Death" is a most fascinating and instructive book. In it there is food for thought for Biologist, Physician, Public Health Worker, Sanitarian and Social Economist alike.

He begins his book with a discussion of the life of the cell. He refers to the experiments of Carrel, in which the cells of living tissues grew and reproduced for many years when incubated on artificial media. The opinion is expressed that the cell itself is immortal and he gives as an example of this cellular immortality of the unicellular organism, the case of amoeba which goes on multiplying indefinitely.

Death, according to Pearl is only a characteristic of the multicellular and more highly specialized organism, and is due not to the death of the individual cell, but to the break in the harmonious co-operation which must exist between the various groups of cells. Thus, if the cell group which is excretory in function (kidney) becomes impaired or dies, the whole animal dies, or if the heart breaks down or any other vital organ ceases to function, the whole organism dies. This is different from the conception of death of an organism due to senility or the gradual and simultaneous break down and aging of all of the component cells of the animal.

According to the author, death due to senility in this sense practically never occurs. Then he reviews the causes of death and finds that diseases of the gastrointestinal tract contribute most largely to the infant mortality rate, and that pulmonary disease, tuberculosis and

pneumonia are the most potent factors in the production of mortality rate throughout youth and young adult life. During middle life (from 40-60) cardiovascular and renal diseases produce the highest death rate and beyond this the causes of death are manifold and difficult of classification. Embryologically speaking the least resistant to bacterial infection and general wear and tear of life are the ectodermal structures the lungs and the alimentary system. Next in importance come the mesodermal structures the cardio-renal system, and the most resistant of all are the ectodermal organs namely the central nervous system and the skin. It is comparatively seldom that the disease of the latter causes death.

The next important question which the author raises is what determines the life span? In the most logical fashion he concludes that heredity is the most important factor and that environmental factors assume but a subsidiary and secondary role. In his discussion on the question of heredity he points out the very interesting fact that the increase in the life span of the individual in the last half century is not the result of the public health measures and the crusade against infections notably tuberculosis, etc. but is true to the general decline in the death rate occurring all over the world, both in the diseases which have and those which have not any relation with sanitary or public health measures. In other words, that there is some biological reason quite different from the preventive measures now employed which is responsible for the universal reduction in mortality rate. He gives as examples mortality curves of the countries having the best and those having the worst sanitary conditions, and finds that the general mortality curves are quite parallel.

Another one of the very interesting revelations in the book is the fact that the mortality rate among the wealthy classes and the poverty stricken is not very different and that while external or environmental conditions may play a part in the production of morbidity or disease, the mortality rate which is an inherent biological characteristic of the organism is not definitely altered by reason of social status.

His final remarks deal with the question of Public Health and he shows that the population of the world is generally on the incline. In other words that the birth rate exceeds the death rate. In some countries it is more striking in others it is less so.

Inasmuch as a given area of the earth can only maintain a certain maximum of inhabitants if this increase in population is to continue, there must come a time when some very serious problems must arise. At the present time there are countries in which the population is excessive for its area, but where the necessities of life can still be met with by the purchase of the surplus from other less densely populated countries. If the increase in population continues there must come a time when this will be impossible. It is hardly to be wondered therefore, that we have very serious minded individuals who advocate such measures as birth control or some who even speculate on the derivation of synthetic foods from the atmosphere or elsewhere.

All in all it must be confessed that there is found in this little book a wonderful array of facts which are stimulating to everyone interested in biological problems.

C. S. DANZIE

HISTORY OF THE GREAT WAR BASED ON OFFICIAL DOCUMENTS—MEDICAL SERVICES. Edited by Major General Sir W. G. MACPHERSON K.C.M.G., C.B., LL.D. Major General Sir W. B. LEISHMAN K.C.M.G., C.B. F.R.S., LL.D., and Colonel S. L. CUMMINGS C.B., C.M.G., LL.D. London His Majesty's Stationery Office, Imperial House, Kingsway,

W. C., 2 1923. Octavo of 600 pages illustrated. Cloth 21s. 9d.

The volume of the series is deserving of extended review. It is a valuable contribution to medical literature consisting of special articles by eminent British physicians among which one notes such distinguished names as Adams, Leishman, and Eir, Almoth Wright. These men were the heads of the Pathological Service of the British Army. The medical problems they met and solved during the war were on the same vast scale as the military problems. In these articles they tell how they solved them and also found time for much original research.

Chapter 1 gives a résumé of the organization of the Pathological Service in the British Army before and during the war. It is interesting to note there was no central control of this service, that from 1903-14 but 59 officers qualified as specialists in bacteriology and that there were but 8 appointments at home and 3 abroad. The war demonstrated the importance of the service which pathology could and did render. This chapter tells how the British expanded the service to meet demands.

Chapter 2 on the physiology of wounds is in many ways the most interesting and instructive. In 1914 the consensus of military and medical opinion was that medical progress had almost eliminated the badly infected wound. However in the first year of the war, the impossible happened, the hospitals were swamped with terribly infected wounds the surgeons were confronted with a septic disaster of undreamed of proportions. As Keogh said "We have in this war gone straight back into all the septic infections of the Middle Ages." Investigation showed the trouble to be due chiefly to delay in operation and the heavily infected and fertilized soil of Europe. Sir A. Wright was led to turn his original genius to the study of infected wounds. In the Research Laboratory at Boulogne, he made an experimental study of wounds and recommended a method of treatment based upon the phenomena he discovered. The story of this research should be read by all surgeons for Wright's laws are equally applicable to civil surgery.

One can only mention the subsequent chapters on gas, gangrene, anaerobic infections, tetanus, enteric fevers, dysentery, typhus, cerebrospinal fever, influenza, trench fever, war nephritis, encephalitis, etc. The war brought vast opportunities for pathological research, and pathology proved itself of indispensable value. These articles are packed with information yet the story they tell of conquest of the bacterial scourges of war has a dramatic quality that makes most interesting reading.

E. B. SMITH

HISTORY OF THE GREAT WAR BASED ON OFFICIAL DOCUMENTS—MEDICAL SERVICES. DISEASES OF THE WAR. Volume 2. Edited by Major General Sir W. G. MACPHERSON, K.C.M.G., C.B., LL.D., Major General Sir W. P. HERRINGTON, K.C.M.G., C.B. Colonel T. R. ELLIOTT, C.B.E., D.S.O., and Lieut.-Colonel A. BALFOUR, C.B., C.M.G. London His Majesty's Stationery Office, Imperial House, Kingsway W. C., 2, 1923. Octavo cloth 26 shillings.

This volume compiled by the British Government of the series of the diseases of the war presents the reports and conclusions of those officers who cared for the nervous conditions arising among the soldiers the medical aspects of aviation, and gas warfare. It is a complete presentation of these subjects and gives one some idea of how these new problems of the war were met. All conditions are here given together with the treatment. It is an instructive volume and should be studied by all who may be interested.

H. M. M.

**THE FORM AND FUNCTIONS OF THE CENTRAL NERVOUS SYSTEM** By FREDERICK TILNEY, M.D., Ph.D., Professor Neurology, Columbia University, Consulting Neurologist, Roosevelt Hospital, and HENRY ALSOR RILEY, A.M., M.D. Foreword by George S. Huntington, Sc.D., M.D., Professor Anatomy, Columbia University. Second edition, 591 figures, 763 illustrations, 56 colored. New York: Paul B. Hoeber, 1923. Priced, \$12.00.

The first edition of the above work appeared in 1921. The demand has been sufficient to exhaust the first printing and to compel a new edition after only two years. Because of this short lapse of time, the authors state that they have made no material changes in the book beyond the correction of typographical errors. The index has been slightly enlarged.

**THE PRACTICAL MEDICINE SERIES, COMPRISING EIGHT VOLUMES ON THE YEAR'S PROGRESS IN MEDICINE AND SURGERY** Under the General Editorial Charge of CHARLES L. MIX, A.M., M.D. Volume I, General Medicine. Edited by GEORGE H. WEAVER, M.D., LAW-RASON BROWN, M.D., ROBERT B. PREBLE, A.M., M.D., BERTRAM W. SIPPY, M.D., RALPH C. BROWN, B.S., M.D. Chicago, Ill., The Year Book Publishers, 1923.

This series is well established and well known as a system of reviews of the year's progress in the various departments of medicine. This volume on "General Medicine" is edited by George H. Weaver, Lawrason Brown, Robert A. Preble, Bertram W. Sippy, and Ralph C. Brown, men of standing in their respective fields. The text is divided into four parts, of which the first is given over to Infectious Diseases, Endocrinology and Diseases in Lower Animals. The second section deals with Diseases of the Chest, the third with Diseases of the Blood and Bloodmaking Organs, of the Heart and Bloodvessels and of the Kidney, while the fourth takes up Diseases of the Gastro-Intestinal Tract, of Metabolism, of the Liver and Gallbladder and of the Pancreas.

As usual, there are numerous editorial footnotes which contribute one of the most valuable features in this system of handbooks.

W. H. D.

**BÉCHAMP OR PASTEUR? A LOST CHAPTER IN THE HISTORY OF BIOLOGY** By E. DOUGLAS HUME. Founded upon M.S. by MONTAGUE R. LEVERSON, M.D. (Baltimore), M.A., Ph.D. With a Foreword by S. JUDY LEWIS, D.Sc., F.I.C. Covici-McGee, Chicago, 1923.

This little book is ostensibly a plea for greater recognition of the genius of Antoine Bechamp, a brilliant chemist and physician who was contemporary with Pasteur. It consists chiefly, however, of a savage attack upon Pasteur personally, his work and the medical profession at large—an attack having all the marks of anti-vivisectionist propaganda.

One must credit the author with being an able advocate for Béchamp, who appears, in these pages, as a gentleman, a worker of extraordinary energy, a prolific and lucid writer and a great scientist who has not received due recognition. His claim to priority over Pasteur in research on fermentation and silk-worm diseases appears a good one and the latter seems to have used him shabbily on several occasions. However, one feels sure that Bechamp, if living, would now retract or modify his microzymian theory and be the first to resent the use of his name in this vicious attack on medicine.

Two-thirds of the book are devoted to an arraignment of Pasteur personally, an attempt to discredit the germ-theory of infectious disease, claims that the use of biologicals has increased disease incidence and accusations of commercialism against the medical profession. The author knows nothing about bacteriology, yet tries

to prove that bacteria are a product and not a cause of disease. He quotes voluminously from sources of no scientific value and distorts extracts from good authority to prove his argument.

Written with apparent sincerity, almost with fanaticism, this book contains a plausible argument based upon false premises. It is undoubtedly propaganda intended for lay consumption, it will, no doubt, convince many readers and thus do its share of harm.

E. B. SMITH

**THE RIDDLE ON THE RHINE, CHEMICAL STRATEGY IN PEACE AND WAR.** By VICTOR LEFEBURE, Officer of the Order of the British Empire (Mil.), Chevalier de la Legion d'Honneur. With a preface by Marshal Foch and an introduction by Field Marshal Sir HENRY WILSON, Bart., Chief of the Imperial General Staff. New York, E. P. Dutton & Company, 1923.

In this book the author outlines the salient points in the development of chemical warfare, its causes, results and future. The chief cause of the chemical war, which played so prominent a part in the recent world conflict, was an unsound and dangerous world distribution of industrial organic chemical forces. As a safeguard against a similar catastrophe in the future the author would have the League of Nations suppress many of the munition factories still existing in Germany and also decentralize the organic chemical establishments now operating in that country, for such establishments would have dangerous potentialities in the event of another war.

As far as the complete elimination of chemical warfare itself is concerned the author is not very optimistic. Until universal peace is fairly well implanted he recommends that research and training in chemical protection be continued by keeping abreast with offensive chemical warfare.

The book is a post-war propaganda volume of an intensely anti-German character.

FRANK E. MALLON

**PRACTICAL LOCAL ANESTHESIA AND ITS SURGICAL TECHNIQUE** By ROBERT EMMETT FARR, M.D., F.A.C.S. Octavo of 529 pages with 219 engravings and 16 plates. Philadelphia & New York: Lea & Febiger, 1923. Cloth, \$8.00.

This book is, without question, the most practical one that has ever been published in this country on local anesthesia. It is divided into three parts. Part I describes anesthetics, equipment, technique and a description of the sensory nervous system. Part II takes up the subject of local anesthesia regionally, all parts of the body being considered except the abdomen. Part III discusses in detail local anesthesia in surgery of the abdomen.

Not only is this profusely illustrated book a great aid in the best and most practical method of producing local anesthesia, but contains many very helpful suggestions in surgical technique and surgical strategy. Instruments invented by the author and the methods of using them are described in detail.

We feel that Dr. Farr is to be congratulated for his great effort in giving the Profession this wonderful book, and also that every progressive physician should read it and become familiar with the possibilities of local anesthesia and how to accomplish them.

J. M. SCANNELL

**PRACTICAL MORPHOLOGY: A Handbook for the use of Students and Practitioners.** By ROBERT DONALDSON, M.A., M.D. Octavo of 364 pages. London: William Heinemann, 1923. Cloth, 15 shillings.

This work embodies a new departure of the study of gross and microscopic histology and pathology. Instead of taking it for granted that the student possesses a mind picture of the normal structure of the body,

the author pictures the normal histology for the reader in a short resume preceding the pathological description. As a whole, the book should prove a very handy help beside the microscope. The descriptions are concise, understandable and complete, and promise to be a very valuable asset to those who work in the domain of tissue pathology.

MAX LUDWIG.

**ORTHOPEDIC SURGERY.** By SIR ROBERT JONES, K.B.L. CB, and ROBERT W. LOVETT, M.D., F.R.C.S. Octavo volume of 699 pages with 712 illustrations. William Wood & Co. New York, 1923. Cloth \$9.00.

This comprehensive work on Orthopedic Surgery is a collaboration of Sir Robert Jones of England with Robert W. Lovett, Buckminster Brown Professor of Orthopedic Surgery in Harvard University. Both of these names are well known in the medical profession and do not need an introduction. As a result of the combined work of these two gentlemen we have the best thought both of England and the United States in this division of medicine in a single text.

The text consists of seven hundred pages and is well arranged. A consideration of anatomy, physiology and pathology of joints is first given followed by a chapter on the traumatic affections of joints in general. Some eight pages are given to dislocations of specific joints other than disease and includes adhesions and ankylosis, a very valuable portion of the book. Tuberculosis is considered at length with a broad exposition of treatment.

Arthritis deformans, pyogenic infections of joints and the more unusual affections of bones and joints follow.

The chapter on anterior poliomyelitis is excellent and very complete with a fair consideration of operative procedure. Under the head of congenital deformities the principal deformities are considered only such as club foot, dislocation of the hip, torticollis and elevation of the scapula.

The last one hundred pages are given over to static deformities and disabilities.

The authors have produced an excellent text book for the student and the doctor, well illustrated and well arranged. The publishers' work is very well done and is a whole establishes a standard text on this subject.

J. C. R.

**TRY POST GRADUATE LECTURES DELIVERED BEFORE THE FELLOWSHIP OF MEDICINE AT THE HOUSE OF THE RIVAL SOCIETY OF MEDICINE 1919-1920.** Octavo of 266 pages. William Wood & Co. New York, 1922. Cloth \$3.50.

In this volume of ten post graduate lectures before the Fellowship of Medicine, we have excellent examples of exegesis by eminent English experts. The topics are timely such as Combined Treatment (Surgery, X Ray and Electricity), 'After Effects of Anesthetics', 'Prognosis of Exophthalmic Goitre', 'Deformities and Disabilities of the Feet due to Paralysis'.

Sir George Savage (now deceased) writes most entertainingly on "Syphilis and Insanity" and "Morbid Mental Growth."

In this year book for 1919-1920 we have a collection of interesting contributions to medical literature.

W. S. H.

## BOOKS RECEIVED

**AN INTRODUCTION TO SURGICAL UROLOGY.** By WILLIAM KNOX IRWIN, M.D., Aberd., F.R.C.S., Edin., Hon. Cas. Out Patient Surgeon St. Paul's Hospital for Genito-Urinary Diseases. William Wood & Co., New York, 1924. Price \$2.50.

**PRACTICAL CHEMICAL ANALYSIS OF BLOOD—A BOOK DESIGNED AS A BRIEF SURVEY OF THIS SUBJECT FOR PHYSICIANS AND LABORATORY WORKERS.** By VICTOR CARL MYERS, M.A., Ph.D. Professor and Director of the Department of Biochemistry, New York Post Graduate Medical School and Hospital. Second Revised Edition. Illustrated. C. V. Mosby Company, St. Louis, 1924. Price \$4.50.

**HERNIA. ITS ANATOMY, ETIOLOGY, SYMPTOMS, DIAGNOSIS, DIFFERENTIAL DIAGNOSIS, PROGNOSIS AND OPERATIVE TREATMENT.** By LEIGHTON WATSON, M.D., Associate in Surgery Rush Medical College, Chicago. III. 232 original illustrations by W. C. Shepard. C. V. Mosby Company, St. Louis, 1924.

**MANAGEMENT OF THE SICK INFANT.** By LANGLEY PORTER, B.S. M.D., M.R.C.S. (Eng.), L.R.C.P. (Lond.). Professor of Clinical Pediatrics, University of California Medical School, Visiting Physician, San Francisco Children's Hospital, Consulting Pediatrician, Babies Hospital, Oakland, and WILLIAM E. CARTER, M.D., Assistant in Pediatrics and Chief of Out Patient Department, University of California Medical School. Second Revised Edition. Illustrated. C. V. Mosby Company, St. Louis, 1924. Price \$3.50.

**GERIATRICS. A TREATISE ON THE PREVENTION AND TREATMENT OF DISEASES OF OLD AGE AND THE CARE OF THE AGED.** By MILDRED W. THOMAS, M.D., Editor. Medical Review of Reviews. Associate Editor The Therapeutic and Dietetic Age. With Introductions by A. JACOBI, M.D., LL.D. and J. L. NASCHER, M.D. Second Edition Revised and Enlarged. C. V. Mosby Company, St. Louis, 1924. Price \$4.50.

**FIGHTING FOES TOO SMALL TO SEE.** By JOSEPH McFARLAND, M.D., Sc.D., Professor of Pathology in the Medical Department of the University of Pennsylvania. Illustrated, 64 engravings. F. A. Davis Co., Philadelphia, 1924. Price \$2.50 net.

**INTRAVENOUS THERAPY. ITS APPLICATION IN THE MODERN PRACTICE OF MEDICINE.** By WALTON FORREST DUTTON, M.D. Medical Director Polyclinic and Medico-Chirurgical Hospitals. Graduate School of Medicine, University of Pennsylvania. Illustrated 50 half tones and line engravings, some in colors. F. A. Davis Company, Philadelphia, 1924. Price, \$5.50 net.

**INTRANASAL SURGERY.** By FRED J. PRATT, M.D., F.A.C.S., Assistant Professor Eye, Ear, Nose and Throat Medical School, University of Minnesota, and JOHN A. PRATT, M.D., F.A.C.S., Assistant Professor Eye, Ear, Nose and Throat Medical School, University of Minnesota, Minneapolis. Illustrated 195 half tone engravings. F. A. Davis Company, Philadelphia, 1924. Price \$5.00 net.

**SELECTED ESSAYS ON ORTHOPEDIC SURGERY.** From the writing of NEWTON MELMAN SHAFER, M.D. (University of the City of New York 1867). F.A.C.S. Illustrated. G. P. Putnam's Sons, New York, and London, 1923.

**CLINICAL MEMORANDA FOR GENERAL PRACTITIONERS.** By ALEX. THOMAS BRAND, M.D., C.M., V.D., and JOHN ROBERT KEITH, M.A., M.D., C.M. Second edition. William Wood & Co., 1924. Price, \$3.00.

**GENITO-URINARY DISEASES AND SYPHILIS.** By HENRY H. MORTON, M.D., F.A.C.S. Fifth Edition, Revised and Enlarged. With 328 illustrations and 38 full page colored plates. Physicians and Surgeons Book Company, New York, N. Y., 1924.

### The Chemical Union

JAMES J. MONTAGUE

("Oxygen men should marry nitrogen women"—Dr R. Kendrick Smith of Boston)

Oh, lovely nitrogenous lady,  
Each oxygen atom in me  
With love is aflame, and demands that you name  
The day when our wedding shall be  
Yea! even the tiny electrons  
Of which the said atoms are built  
Would droop in despair if a maiden so fair  
Were to prove a perfidious jilt  
So hark to my passionate pleading,  
Let our hearts and our souls have communion—  
With never a sigh as the years hasten by—  
In a perfectly chemical union  
I wedded, before I had wisdom,  
A maid of the oxygen sort,  
Our marital life was a record of strife  
Which ended, of course, in a court  
Identical atoms composed us  
Our wants were exactly the same.  
It's a fatuous plan for an oxygen man  
To marry an oxygen dame  
We both wanted fat for dinner,  
Unlike Mr Spratt and his spouse,  
And for seven long years, filled with curses and tears,  
Our rows made a wreck of the house  
But you're a nitrogenous maiden,  
Your atoms are friendly with mine,  
For the fat I'll be keen, you'll be strong for the lean,  
And our dinners will all be divine  
We'll dwell in delightful contentment,  
According to chemical law,  
And our joys will increase in molecular peace  
With never the sign of a flaw  
So prithee, accept my proposal,  
Send me word that you'll surely be mine  
We'll be happy through life as a husband and wife,  
For our atoms will get along fine.

Nick—We agree with you that Lally Lax—but what?

Patient—I can't pay that bill. It's too much.

Medic—Well, I'll show you that I'm a good sport  
I'm going to forget half that bill.

Patient—That's fine. I certainly appreciate that favor,  
Doc, and to show you what kind of a sport I am, I'll tell  
you what I'll do.

Medic—What's that?

Patient—Forget the other half.

### Most Effective

"I suppose, Henry," said the old gentleman to his  
new son-in-law, "that you are aware the check for fifty  
thousand dollars I put among your wedding presents  
was merely for effect."

"Oh, yes, sir," responded the cheerful Henry, "and  
the effect was excellent. The bank cashed it this morn-  
ing without a word"—*Vanity Fair*

### Dollars and Sentiments

"Are you engaged to Algernon?" inquired Miss  
Cayenne.

"Yes. I have promised to marry him as soon as he  
makes a fortune."

"That isn't an engagement. That's an option"—  
*Washington Star*

### Remarkable Demises

The ways in which application forms for insurance  
are filled up are often more amusing than enlightening,  
as the *British Medical Journal* shows in the following  
selection for examples.

"Mother died in infancy."

"Father went to bed feeling well, and the next morn-  
ing woke up dead."

"Grandfather died suddenly at the age of 103. Up  
to this time he bade fair to reach a ripe old age."

"Applicant does not know anything about maternal  
posterity, except that they died at an advanced age."

"Applicant does not know cause of mother's death,  
but states that she fully recovered from her last illness."

"Applicant has never been fatally sick."

"Applicant's brother, who was an infant, died when he  
was a mere child."

"Grandfather died from gunshot wound, caused by  
an arrow shot by an Indian."

"Applicant's fraternal parents died when he was a  
child."

"Mother's last illness was caused from chronic rheu-  
matism, but she was cured before death"—*The Chris-  
tian Advocate*

### A Mother's Prayer

May I endeavor now to be  
A modern in maternity,

Instead of pressing to my breast,  
To kick the fledgling from the nest,

Instead of soothing him by night,  
To psychoanalyze his fright—

Frcud! help me seek, instead of love,  
His mother-complex to remove!

V W M, in *Life*

### No Time to Scold

A Boston physician who was on a Western trip with  
his wife wrote home that they would return Monday  
on the 10 P M train. Their two children, aged nine and  
eleven, wanted to meet them, but received very definite  
instructions not to do so.

When the parents arrived at 11 30, their train being  
an hour and a half late, they were surprised to see  
Ernest and Alice waiting for them on the platform.  
The mother hurried forward to expostulate, but was cut  
off by the shrill voice of Alice crying, "Hurry up,  
Mother! Don't stop to talk. The taxi's up to \$7.60  
already"—*Boston Transcript*

## OBSERVATIONS ON LEUKEMIA.\*

By THOMAS ORDWAY, M.D

ALBANY N Y

THE Problem of the Leukemias requires further elucidation, for the leukemias are pathological conditions the specific cause of which is still unknown. It is, therefore, impossible clearly to define the limits and to arrange the accumulation of isolated observations in orderly sequence with the proper conception of cause and effect. I shall, therefore, merely present certain facts which various methods of study have yielded and discuss their possible relationship to the disease. Detailed and critical reviews of the entire subject of leukemia have been published in recent systems of medicine by Vogel and by Gorham and myself among others. I shall therefore, restrict these remarks largely to those phases of the subject to which I have given special attention.

The general conception of leukemia or leucocythemia is that it is a disease of the blood-forming tissues manifesting itself by a marked hyperplasia of these tissues. When fully developed in its classical form it is characterized clinically by a remarkable increase in the number of white blood cells in the blood and by varying degrees of splenic and glandular enlargement. The white corpuscles of leukemic blood vary from the normal leucocytes in many instances and are considered pathological unripe cells which have gained access to the blood stream before reaching maturity. It is not the increased number of white blood cells but their immaturity which distinguishes leukemia from leukocytosis.

Increased knowledge has forced us to amplify this definition of the classical leukemia for there are cases in which the blood picture suggests leukemia, and yet autopsy shows no evidence of leukemia. These cases may be considered as instances of an unusual response of the blood-forming tissues to infection. On the other hand cases are seen in which the blood picture is sub-leukemic or even relatively normal and yet autopsy reveals leukemic changes in the tissues. It is evident therefore, that the essential point in the diagnosis of leukemia is the hyperplasia

of the leucocyte producing tissues and not the presence of an excessively high white count, nor the discovery of a certain percentage of abnormal white cells which differentiate it from ordinary leukocytosis. The distribution of this cellular hyperplasia may vary in the individual case but it has the same general characteristic in all.

Our present point of view considers leukemia as consisting of several states rather than a single picture and so the condition has been termed "leukemic states." All of these states, however, are consistent in showing histological evidence of leukemic hyperplasia. Clinically and hematologically there may be extreme variations from the generally accepted picture of hyperleukocytosis, enlarged spleen and lymphatic glands. Such a concept would include, therefore, the leukemic, subleukemic and aleukemic myeloses and lymphoses.

Clinically there may be a very close similarity between cases of so-called purpura hemorrhagica, scurvy, grave anemias, particularly of the aplastic type, and certain cases of leukemia, notably the acute leukemias or the acute exacerbations of the chronic variety. It is not infrequent that histological evidence and even special stains are necessary to arrive at the correct conclusion.

## OCCURRENCE OF LEUKEMIA.

In 1909 Tyzzer and I reported a series of tumors in the common fowl among which was a case of leukemia and five cases of lymphoma without invasion of the blood stream. This bore marked resemblance to so-called chloroma of the human. The pseudo or aleukemic variety in fowl has been described also by Nihonmatsu. As early as 1858 Leisering described leukemia in animals, stating that it is more frequent in dogs than in other house animals. Up to 1889 only five cases of leukemia in swine had been described. Auberlin and Morel have shown that lymphatic leukemia is well known in the dog and in the pig but is considered rare in cattle, although lymphadenic the aleukemic form, is reported by veterinarians in the ox and cow. Many of the cases have not been sufficiently studied to draw

\* Read at the Annual Meeting of the Medical Society of the State of New York at New York City May 23 1923

accurate conclusions regarding their true nature. These authors believe that lymphatic leukemia in cattle is an established fact and suggest that it would be interesting to study the connection and transition between lymphadenic and lymphatic leukemia.

Wells states that in studying mice in the course of tumor work a lymphatic condition indistinguishable from leukemia and pseudoleukemia in man has been repeatedly observed. Slye has found that true leukemia and pseudoleukemia in mice occur only in strains that have tumors and in heredity studies these diseases behave exactly as the true tumors. They have not, however, been successfully inoculated into normal mice in spite of many attempts. These observations lend support to the view of those pathologists who maintain that leukemia and pseudoleukemia are tumors of the myeloblastic and lymphoblastic tissues.

#### AGE AND SEX INCIDENCE

The number of cases of leukemia occurring in children is not so small as was previously thought. In the very young the condition is very liable to be overlooked. In acute febrile forms it is easily mistaken for typhoid fever or paratyphoid fever, or the ulcerative stomatitis and hemorrhages may cause it to be mistaken for malignant diphtheria, scurvy, purpura, or some severe infection. Adler, 1914, has searched the literature since 1845 and found only seventeen reported cases of leukemia in infants. He also emphasizes the frequency with which the diagnosis in infants is mistaken for other conditions.

We have observed a case of chronic myelogenous leukemia in a woman seventy-five years old.

#### HEREDITY

Various authors have suggested a possible hereditary factor in leukemia in man, but there is very little evidence in its favor.

In mice Slye has found that true leukemia and pseudoleukemia occur only in strains that have tumors and in heredity studies these diseases behave exactly as the true tumors.

#### PREGNANCY

We have personally seen two cases associated with pregnancy, one of which was in the latter months of pregnancy and the presence of the greatly enlarged spleen was less evident because of the gravid uterus. In the other the leukemia was noted a few months after parturition. Although the actual relationship of pregnancy and parturition to the development of leukemia is not proved, it is possible that in certain individuals the extra demand upon their blood-forming organs might result in the very abnormal response characterized by the condition of leukemia.

#### TRANSMISSION

In confirmation of the work of previous investigators, notably Ellerman and Bang, leukemia of the fowl was successfully transmitted in the same species from a spontaneous case into the fifth generation by Schmeisser by intravenous and intraperitoneal injection of organ emulsion.

The occurrence of a typical case of leukemia in the course of the experimental transmission of an acute disease of the fowl known as fowl typhoid suggests a close relationship between these two conditions. In the animals that do not die acutely after the first injection of the fowl typhoid bacillus there is an intermediate stage characterized by changes in the blood picture, and along with this myeloid infiltration of the organs may also occur.

This suggests the possibility of producing typical chicken leukemia by properly regulated doses of the bacillus of fowl typhoid. This work is of considerable interest from the point of view that the condition, leukemia, is not a distinct entity but an unusual blood reaction to various agents. In the fowl, however, in comparison with mammals the inflammatory response to stimuli is unusually marked. This tissue and blood response characteristic of the fowl, as shown by the work of Winternitz, Schmeisser, and by Rous (in the so-called chicken sarcoma) makes it impossible to apply directly the results of studies in fowl to similar conditions in man.

#### VARIETIES AND TYPES OF LEUKEMIA

In addition to the usual classification of leukemia into chronic myelogenous, chronic lymphatic and acute leukemia, the latter variety being further subdivided into the myelogenous and lymphatic types by certain observers, it has been suggested by Ward that the leukemias be considered and classified in a manner similar to that which is the usual custom in anemia, that is, that conditions where no contributing causal factor is discernible, be considered as *primary*, and all other leukemias as of *secondary* type.

*Primary leukemia* would indicate the response of the blood-forming organs to a stimulus of unknown nature. This stimulus is thought to be aroused by excessive destruction of white blood cells, and in response to this there is a great and irregular exaggeration of white cell formation. The liver, and even parts of the body which are not associated with blood formation in foetal life take part in this process of white cell formation, and this fact is one of the surest criteria of the presence of leukemia. Such a hyperplasia suggests a response to the demands of this hypothetical stimulus. Hence it is assumed that we must have primitive cells, hematoblasts or hemoblasts, capable of forming blood cells under the influence of a special and particularly powerful stimulus. The mechanism by which newly formed

white cells of the lymphocytic and bone marrow series gain access to the blood stream is little known, but from clinical evidence it seems to be a very variable factor even in individual cases. This variation may account for the aleukemic phases in leukemia.

It is apparent that *infection*, particularly in children, may under certain circumstances give rise to unusually high relative and also absolute increase in the white blood cells, as well as to abnormal forms of white cells in the blood.

Fractures are also supposed in some instances to produce so-called secondary leukemias. These are at times accompanied by peculiar blood changes. Simon reports a case of an adult negro with fracture of the ankle and crushed leg.

Cases of cancer reported by Kurpius and Kast showed greatly increased numbers, or the presence of many abnormal cells, chiefly myelocytes, in the blood and tissues. Various other conditions have been associated with leukemic like changes in the blood, such as variola hereditaria, syphilis, and also other types of syphilis, rickets, intestinal infections and tuberculosis. Experimentally Dominici produced myeloid changes in the blood in experimental tuberculosis, typhoid sepsis and potash poisoning although such changes are not comparable with those of true leukemia.

#### THE ACUTE LEUKEMIAS

The separation of the acute leukemias from the two well established chronic forms is not always easy and in some instances the dividing line is very indistinct, as subacute cases occur which bridge the gap between the typically chronic and acute cases. In general, however, the acute types of the disease present a stormy onset and the course is rapid usually terminating fatally in a few weeks or months. It may be doubted if any truly acute cases last over six months. Instances of longer duration raise the question whether in these a chronic leukemia, existing for some time without symptoms, may not suddenly have developed an acute exacerbation, a not infrequent occurrence.

When it comes to the separation of the acute leukemias into two subsidiary groups of acute myelogenous and acute lymphatic leukemia, even greater difficulty is encountered. The clinical picture and the course of the disease is practically identical in both, but in many instances a differentiation is possible by means of careful cytological studies and the newer methods of staining of the blood and tissues. There remains, however, a small group where the type of cell is so embryonic in character that it is almost impossible to decide whether the cell belongs to the myeloid or lymphocytic series.

The first case of leukemia running an acute course was described by von Tiedreich in 1857. The patient died two months after the onset of

the disease. Ebstein in 1889 described the clinical picture, and A. Fraenkel in 1895 called special attention to the pathological changes of the blood, stating that acute leukemias were all lymphemias in which the increase in the white cells was almost, if not entirely in the lymphocytes. From that date contributions to the literature of acute leukemia have been many, although the cases have been almost exclusively classified as acute lymphatic and indeed the existence of an acute myeloid leukemia was denied by the majority of writers until 1904.

In recent years it has become more generally recognized that an acute leukemia of the myeloid type is of more frequent occurrence than was formerly supposed. Undoubtedly many of the cases reported as acute lymphatic leukemia before the last decade would now be called myelogenous in the light of our present knowledge. It seems more reasonable to suppose that the acute myelogenous cases have been wrongly classified as acute lymphatic leukemia than to believe that the incidence of myeloid cases of the acute type has suddenly become greater. Indeed, a review of the more recent literature seems to indicate that acute lymphatic leukemia is actually the rarer disease.

#### ACUTE MYELOGENOUS LEUKEMIA.

The application of the oxydase test to the tissues as well as to the blood may give important confirmatory evidence in diagnosis. The myeloid cells reacting positively appear in sharp contrast to the lymphatic elements present. Here again a positive test only is conclusive as very young myeloblasts may not react. The demonstration of a proteolytic ferment will also add further proof of the myeloid nature of the tissue in any specific case.

#### ACUTE LYMPHATIC LEUKEMIA

Histologically one sees in these cases a gradual line of transition from the picture of chronic lymphatic leukemia with a tendency toward the preponderance of large lymphocytes as the infiltrating cells. Many cases of typical acute lymphatic leukemia however, may show few or no large lymphocytes in the tissues, the cells all being of the small type as they may be in the blood during life.

#### METABOLISM IN LEUKEMIA

The metabolism of leukemic blood is more active than that of normal blood. The nitrogenous balance is usually negative in acute, and is variable in chronic leukemia. The endogenous uric acid elimination and the uric acid content of the blood are usually increased. There is often retention of phosphates. This is seen clinically by intolerance of heat as seen in certain cases of marked hyperthyroidism.

### EFFECT OF RADIUM ON METABOLISM IN LEUKEMIA

The urine analyses in a case of myelogenous leukemia treated by radium have been made and charted. On observing this chart it is seen that after the first series of radium treatments the total nitrogen, urea nitrogen and ammonia nitrogen began to increase immediately, at the end of seven days the excretion reached a maximum and was more than double.

It seems evident that the changes in the nitrogenous metabolism depend upon the amount and nature of tissue autolyzed. Both the tissue autolysis and the products of nitrogenous metabolism are marked in the two cases of leukemia, Cases I and II. In these two cases also the phosphates show an extraordinary increase due to the nature of the tissue autolyzed. In a case of sarcoma similarly treated by radium, the bulk of tissue autolyzed was obviously less than in the cases of leukemia, but following radiation there was definite softening and fluctuation of the growth. The nitrogenous products in this case while definitely increased were much less so than in the cases of leukemia above referred to. In a case of carcinoma of the breast the lesion consisted of hard, brawny, fibrous tissue in which one would expect little or no autolysis. In this case there was practically no increase in the products of nitrogenous metabolism, and only a moderate increase in the total acidity of the urine.

It would appear that the changes in the urine as a result of the radiation over the spleen are due in part at least to the products derived from the autolysis of the abnormal tissue under the influence of the radiation from radium. These results throw no light upon the nature of the constitutional symptoms which occasionally result from the radiation of radium and of the X-rays.

### PHAGOCYTIC POWER OF THE WHITE BLOOD CELLS IN LEUKEMIC BLOOD

The work of Tschistovitch and Arinkine confirms our own observations that (1) the phagocytic power in leukemia is usually enfeebled, (2) the phagocytic power is especially marked in the polymorphonuclear neutrophils which are also the phagocytes par excellence of normal blood, (3) the unripe forms of leukocytes, which one finds in great quantity in the blood of leukemias, possess a feeble phagocytic power or they may lack it entirely.

### COMPLEMENT CONTENT OF SERUM AND PLASMA OF LEUKEMIC BLOOD

The view has been advanced that complement is formed by the white blood cells. Gurd believes that complement occurs in the circulating plasma as complementogen and is rendered active as a result of the liberation of some substance, prob-

ably similar to thrombokinase, which is produced chiefly by the white blood cells. As the white cells in leukemia are in great part abnormal morphologically, it may be argued that their function is likewise perverted.

The blood in leukemia shows such striking numerical and morphological changes that it seems possible that alterations in the function of the cells or plasma might be detected by examining certain biological properties of the serum. A study was made by Ordway and Kellert on the hemolytic property of the blood serum and citrated plasma, with particular reference to its complement content. It was thought that if the complement is produced by the activity of or the disintegration of white blood cells it might be correspondingly increased in cases of leukemia.

It was found, however, that the hemolytic complement of the serum in lymphatic and myelogenous leukemia is not increased.

### PRODUCTION OF ANTISERUM, LEUKOLYTIC FOR LEUKEMIC WHITE BLOOD CELLS

We have been able to produce an active leukolytic serum by repeatedly injecting into a rabbit white blood cells from cases of myelogenous leukemia. The degree of its specificity is as yet undetermined.

### PRODUCTION OF BACTERIAL ANTIBODIES IN LEUKEMIC BLOOD

Investigations of the serum in cases of leukemia in reference to the production of antibodies have been made by several observers. Moreschi in twelve cases of leukemia, by means of the injection of typhoid vaccine, was able to detect very little or no formation of agglutinins, nor was there local or general reaction to the vaccine. Hoke showed that leukemic blood contains products which destroy bacteria, and Stenstrom found that when leukocytes and bacteria were injected into rabbits there was less antibody production.

### PRESENCE OF A LEUKOTOXIC FACTOR IN LEUKEMIC BLOOD

Packard and Ottenberg believe that there is a leukotoxic factor in lymphatic leukemia. They draw a close analogy between the aleukemic or sublymphemic stage of leukemia and aplastic anemia, in both of which there is a great diminution of the granular leukocytes in the circulation. They consider the toxic factor similar in certain respects to the action of benzol which was used by Selling experimentally to produce a similar destruction of granular leukocytes.

These authors think that there is in leukemia both an overproduction and also an accelerated destruction in leukocytes, and that the number of white cells in the circulation at any one time depends upon which of these two processes predominate.

## PRESENCE OF FERMENTS IN LEUKEMIC BLOOD— PROTOPLASMIC OXIDIZING

It has long been recognized that the leukocytes from the blood of cases of myelogenous leukemia contained a ferment which is capable of digesting fibrin. Both the polymorphonuclear leukocytes and myelocytes contain enzymes that are capable of digesting blood serum. This enzymotic action has been found in the cells from the blood of cases of myelogenous leukemia by Joelmann and Müller and by others, but these investigators have failed to demonstrate that lymphocytes either from cases of lymphatic leukemia or lymph nodes from cases of pseudoleukemia, possess any such action.

In view of the discussion as to the origin of the large lymphocytes in so-called acute lymphatic leukemia and their relation to the granular myelocytes on the one hand and the non-granular lymphocytes on the other, the conclusions of Longcope and Donhauser are of interest. These authors found that the leukocytes of the blood of normal individuals and of patients showing a marked polymorphonuclear leukocytosis contain enzymes capable of digesting coagulated blood serum in neutral, alkaline, or acid solutions.

This result seems to show that the large cells of the so-called acute lymphatic leukemia are not true lymphocytes, but are related to the granular myelocytes, and should probably be considered as the forerunners to these cells. This view is further strengthened by the way these cells react in studies on phagocytosis and to staining methods for the demonstration of the so-called peroxidase or oxidizing ferment.

The oxidizing ferments of polymorphonuclear leukocytes and myelocytes were first recognized through observations that pus and leukemic blood contain some substances capable of producing a color change in tincture of guaiac. The method developed by Winkler for demonstrating the so-called oxydase or peroxidase substances consists of aqueous solutions of alphanaphthol and of dimethyl para phenylene diamine. The oxidation of such a mixture results in the formation of indophenol.

Brandenburg advocated the use of the Winkler reaction on blood smears as a means of differentiation of leukemia, and emphasized its value particularly in the differentiation of immature myelocytes, sometimes encountered as the predominating form in acute myelogenous leukemia, from the large cells of acute lymphatic leukemia. The method of Winkler, however, has not proved entirely satisfactory. The solutions rapidly deteriorate even when carefully protected from air and moisture. The compound is very unstable in the aqueous solution used for the reaction and the stained preparations are not permanent, but usually fade out in the course of a few hours or days. Evans gives the life of the stain as ten

minutes. Graham has modified the Winkler method of treatment of blood smears and tissues with an alphanaphthol solution containing small amounts of hydrogen peroxid. Blood smears treated with the alphanaphthol solution followed by pyronin and methylene blue present a picture suggesting the Romanowsky stains. The granules of polymorphonuclear leukocytes and myelocytes are however much more definitely indicated. In frozen sections stained with a mixture of alphanaphthol solution and pyronin and counterstained with hematoxylin the granule bearing cells are sharply differentiated and the sections can be cleared and mounted in balsam. More recently Graham has described a method in which benzidine is employed as a peroxidase reagent for blood smears and tissues. This stain is permanent easily prepared, and it may be counterstained by any of the so-called polychrome stains, such as Wright's stain, or a modification described by McEwen. As a result of these improvements in technique, the evidence seems to indicate that there is an enzyme of the so-called peroxidase group. The presence of this body in the leukocytes of the myelocytic series and its absence in the lymphocytic series is another biological argument for the fundamental dissimilarity of these two cell groups.

## THEORIES OF CAUSATION AND RELATIONSHIP TO OTHER PATHOLOGICAL CONDITIONS.

The leukemic and aleukemic character of various lymphomata is seen not only in the human being but in fowl. Tyzzer and Ordway reported a series of tumors in the common fowl among which was a case of lymphoma associated with lymphatic leukemia and five cases of lymphoma without invasion of the blood stream. The main distinction between aleukemic lymphoma and lymphoma with leukemia is that in the former the tumor is extravascular, while in the latter it is largely intravascular. In certain cases the tumor is both extravascular and intravascular in its growth. The cells of these lymphomata in the fowl most frequently resemble those of the germinal centers of lymph follicles. Such tumors, when inoculated, readily grow in the same individual but with considerable difficulty when inoculated into other hens. They apparently demand peculiar conditions which are more suitable in the individual in which they arise. Such tumors present the properties of malignancy, that is, unlimited growth, infiltration of normal tissue and metastasis. The leukemic or aleukemic tumors in fowl may occur as a definite primary growth either with or without secondary nodules, or the condition may be so disseminated that the site of origin cannot be determined. The peculiar cellular reaction of fowls, however, makes it difficult to apply directly the results obtained to the subject of tumors in mammals. Whether the char-

acteristic growth of cells in aleukemic and leukemic leukemia, in both lower animals and man, is the result of cell stimulus from within, as in most forms of true tumor growth, or is due to the introduction of a stimulus from without, a filterable substance, ultra-microscopic virus, or a physical or chemical irritant, is at present in doubt. It is possible that several etiological factors are involved and that these upset the normal balance of blood cell production and blood cell destruction and hence lead to leukemic, subleukemic and aleukemic phases or types of the disease. The significance of the presence of the so-called Auer's bodies in certain of the cells, chiefly the myeloblasts, in blood smears and in sections of tissue in some cases of leukemia is unknown.

#### RADIUM TREATMENT

Peabody reports symptomatic improvement in all cases of myelogenous leukemia treated by radium under his observation. Of thirty cases of myelogenous leukemia treated by radium Giffin reports a marked improvement in twenty-six and in thirteen of these the improvement was remarkable. Hemorrhage was checked after one or two series of radium treatments.

Striking changes are found in the urine of patients with myelogenous leukemia treated by radium. There is a marked increase in the total nitrogen, urea nitrogen and ammonia nitrogen. The uric acid is slightly increased. The total phosphates are increased remarkably. There is apparently no accumulation of uric acid in the blood, at least when the kidneys are in normal condition. Because of this marked increase in the metabolism it seems advisable to have the patient on a purin-free diet during and following the series of radium treatments. The changes in the metabolism of patients treated by radium resemble in certain respects those resulting from treatment by X-ray.

#### CONCLUSIONS CONCERNING VALUE OF RADIUM TREATMENT

1. Surface applications of radium in leukemia produce striking, indeed remarkable, improvement in (a) the blood picture which becomes almost normal, (b) in the size of the spleen and glands which are reduced almost to normal, (c) in the general condition of the patient who from an emaciated and weak condition may become plump and strong.
2. The duration of remission is variable, it may last from months to years.
3. The results of radium treatment are not regarded as curative. It is believed to be, however, the safest, as well as the promptest palliative measures in cases of chronic leukemia whether refractory or not to benzol or X-ray treatment. From the results of radium therapy in leukemia it is believed to be the best form of treatment now at our disposal.

#### SPLENECTOMY FOLLOWING RADIUM TREATMENT FOR MYELOGENOUS LEUKEMIA

Although the results of splenectomy in leukemia have been almost universally fatal when undertaken while the spleen was enormously enlarged and the general condition of the patient was very poor, we suggested that when the spleen had been reduced to normal size and the general condition of the patient had greatly improved, following radium treatment, splenectomy at this time might prevent a relapse.

Giffin reported that ten of the patients who were operated upon were living and in good condition nine months to a year and seven months after the operation. Yet the disease may recur. Of seven patients operated upon within six months of the onset of the disease, six patients were alive at the time of this report. It is believed that in certain chronic types of myelogenous leukemia with fibrous spleen and a relatively low white count, splenectomy may be justified for the comfort of the patient, but there is no evidence that the disease is altered in any definite way by splenectomy, for recurrences are not prevented. The results of radium treatment were so good temporarily that it led to the inference that possibly malfunction of the spleen might be an important factor in the production and continuance of leukemia, for these results, remarkable temporarily, have been secured by direct radiation over the enlarged spleen. The results of splenectomy as reported by Giffin, however, do not justify this supposition.

#### UNUSUAL FORMS OF LEUKEMIA AND RELATED CONDITIONS—ATYPICAL LEUKEMIA

The term leukanemia should be discarded. It was proposed by von Leube, who described a case of severe anemia which showed features of both pernicious anemia and leukemia. The red cells and hemoglobin were markedly reduced, the color index was high, while macrocytes and megaloblasts were present. The white count was approximately ten thousand with 13.6 per cent myelocytes. The autopsy findings proved that this case was neither pernicious anemia nor leukemia, while the abscesses found in the liver and spleen with areas of necrosis in the marrow, indicate that von Leube was probably dealing with a severe anemia of infectious origin in which a stimulation myelopoiesis occurred. The fallacy of classifying leukemia on a purely hematological basis is here evident and the necessity for conclusive histological proof is undisputed. If the cases in the literature reported as leukanemia are carefully scrutinized they will be found to be instances of severe infectious anemia, pernicious anemia, tumor of the bone marrow, aleukemic leukemia, or acute leukemia.

Another term which should be discarded is that of mixed leukemia. Since it has become

generally known that there must be careful study of the large mononuclear cells which show no granules in leukemic blood, to determine whether they are myeloblasts or lymphocytes, there have been much fewer cases reported as of the mixed type. Transition from lymphatic to myelogenous leukemia or vice versa does not occur, but is described because of the same confusion existing with regard to myeloblast and lymphocyte. An acute myeloblastic leukemia with its large non granular cells and intermediate forms (premyelocytes) may suggest a mixture of lymphatic and myelogenous leukemia. A chronic myelogenous leukemia may show an acute exacerbation with large numbers of myeloblasts. Here one might think that the type was a mixed one or that a transition from chronic myelogenous to chronic lymphatic leukemia was taking place.

### CHLOROMA

Another instance in which confusion of classification has been manifest is seen in the case of the so-called chloroma. This condition was formerly classed with the tumors, but as a result of increasing knowledge, it is now believed to be a somewhat atypical form of leukemia. Indeed it is now generally conceded that chloroma is closely related to, if not a form of leukemia. It shows a remarkable similarity to the acute types of leukemia and in many instances the clinical symptoms, the blood picture and the pathological findings are identical with those of acute leukemia. The green color of the nodules, the tendency to periosteal proliferation and the peculiar localization about the orbit points which were originally considered as of infallible differential diagnostic value, have been found to be inconstant and therefore unreliable. In a recent case of chronic myelogenous leukemia, Sulzman has reported an orbital deposit of myeloid hyperplasia.

We may distinguish two types of chloroma according to the type of hyperplastic cell, (a) a myelogenous or myeloid chloroma (myelogenous chloroleukemia of Nageli, chloromyelosarkomatosis of Sternberg) and (b) a lymphatic or lymphoid chloroma (chlorolymphosarkomatosis of Paltauf, chloroleukosarkomatosis of Sternberg and chlorolymphadenosis of Lehdorff). Boechat, reviewing the literature, says that twenty-one out of twenty-six cases are described as showing large lymphocytes. Since 1907 all cases reported except one have been described as showing large lymphocytes or myeloblasts. The oxydase reaction has subjected the large mononuclear cells to a more critical study, and just as there has recently been an apparent increase in the number of cases of acute myelogenous leukemia over acute lymphatic so too, there is an ever increasing number of cases of myelogenous chloroma and a diminishing group of cases reported as lymphatic chloroma.

It is difficult, indeed in certain instances, impossible to draw a sharp line between myelogenous chloroma and acute myelogenous leukemia. The presence of a green color in the nodules or the tendency to growth under the periosteum and especially about the orbit, seems to be too arbitrary a standard, for cases occur in which the green pigment is absent, and still others in which the peculiar proliferative growth and localization are missing but yet green tumors are found. Again, cases of acute myelogenous leukemia may show the same tendency to localization and growth as does the typical case of chloroma.

The clinical symptoms do not serve surely to differentiate myelogenous from lymphatic chloroma nor from the acute leukemias. Thus there may occur the same acute onset and rapidly progressive course with severe anemia, fever, stomatitis ulcerative and gangrenous processes of the mouth and throat, hemorrhagic diathesis, perosteal growths and enlargement of the spleen and lymph glands of varying degree.

The blood picture is usually that of an acute myelogenous leukemia. The red blood count and the percentage of hemoglobin usually fall rapidly. The number of white blood cells is generally low at first, increasing to fifty thousand or much above, even to nearly a million. The stained smear shows large mononuclear cells some without granules and others with a very few, typical myeloblasts and premyelocytes. Eosinophilic and basophilic cells are unusual. Nucleated red cells may be few or numerous. The red cells also show the characteristic changes in size, shape and staining reaction of a severe anemia. Some cases may have a relatively low white count throughout their course. Evidence of typical cell formation such as marked irregularities in the shape of the nuclei of the myeloblasts may occur, identical with the changes in acute myelogenous leukemia.

The presence of oxydase or a peptic ferment in the abnormal cells is often demonstrable. A positive reaction may be of great diagnostic value as in a case which is now under our personal observation, where the blood was followed from day to day with the oxydase reaction (Graham's modification) and though negative at first, later there were found increasing numbers of cells with positively staining granules suggesting that the case was a chloroma of the myelogenous type.

Jacobæus describes the blood from a case of chloroma, and states that the supernatant layer of leukocytes in a centrifuged specimen of plasma showed a greenish tint. We have previously noted this coloration of the leukocytes in citrated blood from several cases of chronic myelogenous leukemia, particularly in cases in which the more primitive cells predominated. This also argues for the close relationship existing between chloroma and leukemia.

The green color of the nodules is striking but may be absent in some cases. In some instances green areas of infiltration are found without pre-dilection for massive growth in the subperiosteal layer of the bones. Splenic and lymph gland enlargements vary in degree. The green coloration may be slight or marked. In the bone marrow there may be diffuse or localized greenish areas of hyperplasia.

Histologically there is found evidence of a circumscribed or diffuse infiltration of the blood-forming organs and in a varying degree of other organs. The myeloid system of cells is involved and the predominant cell type is generally the myeloblast, although myelocytes in varying numbers may occur. The proliferation is frequently of such high grade, however, as to resemble true tumor growths.

## TREATMENT OF ANÆMIA BY TRANSFUSION \*

BY W W G MACLACHLAN

PITTSBURGH, PA

THE transfusion of blood as a therapeutic measure in pernicious anæmia has received a fair trial over a period of a little more than a decade. Similar to many other experiences in medical therapy, the advent of transfusion was heralded as a great advance in the treatment of this really pernicious disease. Much was expected, in fact, the possibility of cure was even suggested, but we were not long left in doubt as to its value, for it is not a panacea for Addison's anæmia. The widespread use of blood in the treatment of pernicious anæmia should give us at least a fair idea at the present of its actual therapeutic status. A considerable literature has been developed pertaining to transfusion as a medical measure, and with much of this writing you are no doubt familiar. There is certainly a uniformity of opinion as to the usefulness of this procedure in pernicious anæmia. We can add nothing further to what has been written already, but merely state our clinical impressions, which, in general, are in agreement with those of other observers of this relatively common disease.

A great deal has been done to simplify the technique of transfusion so that there is little need today to regard the actual giving of blood as a more complicated procedure than the introduction intravenously of bicarbonate or salt solution. This is undoubtedly due to the development of the citrated method. There is certainly something to be said for a method which is readily portable and can be carried to the sick room, with minimum discomfort to the recipient and to the donor. Whole blood naturally must be better than citrated blood. But how much better? Are the results in pernicious anæmia treated by one method so different from those treated by the other, that we can answer this question? Personally, we do not think that they are. We have had the opportunity of following both methods and cannot see any difference in the results. In my opinion there is no question that the citrated

method is much simpler to carry out and less taxing to the patient and to the donor. The donor is entitled to some consideration and, therefore, a puncture wound by a needle is preferable to dissecting the vein. There are a number of citrate methods of transfusing and while we believe that the proper method to use is the one to which you are accustomed, it is a wise procedure to adopt the simplest one possible. For whole blood, the Unger method appears to me to be the most satisfactory.

More important, however, than the question of simplicity, is the factor of danger. Here again one must say that whole blood naturally should be better taken than that to which citrate has been added. One may again question on practical grounds whether this is true, particularly in dealing with amounts of blood not exceeding three or four hundred cubic centimeters. With larger amounts of blood there may be more reactions but with the smaller amounts it has been my experience to observe no more reactions than when the whole blood was used. We have been very much impressed by the fact that reactions follow more frequently when using the citrated method, if the transfusion is given rapidly, an error very liable to be made.

In the early days of transfusion the donors were chosen chiefly by matching their blood with that of the recipient. This method is, to be sure, the most accurate and without doubt the best, but it is time-consuming. With the introduction of blood grouping, by the methods of Jansky and of Moss, on account of their great convenience and at the same time their trustworthiness, this method of the selection of donors in general has appeared to replace the older method of individual matching. Some observers, however, who have had a large experience in blood transfusion, remained true to the individual blood matching, and one is inclined to feel that this method is again becoming more popular. Guthrie and Huck, in their recent study on blood grouping, in which they have demonstrated clearly

\* Read at the Annual Meeting of the Medical Society of the State of New York at New York City May 23, 1923.

more than the four known groups, certainly supply an argument in favor of the individual matching of blood. One hesitates, however, to give up such convenient methods as the Jansky or the Moss, particularly if, in addition, one has experienced little or no serious results by using donors classified in this manner. If all reactions following transfusion are to be attributed to agglutination then this last work referred to is an argument for the return to the individual matching of blood. The answer to this question can be left to the future.

There are, in general, two types of reaction to be observed. The more common one consisting of a chill lasting from ten minutes to a half hour followed by a rise in temperature often to 104 or 105 degrees, is familiar to anyone seeing a number of transfusions. This temperature drops rapidly and, as a rule, the patient is normal or nearly so on the following day. Varying degrees of this reaction may occur. The chill may be absent or the patient merely feel somewhat uncomfortable and the temperature be not so evident. At other times, one observes a rise of one or two degrees in temperature, the patient being entirely unaware of this condition. Guthrie has called attention to a point in reference to these reactions which is often overlooked. He suggests that if frequent and regular temperature readings be recorded after transfusion, many will show a rise in temperature with no other signs, these cases ordinarily being considered as having no reaction. A more alarming and certainly more serious but fortunately a rare reaction, is the one which occurs after the giving of a few cubic centimeters of blood. This usually develops with acute pain in the lumbar region, followed by a feeling of constriction in the thorax, flushing of the face, rapid and difficult breathing and a weak, rapid pulse. The conjunctivae are as a rule suffused. We have never seen edema of the face develop although this has been described. This reaction was observed on six occasions and in three instances a hemoglobinuria developed. To say the least this state is extremely alarming, however, none of our cases died and all were subsequently transfused with, of course, another donor. I have observed both of these reactions in citrated and in whole blood, and therefore believe that we must seek their explanation in other factors than the added citrate solution. It is more like an anaphylactic phenomenon. None of these cases developed urticaria. It is unwise to continue the transfusion in the presence of this latter reaction. The severe second type may be fatal but even when this disastrous result does not occur it is usually harmful, although in a case of secondary anemia this violent reaction following the injection of 10 cubic centimeters of blood produced a subsequent rise in the blood equal to what one would expect from a successful trans-

fusion. The first or milder type may not appear to have any subsequent ill effect, although my impression is that the severer the reaction, the less benefit appears to result from the transfusion. However, in some instances this does not seem to hold true.

Is it possible that there is some other factor than agglutination concerned in the reactions following the introduction of blood into the circulation of the recipient? It would appear to be difficult to explain the severe reactions that very occasionally are noted after giving very small amounts of blood on the basis of the agglutination of the donor's cells. We have noted this in cases that have been properly typed by the Moss method and in others that were individually matched. It may occur when using the citrated blood or the whole blood and be present at the first transfusion or after several transfusions have been made. A year ago, while transfusing a patient who was in group IV from a donor of the same group who had been used three times prior to this in other cases, satisfactorily, after giving about 20 cubic centimeters of blood, the very severe reaction referred to previously developed. The transfusion was stopped at once and as the blood was quite fresh it was decided to give it to another patient with pernicious anemia who was also of the same group. With about the same amount of blood a similar reaction occurred. The patients and donor were retyped and the same grouping was confirmed. Unfortunately, the bloods were not individually matched thus depriving this observation of a great deal of its value. We cannot help but feel that this type of reaction is not to be eliminated by blood grouping or by individual matching of blood. Guthrie has recently suggested that the explanation lies in the plasma rather than in the cellular elements. It is well known that in some instances of emergency where it is impossible to get a proper donor and where the life of the patient is at stake, the transfusion of blood from another group, or where the blood matching was not satisfactory, has been followed by no ill effects. We have seen this demonstrated in cases of shock and of hemorrhage following severe injuries received by coal miners. It is also not unlikely that mistakes are made in the blood grouping due to the deterioration of the stock serum. Guthrie has pointed this out and we agree with his observation. We are aware of several instances where this occurred with apparently no reaction or ill effect. It seems not unlikely that the amount of blood transfused in these instances is a factor. We do not, in any way, wish to indicate that agglutination is not the most important factor in reactions associated with transfusions, but there may be others which further research will bring to light. Already, a great deal of work has been done in attempting to solve this problem.

but it would take us too far afield to venture into a more detailed discussion of this question

Since transfusion has become a recognized procedure in the treatment of pernicious anæmia, we have been inclined to forget certain characteristics of the disease, particularly the spontaneous return to the normal or near normal after periods of ill health. A pernicious anæmia has usually a certain number of remissions. If we could only prove that transfusion added one or more remissions to the course of pernicious anæmia, we would solve the question of the value of this procedure. It is known that cases have been practically unconscious and yet have returned to comparatively good health without the aid of blood. An excellent example to indicate this point could be taken from the case reported by Stone, of a farmer who was admitted to his service in December, 1905, having been ill since March of the same year. He was in a semi-comatose condition on admission. On January 4, 1906, his red count was 296,000 with a hemoglobin below 10 per cent. Three days afterwards the red cells were 582,400, hemoglobin 10 per cent. The blood count gradually rose and on January 19th the red cells were 1,286,300, hemoglobin 20 per cent. The patient was well enough to leave the hospital in five weeks and he resumed the active work of a farmer in the month of May of that year. In November, 1906, he had 2,768,000 red cells and 81 per cent hemoglobin. One year later, October 19, 1907, red cells were 3,792,000, hemoglobin 92 per cent and in December of the same year, or two and one half years after the onset of his illness, the red cells had risen to 4,438,000 and the hemoglobin was 94 per cent. This case was not transfused. I recently wrote to Dr. Stone regarding the later history of this patient and he told me that the man lived until 1911 apparently perfectly well when, as is usually the case, his symptoms returned suddenly and he died in a couple of months. One would have been almost justified in attributing to transfusion in a case of this type life saving qualities, if it had been used. Further, it should be remembered that this disease, like others, varies considerably in its severity and although the majority of cases die within the three year time, some have been known to live for as long as nineteen years, while the shortest duration has been a question of but a matter of weeks. With a disease, therefore, having these natural variations of such a wide latitude, it behooves us to be very careful in expressing dogmatic statements with reference to therapeutic procedures.

One should also take into account the stage of the disease in that individual. Is the disease early, or has the process about run its course? Naturally the results from transfusing will appear more beneficial and more striking in the early stages of the process than in the terminal stages. Hence,

it is very difficult to compare cases of pernicious anæmia with reference to their reactions to blood transfusions unless this is kept in mind. Further, in a given case of pernicious anæmia showing a steady decline in the blood the response to transfusion is different than in the same patient who has gone through the decline and is now on the up grade. At this later point, stimulation may be obtained with very much less blood than at any point on the down grade.

The quantity of blood transfused was, in the early days, usually a large amount—from 800 to 1500 cubic centimeters. Subsequent work seems to indicate that smaller amounts of blood given more frequently is the more popular method. These small amounts have been so diminished that some workers have reported the giving of only 20 cubic centimeters of blood on different occasions with apparently good results (Colwell). We prefer to give from 200 to 250 cubic centimeters and repeat the amount when the rise in blood seems to have stopped. In some of the chronic types where there is no response after two or three transfusions and when the reticulated cells are below normal it is useless to continue this form of therapy.

There are several methods of indicating improvement in cases of pernicious anæmia. The general appearance of the individual with the disappearance of symptoms is probably the best guide that we have. As a rule, the blood count corresponds with this change. Probably an increase in red cells occurs before the clinical signs of improvement are manifest and therefore, although there are exceptions to the rule, one of the best guides that we have as to an oncoming remission is an increase in the red cell count. It is well known, however, that the actual number of cells do not necessarily always give an indication of the actual condition of the disease. Some individuals with a count under two million appear to be infinitely better in every way and able to carry out fairly arduous duties, whereas some, especially those patients with nervous manifestation, may be virtually bedridden with a blood count over three million. For the whole of last year a patient of mine who has had pernicious anæmia for three and one half years, worked steadily as the foreman of a large railroad shop with at no time a blood count over two million cells. On the other hand, we have had recently from our medical service two cases of pernicious anæmia which came to autopsy showing clinically a red blood count of almost four million with hemoglobin percentages of 80 and 95, profound ataxia and loss of bladder control. Improvement, therefore, in the red count must be correlated with the general clinical picture before it can properly be interpreted.

As a practical measure, the finding of an increased number of nucleated red cells is of little

value, as the presence of nucleated reds during the varying stages of this disease is by no means as frequent as we are led to believe. It is our impression that not more than half of the cases of pernicious anaemia that one sees in a hospital clinic show nucleated reds in the blood. Possibly if they were seen earlier these cells would be noticed more often. Evans has recently called attention to the relative increase in the percentage of polymorphonuclear leucocytes as indicating the beginning of a remission. Minot and Lee have emphasized the value of a rise in platelets as an index of improvement.

The vital staining method to demonstrate reticulated red cells was brought out a few years ago but never has been made use of routinely to the extent that we believe the method deserves. Possibly this is due to the fact that it was difficult to get a good brilliant crystal blue. Certain toluidin blues and Nile blue sulphate work just as well. Considerable information as to the activity of the blood-forming structures is most accurately brought out by vital staining. The method of staining is very simple but the counting is tedious. We consider the normal individual to contain not more than a half per cent of reticulated cells. In pernicious anaemia this count is often increased to between two and five per cent or higher especially in the early stages of the disease, while toward the latter months the reticulated cells as a rule fall below the normal and may reach a figure as low as one-tenth of one per cent. Occasionally, we have observed instances where we could not demonstrate a reticulated cell. If after transfusion the reticulated cells are increased in number and this increase persists there is a strong likelihood that a remission is going to occur. But on the other hand if after two or three transfusions there is no increase in reticulated cells the likelihood is that a remission is not coming or as one occasionally sees a time period of several months elapses before a remission occurs. The blood level in remissions of this type as a rule is not high. One notices infrequently a particularly high reticulated cell count occurring under different conditions. Shortly before death these cells may reach as high as 30 per cent and then almost disappear from the blood stream. One may compare this to what has been observed and called the bone marrow crisis, the bone marrow in making a final effort throws off into the blood stream many nucleated red cells. We were interested in these cases to notice that nucleated red cells were not found at the time when the reticulated cell count was at this high level. One might refer to this as the reticulated cell crisis and in pre fatal cases it probably indicates an almost agonal effort of the bone marrow. Bowcock has described a similar condition but with an increase of nucleated red cells at the same time. We have however, recently observed this

same increase in an old case which was associated with subsequent extremely rapid improvement and the course in the past two months has indicated that the improvement has been lasting, at least for this short period of time. In this case, moreover, no nucleated red cells were seen. It is our belief that observations on the reticulated cells are of decided value.

My impression of the results that we may expect from transfusion is very similar to the one expressed by Bloomfield in reviewing the results noted in the Johns Hopkins Hospital. The easiest and quickest way of bringing on a remission is by transfusion. After the remission has developed there is no indication that it is of longer duration than one which comes on normally, so therefore in this sense, transfusion does not prolong life. It may well be asked, can a blood transfusion bring on a remission which would otherwise not appear? Everyone has seen an occasional case where the use of blood has been so intimately related to recovery that one would almost be forced to answer our question in the positive. Nevertheless we are by no means convinced that transfusion adds to the number of remissions of this disease. The case reported by Stone and referred to previously indicates how difficult it is to give a positive answer to this question. It is obvious that the giving of blood may hasten a remission and thus the patient is made more comfortable by his period of illness being shortened. If his remissions however, are not increased in length and the intervening period of ill health is shortened by transfusions, is it not reasonable therefore, to suppose that by this method of treatment we actually decrease the period of life? This may sound somewhat hypothetical but there is reason for holding this view. One must not be misled by the easy manner in which these cases can be returned to the near normal by transfusion. The immediate result is often so good and so startling that we are at times possibly liable to lose sight of the ultimate result. At best, it is a measure which brings temporary improvement while occasionally this improvement is so striking that it almost suggests that the patient's life was saved by the procedure. On the other hand, in cases with spinal cord lesions it is valueless from the nervous system point of view even in the presence of some blood improvement. On the whole we think it better to give small doses of 200 to 250 cubic centimeters repeated at short intervals observing the red cell and reticulated cell count. Failure of these cells to respond under these conditions is an indication to stop transfusing as the case is probably a chronic one and time must be allowed if the remission is to develop. But if numerical improvement is noted, further transfusion should be delayed until there is evidence that the increase in cells has ceased. Try to give as little blood as is possible to attain the result.

In closing, it would be well to refer briefly to the use of blood in secondary anæmia. This is really a far greater field and a more important one than the primary anæmias because there can be little question that under certain conditions life is saved by the adoption of this procedure. Therefore, in referring to this type but briefly, we do not mean to underestimate its importance. There are some secondary anæmias which it would be well to mention. In pregnancy an anæmia developing prior to delivery and not associated with any marked loss of blood at delivery the response to transfusion is very striking. The anæmia of lead poisoning also reacts very favorably. Possibly this will be unnecessary in the future in view of the recent work of Aub, who has given large amounts of dilute phosphoric acid with the subsequent rapid elimination of the lead retained in the bones. Hemorrhoids, bleeding over a long period of time, are associated with a secondary anæmia which often persists even after the removal of the hemorrhoids and is very refractory to the usual treatment. The response to transfusion in this condition is particularly good. To counteract the anæmia associated with bleeding from a chronic peptic ulcer and to make the operative procedure a safe one, the use of blood is almost demanded. The results obtained in pyæmic states have been variable. It has been our impression that the end results were better with repeated transfusions of small amounts, 250 cubic centimeters, at frequent intervals rather than a large amount on one or two occasions. The extensive use of transfusion in children for various conditions has been well brought out by the work from the Sick Children's Hospital at Toronto.

The response following transfusion in a secondary anæmia is, as a rule, entirely different from that in a primary anæmia. A few years ago we made certain observations on twelve consecutive cases of primary anæmia and it seemed to us that the response in a given time, 24 hours after transfusion, bore a certain general relation to the amount of blood injected. We believed that 100 cubic centimeters of blood at the end of 24 hours would produce from 100,000 to 200,000 red cell increase and the same ratio would be present if larger amounts were given. Huck has made some similar observations but was not willing to draw any conclusions. In a secondary anæmia, however, with the injection of 250 cubic centimeters of blood, one may note in 24 hours that at times the cell increase has been almost one million. In other words, the response in secondary anæmia is very much greater than it is in primary anæmia. The same is true for the hemaglobin percentage. In primary anæmia, it is unusual for 250 cubic centimeters of blood to produce in 24 hours a rise in the hemaglobin percentage of more than 5 per cent, while in a secondary anæmia the rise may be

10 to 15 per cent in the same period of time. Although we have not followed the secondary anæmias by the reticulated cell method as closely as the primary anæmias, it has been somewhat of a surprise to find very little increase in reticulated cells associated with a great numerical change in the reds.

NOTE Since this symposium, the author has been able to confirm the statement of Guthrie and Huck that errors in the grouping of blood are liable to occur due to the deterioration of the serum and that subsequent reactions may be explained on this basis. It would seem to us advisable that all severe reactions occurring during the transfusion should be investigated, particularly in reference to agglutination by the method of direct matching. We believe the direct matching of blood is the most satisfactory method for selecting donors.

## THE OBLIGATIONS OF THE MEDICAL PROFESSION \*

By EUGENE H POOL MD

NEW YORK CITY

A GROUP, like an individual, is prone to exaggerate its privileges and to minimize its obligations at the same time magnifying the obligations of unrelated groups. My aim is to remind you of some of the obligations of this body.

The County Medical Society represents organized medicine. Organized medicine is an essential. It affords, among other attributes a link between the profession and the public for their mutual advantage. But organized medicine must acknowledge deep obligations.

Constructive work, within our rank, should be our first aim, negative, critical, protective efforts, while essential, should be secondary. A few features will be cited to render this discussion somewhat concrete.

The subject of outstanding importance at the present time has to do with unlicensed or sectarian practitioners of medicine.

The cults are objectionable, not because they interfere with the doctor, but because they are a menace to the public. It is often said that every person who consults a quack has first gone to one or more doctors, that the patient seeks something new on account of some form of dissatisfaction. This dissatisfaction is based largely upon impatience with the ordinarily protracted processes of repair and the somewhat tardy evidence of the efficacy of therapeutic measures. At times it is because the medical man has erred in not treating the patient—only the disease, as a result, while the body may mend, the mind is restless and dissatisfied and other advice is sought. This suggests an obvious means of improving our services. The *Literary Digest* September 22 1923 discusses 'What People Think of the Doctors'. An analysis, we are told, shows that some 6,000 persons in Chicago think of the medical profession and why they patronize other agencies. Twenty-two reasons are given in detail, but careful analysis shows that these are "chock-full of unadulterated lies polite half truths and delirious fancies." Some one, the writer states should tell those 6,000 persons the truth about medicine.

The important feature is for the profession to train the public as to the absurdities of most of the claims of the cults and their ignorance of disease. In the interest of the public let us insist that anyone practicing medicine under whatever title shall be prepared by knowledge of the structure and physiology of the human

body and of the diseases to which it is subject. Let this preparation be satisfactory to the State Board of Examiners. The man with such knowledge may be allowed to practice as he elects. But he must recognize that the law imposes upon the practitioner the duty of possessing and using that reasonable degree of learning and skill which is ordinarily possessed by physicians and surgeons in the locality where he practices. (Pike-Honsinger 155 N. Y.) This is an educative and legislative matter, it involves broad interpretation and enforcement of the Medical Practice Act or, better a drive to reconstruct and strengthen the Medical Practice Act. Further, the public should recognize that treatment is less important than diagnosis, that correct diagnosis must precede any treatment. Of course, any man or woman may safely massage, twist, wrench or electrify the neck, limbs, spine or abdomen provided there is no pathological process present which will be increased by such activities or may advance as the result of delay. If however there is bone tuberculosis, early cancer or an acute pulmonary infection the failure to recognize the true condition may and often does result fatally. Therefore everyone treating disease by any method should be qualified to diagnose disease. Everyone, therefore, who treats patients practices medicine and comes under the Medical Practice Act. The chiropractor appreciates the danger to him of such an interpretation and therefore states in his advertisements that "chiropractic is not the practice of medicine" (cf. Red Book, 1923). Yet in the same article is given the cause of smallpox, vaccination is decried and the treatment of the disease by adjustment of the vertebrae is logically portrayed. What more is involved in the practice of medicine? All this is in reality a matter of public interest, of public safety, and it is intolerable that the burden of the public protection should be placed entirely on the shoulders of the medical profession. Law makers and the press cooperate enthusiastically in financial laws, prohibition propaganda and such but are relatively inert and uninterested in regard to this question which involves the life and health of the community. It becomes our duty to fight for the protection of New York State from the character of malpractice that has been recently perpetrated in Connecticut. The members of the profession have a public duty in bringing to the attention of the authorities knowledge of illegal or incompetent practitioners. The *Times* of November 22nd quoted a prominent Connecti-

\*Address of President read before the Medical Society of the County of New York January 28 1924

cut physician as saying that the prevalence of bogus diplomas and unlicensed physicians had been known for some time to many physicians in Connecticut, but that it had been a condition to which the public and the legislature had remained indifferent. The same paper states that the death records of a single town show that one bogus diploma practitioner signed six death certificates in eleven months. These serious and fatal cases were treated by a man who was, in medicine, uneducated and untrained. It is for the public to prevent such occurrences in this State. It is for us to stimulate the public to bring appropriate pressure to accomplish this through our legislature.

Among the suggestions under consideration for strengthening the Medical Practice Act are:

- 1 A system of inspection through inspectors appointed by a state department to uncover unlicensed practitioners

- 2 Prosecution through the Attorney General

- 3 Registration of physicians each year. The merits of these and similar propositions cannot be estimated without careful study. They should have your serious consideration.

There has been considerable discussion of pay clinics. Just what constitutes a pay clinic has not been defined and much confusion exists in regard to it. There are several types:

First—Those which confine themselves to special types of diseases, charging sufficient only to cover expenses. This group is not generally discussed. Many institutions, including my own, operate this type. Certain specialized subjects demand specialized lay assistants, medications and tests, others involve new principles which require cooperative investigation and research to determine the best methods of treatment. There must be a charge sufficient to cover expenses or the clinics cannot function and the public will be neglected. The general practitioner is not prepared to give appropriate services. Therefore, clinics in such conditions as diabetes, diseases of the thyroid, hay fever, asthma and other forms of hypersensitiveness are not only justifiable, but necessary.

Second—Those clinics which restrict their activities to reference and diagnostic work. This group must meet with universal approval.

Third—Those which treat all cases irrespective of whether or not the patient is referred by a doctor. It is upon this group that opprobrium has come to rest. Such a clinic, which does not stop at diagnosis on referred cases, but does everything for all comers comes into direct competition with the local practitioners. From the standpoint of the public such a clinic is attractive, in that the charges are relatively low, all specialists are under one

roof, so that a complicated diagnosis can be expedited, and the qualification of each worker is vouched for by the institution. Moreover, the well-equipped clinic affords an opportunity for the scientific study of medicine in the nature of post-graduate work. Such are some of the advantages.

What are the objections? It is stated that such clinics cut down the revenue of the medical men of the community. This contention, however, should not be urged without due consideration of the welfare of the public and this over a long period, even when you and I have passed from the stage. Look ahead, therefore, 20, 30 years, assume that pay clinics have then become general. They will pay salaries, but these must be small. The young man contemplating a career will see the mass of people of moderate means going to pay clinics. He sees the men working in them on small salaries. He appreciates that the first essential of a career—namely, a respectable living—is not offered. He turns his back on medicine and turns to that which is better in terms of dollars, the reduced number who embrace medicine will depend largely upon industrial, insurance and commercial jobs for their upkeep, in which case they are killed for scientific medicine. Of course, the least desirable men, those to whom the commercial inducements are the strongest, will be most affected, but the deterrent influence will affect all classes. To the community this will mean a dearth of doctors. The rural districts have this now for other reasons, the cities will have it, in my opinion, if pay clinics become general. But it seems unlikely that they will become general for the following reasons. Regularity, enthusiasm and interest on the part of the doctor are essential to hold patients either in a clinic or in a private office. These qualifications cannot be perpetuated for long periods by small salaries, and large ones are prohibitive. The stimulating influence of scientific leaders will not be permanently present in the clinics to compensate in training for that which is deficient in salary, for it is a matter of common knowledge that outstanding men quickly rise to heights beyond the dispensaries, leaving the mediocre men struggling with the routine. Finally, the burden of expense will prevent the popularization of pay clinics. Such clinics, then, seem prone to die of these inherent weaknesses. If they are killed, the murder will excite sympathy, for the public, viewing only its immediate interest, wants them, if they die, the object lesson will be of permanent value. It seems best, therefore to allow the experiment to continue.

Preventive medicine is one of the most important steps towards general health and happiness. This is furthered to a large extent by

periodic examinations of all individuals. An institute which does this is subject to criticism. But why not recognize the desirable features of this policy, and as practitioners of medicine teach such precepts to our patients. The medical schools have under advisement the question of instruction in such routine health examinations. The coming generation of medical graduates will doubtless be fully prepared and stimulated to carry this out. But you can do this now quite as well, if not better, than an institution. The trouble is you have not been alive to the importance of so doing. Our aim should be to improve our individual and collective services to the community, thus securing and retaining our following rather than to stand pat and attempt to retain our clientele by eliminating competitors. The race should be run and won by superiority, not by default. But the ethical practitioner should not be handicapped by advertising which is forbidden to him but is indulged in by certain competing groups.

Efforts are being directed more and more to the development of questionable types of group medicine. Since no individual assumes the responsibility, commercialism is unrestrained. One sees this in the institution which suggests that when cases are referred to a doctor his bill will be collected for him and 25 per cent deducted for services. Few individuals would consider doing this. The division of responsibility however softens one's sensibilities. The dictum in unity there is strength applies to the crooked as well as the straight. Here in New York wide opportunities are offered for commercialized medicine. Many such

propositions are couched in attractive terms and so subtly as perhaps to allow the sinister features to be overlooked. It is therefore, up to the members of this Society scrupulously to avoid joining or lending their names to ventures which thus reflect upon the profession.

The popularization of *broadcasting* has opened a field of responsibility and opportunity in that educational medical information, especially instruction in preventive medicine, may be transmitted to all corners of the country. We must strive, however to prevent this avenue being used for individual exploitation and objectionable propaganda.

*Conclusions.* Our obligations, then demand constant observance of high standards. It is unnecessary to outline the means for the improvement of the individual. The opportunities are ever present. The group or society can improve by harmonizing with other similar bodies for the unselfish attainment of high ideals: the purification of the profession, the uplift of education. It must view both sides of each question. Its first objective must be the interests of the public.

It is striking that some outstanding individuals in the profession refuse to participate in organizations whose sole aim is community interest. The fact that there are features to criticize within the organized body should not repel but rather attract such men to the work with the object of lending their influence to the correction of existing weaknesses. The good citizen should contribute and not quiescently accept the protection and privileges which accrue to him through the efforts of others.

## THE PERSISTENT PUERPERAL MORTALITY \*

By ROBERT DICKINSON M.D.

NEW YORK CITY

ACCORDING to the mortality statistics as compiled by the United States Census Bureau the lethal rate from puerperal causes for 1 000 live births in the birth registration area of the United States has been increasing. The statistics for the period from 1915 to 1920 are as follows:

### Death Rate per 1 000 Live Births

Year	Total Puerperal Causes	Puerperal Septicemia	Other Puerperal Causes
1915	61	24	37
1916	62	25	37
1917	63	26	37
1918	89	23	66
1919	68	23	45
1920	76	26	51

Puerperal septicemia remained practically stationary through this period and was not affected during the influenza year when the mortality from puerperal causes was exceptionally high.

The census report publishes statistics for the same years for England and Wales, Australia, Ireland, Japan, the Netherlands, New Zealand, Scotland, and Sweden. All these countries show a considerably lower death rate. The highest death rate in the group of the foreign countries is that of Scotland in spite of the fact that the death rate from puerperal septicemia is only half what it is in this country.

According to the statistics of the Health Department in this city, the puerperal death rate has likewise been increasing, although the rate is considerably lower than for the country as a

\*Read at the Annual Meeting of the Medical Society of the State of New York in New York City May 23, 1923.

whole The following are the rates per 1,000 births, live and still

1915—	4 8
1916—	4 5
1917—	4 4
1918—	4 6
1919—	4 7
1920—	5 1
1921—	5 3

The following table indicates the decrease in the employment of midwives

#### *Statistics of Midwives in New York City*

Year	No of Midwives Registered	No of Births Attended by Midwives	Percent of Total Births
1909	3,131	49,616	40 35
1910	1,515	51 996	40 28
1911	1,488	51,756	38 48
1912	1,325	52,743	38 88
1913	1,488	50,364	37 27
1914	1,488	52 997	39 69
1915	1,469	49,915	35 34
1916	1,799	46,487	33 78
1917	1,656	47,525	33 60
1918	1,612	36,720	26 60
1919	1,695	41,876	32 10
1920	1,517	36,369	26 60

The statistics of the Health Department indicate that a smaller number of puerperal deaths occur in cases attended by midwives than by physicians In this city this is undoubtedly due to the fact that the difficult cases of labor are delivered by physicians In a study however, made by Dr Julius Levy for the State of New Jersey and published in the *American Journal of Public Health* in February, 1923, the statistical procedure was to charge to the midwife all cases in which the midwife was called in, even if the delivery was made by a physician, and if she had nothing to do with the case The study led to the following conclusions

(1) That the mortality rates are not unfavorably influenced by the percentage of births attended by midwives,

(2) That the lowest rates are frequently found in cities and counties with the highest percentage of births attended by midwives,

(3) That even among primiparae the puerperal death rate is lower among women attended by midwives, and

(4) That the puerperal death rates by nativity of mother are lowest among those groups that have the highest percentage of births attended by midwives

Dr Levy believes that something more should be done to meet the situation than adequate training of physicians in schools and hospitals He states that in certain types of practice the young physicians neglect their technic and develop methods and practices which are time-saving but frequently disastrous to the patient He indirectly suggests a method of supervision similar to that which yielded encouraging results with midwives Then the question arises—how is this supervision to be carried out, through the county medical societies, through a special group of consultants, or through the Department of Health? In a paper published in the *Medical Record* of April 23, 1921, Dr Abraham J. Rongy describes at length the slovenly type of obstetrics practiced by physicians in the Bronx

The maternal mortality rate in the hospitals of this city is lower than the general mortality rate and is particularly low in the hospitals devoted to maternity

There are no available statistics indicating the extent to which births take place in hospitals, but the proportion is undoubtedly increasing, and with the increase in the so-called "prenatal work," the rate should decline

In analyzing the situation, one comes to the conclusion that the most important factor requiring particular attention is the physician delivering the woman in her home We maintain strict supervision over the work of the midwives, and hospitals are endeavoring to combat the influences which have been responsible in some instances for a high mortality Prenatal work is being likewise developed and standardized

## HISTORY OF A BLAND REQUEST—A SYMPOSIUM ON CHIROPRACTIC EDUCATION

LOUIS J BRAGMAN, M D, Kings Park

### ONE FOR ALL—ALL FOR ONE

Why study chiropractic? Why not, indeed?

One fated day, while perusing through *Life's* pages, my eye caught a small square of advertisement towards the back of that magazine It said—among the other things "Write for Chiropractic literature"

I did! Here are the consequences

First came a letter, under the heading "The Uni-

versal Chiropractors Association—One for All—All for One," giving me fair and frank warning "Your name is to be sent to each of the ten schools which are supporting our advertising campaign, and you will doubtless receive literature from them relative to the merits of their respective institutions" Only ten? The other fifty of the "Sixty chiropractic schools in the United States, with a very small number of

accredited or desirable ones" are not to bask in the sunlight of this associated advertising campaign! This is so, because only "those in the list we are using are acceptable to the Association and we do not hesitate to recommend them for your consideration"

Considerate enough On then, with the Trusty Ten!

## I

### THE FOUNTAIN HEAD

Inasmuch as one B J Palmer is secretary of the Universal Chiropractors Association is it to be wondered at that the first of the "literature" to arrive bears the postmark of Davenport, Iowa? "Your name has been given us (someone has glanced over his own shoulder) by the U C A, as one who is interested in the Science of Chiropractic as a profession and contemplate taking up this work" (The bland request begins to expand) If you are a "truly ambitious man who would break the fetters of dependency \* \* \* (then) you are eligible to our Scientific Course \* \* \* tuition for which is \$400 00"

How can one help but feel elated at the prospects, realizing further that the Palmer School is "Universally recognized as the hub of all things chiropractic \* \* \* and a diploma from this institution (the Palmer School of Chiropractic) stands primarily for two things The most thorough training offered in the world today in Chiropractic, and an absolute adherence to a fixed standard of grades and attendance" Consider the teaching staff—"every man is a specialist in his particular subject," and as an added mark of distinction carries the exalted title of philosopher of chiropractic (Ph C), consider "Our High Standards—the standards of Chiropractic are high, and they should be"

And consider the curriculum which includes philosophy—"which has been defined as the questioning and answering of the why of things conditions or affairs either human or divine," physiology, of all the subjects studied physiology is, perhaps, the most common to the ordinary man" gynecology, "there is no question but that diseases of women are of great prevalence and that a great deal of the practice one is required to meet is of this character", salesmanship 'of what benefit is a graduate chiropractor if he does not know how to sell his specialty?' and consider the microscopical department 'for instance, a patient asks what the effect is in pneumonia or in some other disease, a chiropractor educated at the Palmer School is able to describe disease minutely'

All this and more for \$400 00 But wait—what's a wife worth? 'Husband and wife both enrolling at the same time, \$500 00!' Are you still hesitating to "break the fetters of depend-

ency'? Then read the glowing testimonials, of the true patent medicine variety, from one who was "saved from the scrapheap" by becoming a Palmer graduate at 62, from another who "grew old and independent by matriculating at 64 (and only last week I saved one from the operating table for appendicitis), and another who "made more money in my four years' of chiropractic work than I had made in twenty years in my former work" and from countless others who cannot too fully express their joy and gratitude!

Are you still unmoved? Remember, 'the question is, whether you want to get chiropractic first-handed, or whether somewhere between second and twenty fourth handed will suffice to save human lives? And where else study first-handedly than under the recognized leader of the chiropractic profession, who though 'maligned, abused, disqualified and seriously threatened on every hand—was he not sapping the life blood of the powerfully organized medical fraternity,' nevertheless has emerged unscathed and "a lovable character," addressed as he is by his fond students and associates "simply as B J P"?

But that impulse must not be obeyed too hurriedly as there are other supporters of the advertising campaign, who in all fairness, must be given a chance!

## II

### IN THE LATIN QUARTER.

The Mother School stayed at home, but the National College of Chiropractic, although "founded in Davenport \* \* \* was transferred to Chicago to secure the clinical, laboratory, dissection, hospital, and other facilities and advantages that were lacking in a small town" Not only that, but remember "it is situated in the center of one of the largest districts in the world devoted to the healing art \* \* \* the so-called 'Latin Quarter of Chicago'" And noting further 'that Chicago has a surprisingly moderate climate' who can withstand the temptation to fly there immediately?

But even so the wheat must be separated from the chaff While 'students of the National College are admitted to all the clinics and autopsies of the ——— Hospital \* \* \* witnessing the operations it is true, is of no value to a chiropractic student so far as their technic is concerned, as chiropractors are not interested in surgery and medicine."

What they are interested in lies in the hands of a faculty "composed of eighteen members nearly all are men and women of academic, medical and chiropractic training, and hold a license in one or more States" (Of the fourteen men on the faculty six sign after their names M D and one D O) They are absolutely competent to take one through a "full collegiate course of eighteen months' leading up to the degree of

"doctor of chiropractic" However, any student who wishes to leave at the completion of the Junior year (at the twelfth month) will be dubbed simply "chiropractor" On the other hand, for those who wish to "question and answer the why of things," if "a general average of ninety per cent" is obtained, and "a thesis on the Philosophy of Chiropractic, consisting of not less than ten typewritten pages" is submitted, the euphonious title of "philosopher of chiropractic" will be conferred

The royal road to success leads through the following subjects "Anatomy, (which) is the keynote to Chiropractic", Bacteriology, which is "that branch of science which has to do with the study of those minute organisms that are a contributing or exciting factor in the production of disease", Chemistry and Toxicology, which course is "very comprehensive, and yet not complex", First Aid and Minor Surgery, which "no student is obliged to take", and Obstetrics, which is "taught, not in the expectations that students will practice mid-wifery, but \* \* \* that they may recognize pregnancy" Not to omit "Philosophy, with which every department is permeated"

So much for the scientific end of it Thick and fast come a series of follow-up letters, expressing appreciation of "your interest in the National College of Chiropractic," and anticipating "the pleasure of numbering you among our students" Beware of "the catch-penny slogans" of other chiropractic schools, which "give the prospective student the impression that they have a monopoly, as it were, on all things Chiropractic" (An obvious slap at the Fountain Head) Further, becoming impatient at lack of responsiveness—"we would greatly appreciate an expression from you as to when you contemplate taking up the study of Chiropractic \* \* \* The cause for your delay, as we see it (sic), must be a purely personal one Write us about your particular problem and more than likely we can be of assistance in helping you to decide" After a brief respite, "we presume you are not in a position to begin your studies at this time" \* \* \* Hence, why not let us sell you two books (one is "Stedman's" medical dictionary) at \$15 50, "so that a positive advantage in your studies at a later date, may be obtained" Why not enroll, any way, for a future date? Or not falling for this, why not enter our evening course?

Perhaps Philosophy could give the reply!

### III

#### THE CITY OF ROMANCE

Leaving the "surprisingly moderate climate of Chicago," we embark for San Antonio, where the Texas Chiropractic College flourishes, where the "mean average temperature for the year is 69 9", and where there is an atmospheric pressure of

29 99" (For further details, says the catalogue, confer with the Chamber of Commerce)

"We have learned," a communication states, "that you are interested in the study of chiropractic \* \* \* You naturally wish to go where the advantages are the best" Therefore, do not overlook "our location in historic and romantic San Antonio" Lurid inducement!

"It is a pleasure to know you are considering chiropractic as your life's work Our college teaches a most thorough and complete course, \* \* \* it stands above other colleges in the close personal attention given each student and in its ideal location in the city of San Antonio"

One enticing epistle follows another, until the supreme is reached in a "Dream Book" "Slip away to some quiet corner and read (it) in a spirit of reflective meditation" It will soon draw you "out of the rut" Which is easy enough, for "the only mental equipment necessary before entering any of our classes is an ordinary common school education or its equivalent"

But it is pertinent to remark that "we never allow our social affairs to interfere with the studies" An atmosphere can be too romantic!

### IV

#### THE STANDARD OF THE EAST

"As one experienced chiropractor put it 'Start right, or don't start at all Go to the Palmer School in Davenport, or to the Eastern College of Chiropractic in Newark'" And you can't go wrong in New Jersey, for the college there "stands in the same relation to Chiropractic as Johns Hopkins does to medicine, and as Oxford does to literature \* \* \* Shorter, cheaper, and less thorough courses may be had in other colleges, but not here", yet, nevertheless, the circular insists, "you can become Doctor of Chiropractic easily and quickly, \* \* \* start now—and in a few months' time you will be graduated" How the "Standard Course (which) consists of three years of six calendar months each" is condensed down to a few months all told, is part of the mystery that makes the school "one of the two chiropractic institutions whose superiority is unquestioned, and further serve to make it unique among chiropractic schools"

"The chiropractor who has graduated from the E C C practices no recondite method, (and) doesn't hide his science in a lot of Latin terminology or formulæ" And, furthermore, the College "has no special course for the medical physicians, osteopaths, nurses, dentists, or other professional people" because "experience has shown us that such practitioners are no better fitted to learn chiropractic properly than intelligent laymen" Therefore, "medical men who will sit next to you in class will be required to pursue the same studies and spend the same length of time here as you"

He will have to ponder, simultaneously, over chiropractic philosophy (once more) "which colors the teaching in every department, over Histology, which tells how "every part, organ, and tissue of the body is made up of cells built up in formation", over Neurology, under which heading "diseases of the nervous system are also included", and over Anatomy, which will reveal "that many statements of the greatest medical authorities are inaccurate" In brief the non layman will be introduced to a science which is so perfectly simple that a child could see its rationality."

But do not imagine enrollment to be a mere matter of money, for "only persons of good moral character (are) accepted for matriculation and unless you can show at all times a correct and dignified deportment as befits a professional man or woman" you must be prepared for disappointment.

And a final thought "Don't consider cheap courses, that enable you to barely squeeze through and leave you bewildered in the presence of a critical questioning public. The Eastern College, 'unique among chiropractic schools, will prevent such a situation!

## V

### FROM MISSOURI

Comes the *News*, published in St. Louis by the Missouri Chiropractic College. "Our October enrollment must be two hundred," says the back page (the rest of the magazine being divided 'twixt chiropractic science and chiropractic advertisements). It must be so because "our College is one of the largest and best equipped institutions of its kind and is rated as one of the foremost Chiropractic Colleges in this country."

Every man his own rater. "The Stamp of Approval" is put on "but six, namely The Missouri Chiropractic College, The Palmer School of Chiropractic, The Eastern College of Chiropractic, The Texas Chiropractic College, The Ratledge School of Chiropractic (Los Angeles), and the Canadian College of Chiropractic (Toronto). That Missouri is first named is no mere coincidence, in view of the all-important circumstance that "the faculty of this college is composed of men possessing remarkable ability." Substantiation of this assertion, however, is only forthcoming on filling out a "blank prospect slip" as no literature is needlessly squandered on the idly curious! Obviously the Missourians must first be shown

## VI

### QUE VOULEZ VOUS?

Is not the 'Ratledge System of Chiropractic Schools' in California? Hence, is it not in "an ideal location for a chiropractic school? \* \* \*

The equable climate makes each school day en joyable. Ocean and mountains \* \* \* and Los Angeles, Senorita of the South. As the French say, "Que voulez vous?" True enough!

"Much credit reads the Annual, the climate off its chest 'is due to those men who have collaborated with Dr. Ratledge during the last fourteen years, notable among whom was his friend D. D. Palmer." Honor where honor is due. But despite the notable collaborations one can still soar free and independent, since "all opinions truly about chiropractic are private opinions. The Ratledge school has something to teach and teaches it, and has no fear of being charged with reflecting private opinions." Fearless ever, he allows "no M. D., osteopath or other therapeutically educated person to enroll as a student, because when once the erroneous theories of medicine have been accepted as true and basic it is practically impossible to divest himself of what he honestly believes to be scientific facts for a sufficient length of time to ever grasp the great truths of their philosophy." Thus does the therapeutically educated person reach the end of his gamut battered from acceptance to tolerance and now to disdain!

Having, then no erroneous theories to divest oneself of it is consoling to learn that in order to qualify for matriculation in this school, \* \* \* character, honesty, mental poise, and mental capacity are essential. Academic training and the mental discipline it brings are helpful. We hold that it is un-American to require that knowledge shall have been gained in any fixed manner in order that the individual may be permitted to join in the march of progress. \* \* \*

The curriculum throughout is comprehensive. Each member of the faculty is selected by Dr. T. F. Ratledge, President of the R. S. C. S., with the greatest care and after close observation, and "has exclusive access to Ratledge's technique and superior system of adjusting, and to his complete and highly scientific philosophy of chiropractic, which will undoubtedly become the future standard for the profession."

Que voulez vous?

### THE MARCH OF PROGRESS

Thus ends the history of the bland request. The last four supporters of the grand advertising campaign are missing, and sunk into oblivion are the insufferable and undesirable remaining fifty. But the noble half dozen provide ample reflection for him who desires to question the 'why of things'. In these blurbings of bounteous climate, excursions into pseudo science and dabbings into philosophy at ten pages a throw, are revealed the inner workings of an even greater American fraud than Samuel Hopkins Adams once so mercilessly laid bare!

## THE LEGISLATIVE BILLS

The last two issues of this Journal contain descriptions of twenty-seven bills that have been introduced into the Legislature on subjects directly affecting physicians, and this is only the beginning of the session. Dr. Vander Veer, Chairman of the Legislative Committee of the Medical Society of the State of New York, has a herculean task to keep track of all these bills for his own information, but to keep the members of the State Society fully informed is an impossibility. Fortunately, most of the bills are not important, and do not affect procedures by physicians generally.

The great mass of the work of Dr. Vander Veer is done quietly and with no publicity, and the same is true of the work of President Wightman, Secretary Hunt, Treasurer Milliken, and all the other officials of the State Medical Society. The editor is appalled at the amount of time and effort which the leaders

are giving to the State Medical Society. Most of the work is of a routine nature, and a description of it makes dry reading, but we are planning to make regular reports of the activities of the officers and committees. When the members realize the disinterested faithfulness of their officers, every member will be inspired to do his part as quietly and efficiently as the leaders are doing theirs.

The principal activity of the State Medical Society at present is along legislative lines. The principal bill of all is the Medical Practice Act. The great stimulus to that bill came from the exposure of illegal practitioners in Connecticut, and was aided by the prosecution of a chiropractor in Brooklyn. The bill is comprehensive, and much careful research is required to perfect it. Mr. Whiteside, counsel for the State Medical Society, is giving days to its perfection. To delay the publication of

the bill for a few days is better than delays of weeks in reshaping it after an imperfect bill has been introduced

Discussions of the Medical Practice Act in County Medical Societies seem to have been confined to one feature of the bill that requiring the registration or certification of physicians licenses. Doctors generally are annoyed with this feature of the bill and strongly desire its elimination. However, the registration feature is only an incident in the bill and the reasons for its inclusion are largely historical.

It is a fundamental principle of American lawmaking that new laws shall be a development of old ones. The great mass of common law consists of court decisions regarding former laws, which must be respected no matter what new legislation is passed. To adapt a new law to old historical conditions is always easier than to create entirely new laws and decisions. Some features not one hundred per cent desirable will necessarily be incorporated in the Medical Practice Act, simply because these same features are in other statutes relating to similar subjects. For example the imposition of a fee for registration is undesirable,

but it is imposed on seven or eight other professions, and to remove the imposition will involve the changing of seven other laws. While a doctor will be annoyed by the registration fee, let him remember that his insistence on its elimination is annoying to the lawmakers on whom physicians must depend for relief. A physician may consider the fee as part of the purchase price that he pays for the passage of an efficient Medical Practice Act. Every physician loses two hundred dollars a year from his patients who seek chiropractors, and one per cent of this, whether it is rightfully or wrongfully collected, is a small percentage to pay for the returns to himself. The leaders of the State Medical Society are earnestly striving to secure an adequate Medical Practice Act, and they believe that physicians will lend their hearty assistance by minor sacrifices and by active work in favor of the bill.

The Medical Practice Act will be published in full as soon as Mr. Whiteside has perfected its legal aspects. Let each member defer judgment until he has considered the bill as a whole in the light of the historical development of its salient features. F O

### "MASQUERADERS"

From the 'Fountain Head News' of January 26 on page 2 we learn that 'The fighting that we have been going through for the past twenty-eight years has taught us that it does not pay to use 'Dr' as a prefix nor to use the word 'cure treat or heal,' and to in other ways misrepresent ourselves to the public. It always leads to trouble that costs us dearly when we ignore these sensible and sane precautions.

'The Fountain Head News' carries on the play by announcing its publication date as 'January 26, A.C. 29' which we hazard a guess is the 29th year of 'Chiropractic,' whatever that really means.

The instructions on pages 14 and 15 of the same issue suggest a course in music with possibly the xylophone as the instrument, all in a 'major' key, and as they jump from spine to spine they tune or adjust not "cure or treat or heal" either "Pls," "Pl," "Prs," "Pri," "Pl," or "Pr," and describe the pathologic conditions they tune up or adjust or play upon not 'cure or treat or heal' in a most curious jumble of popular, or indefinite, or scientifically technical terms.

The scientific terms used have been evolved through the study of medicine through the ages,

the common terms are evidently for the popular understanding of their plumber and blacksmith practitioners, and the indefinite terms are possibly lures to further courses under 'B J' as the head of the school likes to style himself.

While the case histories are jumbled statements that any first year medical student would be ashamed of there is evidently an attempt to camouflage the idea that they are practicing a system of healing the sick and thus invading the field of licensed medical practice.

Masquerading under a group name and pretending not to do things controlled by laws regulating the practice of medicine, and therefore in no culpable sense violating law or requiring license they carry signs in their windows advertising themselves as doctors of sorts, inviting the credulous or inexperienced to consult them or to bring their children sometimes in a grave emergency, such as diphtheria, or nephritis, or endocarditis, and then carry on treatments for these dangerous conditions which would qualify a regular physician for ostracism or jail.

Strutting outside of the law and disguised in a cloak of professionalism, how they must enjoy the limitations of the regularly licensed physician!

N B V E.

## STATE AID FOR PUBLIC HEALTH WORK IN COUNTIES

The New York State Legislature of 1923 passed a law giving State Aid to rural counties that undertake to establish local hospitals and laboratories and do other work for the diagnosis and treatment of disease.

The passage of this bill marked the first close cooperation between the organized physicians of New York State, the State Department of Health, the Governor and the lawmakers. The initiative for the bill came from the State Commissioner of Health who reported an increasing shortage of physicians in rural sections of the state.

Acting on the report Governor Smith called together a number of representatives of every county medical society and the State Department of Health to consult with him personally regarding the diagnosis and treatment of the medical conditions in rural counties. The conference was held on February 26, 1923, and as a result the Governor appointed a Committee of Fifteen, chosen from the State Department of Health and the State Medical Society, who should prepare a plan of action to be adopted by the State.

This committee reported that rural counties need hospitals, nursing and laboratory facilities, and that the counties should meet their own needs, and if they cannot do so, then, and only then should subsidy and central control be provided. The Committee further recommended that the State Department of Health adopt "an extensive educational campaign to urge the local county authorities to meet their own needs." The report of the committee is found on page 220 of the May, 1923, issue of *NEW YORK STATE JOURNAL OF MEDICINE*.

Governor Smith accepted the recommendations of the committee and on April 11th he sent a special message to the Legislature recommending a law authorizing the State to duplicate the money raised by a rural community, either for small community hospitals or public health activities of any other kind. This message was printed on page 219 of the May, 1923, issue of the *NEW YORK STATE JOURNAL OF MEDICINE*.

The Governor recommended that the aid be limited to those counties which had no cities of

the first or second class, thus practically defining what is to be considered a rural county. He also suggested that the State Commissioner of Health should be the judge of the standards to which the counties must conform in order to receive state aid. The Governor added "no existing project would be eligible for State aid, as the purpose is solely to stimulate new undertakings applied to rural conditions in the field of public health."

The Legislature acted on the Governor's message and passed a law embodying practically all the Governor's suggestions. The State Department of Health has conducted an educational campaign along the lines suggested by the committee of physicians and has had numerous requests for duplication of the funds expended by rural counties on public health projects. The Governor's wish to stimulate public health work in rural counties has been abundantly fulfilled.

The State Department of Health has had to decide local questions that have arisen in connection with the execution of the law and therefore minor amendments have been introduced in order to clarify some of the general provisions of the law. This new bill is the one introduced by Senator Love, Print No 128, and by Assemblyman Lattin, Print No 232. It is printed on page 82 of the February 1st issue of the *NEW YORK STATE JOURNAL OF MEDICINE*. Under the Department of News Notes of this issue we are printing a letter from Dr. Brooks, Deputy Commissioner of Health explaining the proposed amendments.

Some physicians seem to think that the bill will place the expenditure of the County funds in the hands of the State Commissioner of Health. Dr. Brooks says "There must of necessity be someone authorized to determine what projects especially merit State aid. By inference the Commissioner of Health now has this authority. The proposed amendment establishes the fact definitely." We are sure that the physicians of New York State wish no one else than the Medical Department of the State government to pass upon applications for State aid of Public Health work. F O

## CHIROPRACTIC ARGUMENTS

We have just received an illuminating article entitled "History of a Bland Request: A Symposium on Chiropractic Education," by Dr. L. J. Bragman of the Kings Park State Hospital, and we are printing it on page 162 of this issue. The article is apropos at this time, for it affords an excellent setting for a discussion of the Medical Practice Act. Dr. Bragman describes in a lively

style his experiences in corresponding with chiropractor schools. He shows the shallowness of their pretenses and the ridiculous and mercenary nature of their appeals to students to register and study chiropractic.

Read the article in order to prepare yourself to discuss chiropractic with intelligence and interest. F O

## LEGAL

### CHIROPRACTIC LIVES AND THRIVES ON PUBLICITY

Some time ago we said, 'Chiropractic lives and thrives on publicity. Without publicity chiropractic would have gone the way of earlier delusions and superstitions long ago. Chiropractors have learned that the people seek quick return to health by magic cures are impressed by testimonials and put their faith in promises of quick and marvelous results. The chiropractor seeks to break down the public's belief and faith in science, in order to rear and build a new faith in his claims. The chiropractor knows that the ethical medical practitioner cannot reach the public through the advertising columns of the lay press but must make his name procure public support and confidence by his works rather than by his words. One of the chiropractic schools recommends to its practitioners a principle of advertising, which is 'He that bloweth not his own horn—for him no horn shall be blown.'

The Penal Law of this state Section 421 makes it a misdemeanor for a person by advertisement to make "any assertion, representation or statement of fact that is untrue, deceptive or misleading."

In the case of the merchant who violates this section proof is quite simple. If his advertisement represents that a certain garment is all wool when in fact it is cotton, or that fur is real when in fact it is cat skin, or that his merchandise is of certain quality when in fact it is of a much lower quality, the falsity of his claims is readily susceptible to proof that can be easily grasped by the average layman. Prosecutions of merchants therefore, under this section of the law have in many instances been successful and the tone of commercial advertising by the class that the penal law only influences as a result has greatly improved. It is a strange fact that while the advertising of merchants generally has been on a higher plane, advertisements of unlicensed and unqualified practitioners of various cults have become more glaringly offensive and this section of the Penal Law has been of no value in suppressing the quacks' advertisements. Were the chiropractor to advertise "I cure diphtheria by adjusting the fifth dorsal" there can be little doubt that he could be prosecuted successfully for an untrue advertisement. He probably knows this so that he is not definite in what he states but is veiled and suggestive. He has been schooled by experts in the art of making his advertising copy so skillful that he escapes by a hair's breadth from stepping over the line into the criminal realm. His advertising is a type of

sharp practice that constitutes a moral fraud and probably not a legal wrong or if a legal wrong one difficult to prove. This condition probably explains why the principal schools of chiropractic have publicity departments in which are provided all types of advertising to be used by the chiropractic practitioners. Those in charge of these departments have evidently made a close study of how to impress the public mind without transgressing the law.

One of the pamphlets used tells of a chiropractor who wages a consistent fight against great odds with the 'school physician and Board of Education against the vaccination evil.' Articles of fiction are written interwoven in which is chiropractic propaganda in order to carry "the message of chiropractic." Some of this advertising material contains suggestions 'how to sell chiropractic to a prospective patient.' One of the mottoes sponsored by one of the schools is

Early to bed early to rise, work like hell and advertise makes a man healthy, wealthy and wise.' Then, also, a chart which states that the medical slogan is "Keep off the grass" and the chiropractic slogan "Keep from under the grass." A system of yearly subscription at the rate of ten dollars a year brings this advertising material to the practitioner's door, so that the chiropractor may receive on the first of each month all the copy he needs for his newspaper advertising during the ensuing month. In this regard they state "There is nothing cut and dried about the copy. Each member is given real personal service and is furnished with copy that is especially adapted to the needs of his own particular locality. Your newspaper man does the rest as it is to his interests to display the copy in as attractive a looking advertisement as possible."

As opposed to these methods of the chiropractors consider the provisions of Section 31 of the Principles of Professional Conduct recently adopted in this state by your Society.

Advertising. Sec. 31. Physicians should not make use of special cards or any other form of advertisement for the purpose of inviting attention to themselves; they should not boast of cases, operations, cures or remedies nor aid or permit the publication of any of the foregoing in the public prints."

Legally the physician has much more right to advertise than has the chiropractor but he refrains from so doing because, as a class physicians recognize that there are even higher obligations imposed upon them than a mere mandate of the laws that their profession must be conducted on a high ethical plan that success

must come as the well-deserved reward of learning, skill and effort. The physician, therefore, governs his life and conduct by principles that should entitle him to respect and public recognition. The physician and the chiropractor are, therefore, as far apart in the conception of their duties and obligations to the public as are the two poles. The physician is not satisfied simply with keeping within the law, but strives to conduct himself according to the higher principles

of ethical conduct. The chiropractor apparently seems content with keeping out of jail. He can, by playing upon the fears, the credulity or the distress of the afflicted enrich himself financially and by artifice, shrewd counsel and cleverness escape the heavy hand of the law. The physician and the chiropractor have no common ground upon which, therefore, they can meet and no purpose in common in their relation with the public. G W W

### BURN FROM GREEN SOAP

The defendant conducted a small private hospital to which the plaintiff went for her confinement.

It is claimed that in the necessary preparation of the parts for delivery the nurse was negligent in the application of green soap and in shaving the plaintiff resulting in a burn upon the plaintiff's leg and thigh. The plaintiff's confinement and delivery were otherwise normal except for the claimed reaction of the green soap, which the plaintiff claimed caused blisters lasting for many weeks, causing her great pain and resulting in scarred tissue.

Upon the trial it was shown that the nurse who had prepared the plaintiff was competent for this type of work having had about seventeen years of experience, that the green soap which

was used was properly prepared chemically and like soap had been made and sold by the manufacturer for a number of years. It was further shown that in the absence of supersensitiveness green soap would not cause any burn or reaction. The plaintiff contended that strong lysol had been used by mistake instead of green soap. The jury awarded the plaintiff damages in a nominal sum.

The husband had likewise sued to recover for loss of services of his wife and for moneys expended because of the burn, but apparently the jury were not very sympathetic with the husband or his cause of action, for while he proved actual damages in the expenditure of certain moneys, the jury, most likely by way of criticism for his actions, awarded the husband six cents damages. G W W

### DEATH FROM POST PARTUM HEMORRHAGE

A general practitioner about a week prior to a patient's confinement was called to attend her and engaged for the confinement.

It was charged that the patient suffered from a post partum hemorrhage, which continued from the time of her delivery until her death. The physician was charged with improperly caring for the patient in that he improperly administered pituitrin failed to take the necessary steps to prevent the hemorrhage and did not remain with the patient for a sufficient time after the delivery so as to control the hemorrhage.

After labor had started she was seen one evening by the physician, who found that she was in the first stage of labor and that her condition was normal except for a tardiness of labor pains. He returned early the following morning, keeping the patient under observation for several hours, during the course of which a vaginal examination was made. He returned again in the early afternoon of the same day and determined that her condition was still normal and that she would be ready for delivery in about two or three hours. On his next call, in the early evening, a vaginal examination disclosed that she had made some progress in labor though the pains were more or less infrequent. After keeping the patient under observation for about fifteen minutes he administered hypodermically 1 c c of pituitrin.

This application of the pituitrin was effective and within three to five minutes thereafter the fetus was delivered normally, the placenta being likewise normally expelled. The delivery was not accompanied with any profuse amount of bleeding. He remained with the patient for about ten minutes after the delivery had been completed and left her in the care of her family. During the balance of the evening and until late at night he was busily engaged in his attendance upon other patients and did not return to the patient's home until early the following morning, when he was apprised of the fact that the patient had died the preceding night of hemorrhage.

A suit was subsequently instituted by the husband, as administrator, to recover for his wife's death. During the trial, which lasted for three days, a sharp conflict arose between the testimony adduced by the plaintiff and that of the defendant as to the length of time that he had remained with the patient after the delivery and as to the failure of the defendant to return to the patient after her delivery. The members of the family of the deceased testified to repeated efforts to get the doctor to return, of frequent telephone calls to his office and also a visit to the office for this purpose. The doctor had meanwhile been called elsewhere, he stated. The jury decided the issues in favor of the plaintiff, awarding damages for the death of the patient. G W W

# LEGISLATION

By James N. Vander Veer, M.D.

The question has often been asked of the members of the Committee on Legislation as to why and how they can devote their time without remuneration to the great interests of the medical profession.

The Chairman of the Committee has sought far and wide at different times for an answer to that question that would concretely make reply

to such individuals whose vision is limited by the horizon of their own little hamlet or circle and have come across the following article which appeared in the American Medical Association bulletin for January, 1924, and which is copied in its entirety for the perusal of the profession of New York State.

## MEDICAL IDEALS TO BE ATTAINED

Without ideals we accomplish nothing. Idealism is implied in Osler's definition of medicine and it is the propelling force which carries many physicians through their practice consciously or otherwise. The physician's native instinct of service makes him too often blind to the fact that materialism festers all about him and he leads a life which someone has described in these words: "The world does not owe me a living. I owe the world a life."

At the risk of repetition it might be well briefly to point some of the ideals which must be constantly sought after since they insure future advance.

(1) The ideal of keeping alive the scientific inquiry spirit in everyone. The business of scientific medicine is nothing more than the making of medical observations, classifying them according to resemblance in succession and summarizing them in their relation to the abnormal phenomena of disease. Vast opportunities therefore confront the general practitioner as well as the scientist to share in medical achievement and though all cannot be a Sir James McKenzie everyone can at least try to emulate his example. More and more must it be recognized that the ideas which stimulate research work come in large part at least from sick people themselves.

(2) The maintenance of an altruistic, optimistic, broad-minded outlook on life is a prerequisite to professional progress. One of the greatest glories of our profession has been its deep interest in the physical betterment not merely of mankind, but of man. The older philosophers of the Greeks submerged man to the interests of the state. The priest too often places the welfare of the church above that of the communicant. Physicians minister not only to humans at large, but to man himself. The moment medicine becomes egocentric, or the scientific spirit ignores the humanities, disaster is inevitable.

(3) The ideal of eradicating all forms of the

irregular practice of medicine is imperative. Irregular practice is by no means confined to the ever-growing horde of charlatans, quacks and healing cults. Physicians fight none too well that vicious form of thing which Robinson terms 'rationalizing,' that is finding arguments for going on believing as we already do. An insatiable credulity betrays the crime. The physician, although often forced to act without full knowledge, should never draw the cloak over his own ignorance. Any symptom of progress is a peg on which to hang the swindle. The use of some new chemical substance simply because it is vaunted by a crafty advertising manufacturer, the indiscriminating resort to thousand and one varieties of vaccines, the excesses of contemporaneous devotees to glandular therapy, the orgiastic intemperance of some psychotherapeutic fanatics, the pushing of specialization beyond its reasonable bounds, the organization of pretentious diagnostic groups which are incapable of performing the functions they promise—all these are a few examples of irregular practice within our ranks. It is very easy to prefer the evasive way of deduction from a *a priori* proposition, and hard to pursue the stony path of inductive science irrespective of where it leads.

(4) The ideal of fraternalism must be kept alive. Jealousy, criticism and intolerance lamentably weaken medical influence. Much can be done to perpetuate the tradition of a brotherhood by earnest attempts to create a scientific unity. This gospel must be preached especially to those backward members of the profession who rarely attend county, city, state or national medical meetings. Fraternalism with workers whose daily life is occupied not with the care of the sick but with the scientific study of conditions underlying such care, is quite as important. The benefits to be derived are equally reciprocal.

(5) The ideal of public service cannot be shunned. By oath physicians have pledged their support to the enforcing of laws and the sus-

taining of institutions dedicated to the service of humanity. It is their moral duty to give advice and to sit in council with others whose work concerns the betterment of community hygiene. Upon all questions of local public health their opinion should be openly and frankly expressed. It must not be forgotten that we are in a period of legislative morality and that the field of medicine has been a fertile one for the reformer, agitator and propagandist. The physician faces a serious menace in the spread of the idea that medical socialization will bring higher standards of health. Both political doctors and medical politicians are foisting subtle arguments and insidious pleas to secure public patronage. We pay a tax for the privilege of giving morphine to a patient in agony, but there is no evidence of the utilization of the money thus derived for medical uplift or the reclamation of unfortunate narcotic derelicts. It is no time to be complacent. The physician has nothing to fear in backing preventive medicine to the utmost.

(6) There must be no let down in ideals which govern our ethical standards of conduct.

(7) Finally, just a word about their personality ideal. We are, fortunately, beginning to

realize that what we think of as mind is so intimately associated with what we call body, that one cannot be understood apart from the other. Bodily reactions to emotional states are well recognized and the "unconscious" is probably but the domain, as yet poorly explored, of physiological changes which have escaped our notice. Hidden impulses, repressed desires, not always improper ones either, conflict with inherent instincts, influence conscious thought and physical fitness tremendously. We are apparently unaware of a great part of what we perceive, remember, will or infer. "The brain is the organ of forgetfulness as well as of memory," and the forgotten, or the habitual, constitute a great part of the so-called "unconscious," a psychic state, which far outruns in activity our conscious being. It cannot be denied that physicians, scientifically trained in the investigation of special organs or functions, take too little note of the emotional and mental reactions marking the actions of the human body as a unit. Until the study of human behavior and the personality factor becomes more animated and consistent a lack of logical motive in the work of many physicians is likely to continue.

## LEGISLATIVE BILLS

### SENATE

Senate Bill Int No 285, Print No 289, by Senator Morton J. Kennedy of New York City, concurrent Assembly Bill Int No 342, Print No 342, by Assemblyman Morris Weinfeld of New York. *THE Narcotic Bill*, is still in the Public Health Committee in each house, no action taken.

Senate Bill Int No 317, Print No S 321, by Senator Benjamin Antin, of New York City, concurrent Assembly Int No 370, Print No A 372, by Assemblyman F. S. Cole of Herkimer County, is still in the Public Education Committee in each house, no action taken.

Senate Bill Int No 347, Print No S 351, by Senator Bernard Downing of New York, concurrent Assembly Int No 567, Print No A 570, by Assemblyman Joseph A. McGinnies of Chautauque County, is still in Committee. No action taken.

Senate Bill Int No 376, Print No S 380, by Senator Henry G. Schackno, referred to the Senate Codes Committee is printed here in full for the information of the profession.

### STATE OF NEW YORK

No 380

Int 376

IN SENATE,

January 28, 1924

Introduced by Mr. Schackno—read twice and ordered printed, and when printed to be committed to the Committee on Codes.

### AN ACT

To amend the penal law, in relation to the name, sale, use and labeling of methanol, formerly known as wood naphtha, wood alcohol or methyl alcohol.

*The People of the State of New York, represented in Senate and Assembly, do enact as follows:*

Section 1. The penal law is hereby amended by inserting therein at the end of article forty, three new sections, to be sections four hundred and forty-six, four hundred and forty-seven and four hundred and forty-seven-a, to read as follows:

§ 446. On and after September first nineteen hundred and twenty-four, the liquid known as wood naphtha otherwise known as wood alcohol, or methyl alcohol, either crude or refined, whatever may be the name or trade mark under or by which the said liquid may be called or known, shall hereafter be designated and known as methanol, and the use of the terms wood naphtha, wood alcohol methyl alcohol, or any other term or designation of the liquid, except methanol, is forbidden and shall be discontinued.

§ 447 Any person who shall sell, offer for sale, give away, deal in or supply or have in his or her possession with intent to sell, offer for sale deal in or supply, any article of food or drink or any medicinal or toilet preparation intended for human use internally, which contains methanol, either crude or refined, whatever may be the name or trade mark under or by which methanol was formerly called or known, is guilty of a felony

§ 447-a No person shall sell offer for sale give away deal in or supply, or have in his or her possession with intent to sell offer for sale give away deal in or supply any methanol either crude or refined whatever may have been the name or trade mark under or by which methanol was heretofore called or known unless the container in which the same is sold, offered for sale, given away, dealt in, or supplied shall have imprinted upon said container or upon a label pasted upon the container, the following device and words, in bold characters in red colors, viz

(Skull and cross bones represented)

#### POISON

WARNING—It is unlawful to use this fluid in any article of food, beverage or medicinal or toilet preparation, intended for internal human use

Any violation of the provisions of this section shall be a felony

§ 2 This act shall take effect September first nineteen hundred and twenty-four

Senate Bill Int No 389, Print No S 394 by Senator Michael E Reiburn, would amend section 203, Public Health Law, by making penalty for unauthorized practice of dentistry a felony Referred to Public Health Committee

No comment

Senate Bill Int No 425, Print No S 434 by Senator Charles Hewitt of Locke, N Y, concurrent Assembly Bill Int No 642 Print No A 651, by Assemblyman G S Johnson of Wayne County, would add new section 438-a Penal Law, making it a misdemeanor to peddle from house to house raw or unpasteurized milk other than such milk from tuberculin tested cattle. Referred to Codes Committee in both Houses

No comment

Senate Bill Int No 430 Print No S 439, by Senator Wm Love of Brooklyn N Y concurrent Assembly Bill Int No 565 Print No A 568 by Assemblyman Frank H Lattin of Orleans County, which has been referred to the Public Health Committee in both Houses is printed here in full for the information of the profession

# State Department of Health

## PUBLIC HEALTH COUNCIL HOLDS ONE HUNDREDTH MEETING

On January 10, 1924, the Public Health Council held its one hundredth meeting. The Council met for the first time September 30, 1913. Three of its original members are still active. Dr. Simon Fleener, who succeeded the late Dr. Biggs as Chairman, Mr. Homer Folks, and Professor Henry N. Ogden. Dr. T. Mitchell Prudden may also be included as one of the original members, as he was appointed in March, 1924, to take the place of Dr. Biggs, who became an ex-officio member by virtue of his appointment as Commissioner of Health.

## PATENT MEDICINE AD REFUSED BY NEWSPAPER

Recently Deputy Commissioner Brooks received an inquiry from a newspaper in Utica in regard to a patent medicine known as "Mark H. Jackson's Rheumatism Cure," the proprietors of which wished to secure advertising space in the paper. Quoting from a letter from the Propaganda Department of the A. M. A., Dr. Brooks in no uncertain terms furnished the desired information. The ad was refused.

## CONGENITAL SYPHILIS TREATED AT CLINICS

During December, 1923, there were 264 children suffering from congenital syphilis treated at the clinics supervised by the Venereal Disease Division of the State Department of Health. For the entire year there was an average attendance at these clinics of 240 children, the Department supplying the drugs necessary for their treatment.

## ORTHOPEDIC CLINICS

Orthopedic clinics were recently held by the Department in Walton, Monticello, White Plains, Mineola and Huntington. Not only were cases of poliomyelitis advised, but many children were brought to these clinics by reason of postural defects.

## ACQUIRED SYPHILIS IN AN INFANT

Recently there came to the attention of the Division of Venereal Disease a case of acquired syphilis in an infant eight months of age. The child was suffering with chancre of the tongue. Typical treponemata were found in a specimen from the lesion.

## SMALLPOX CASE DISCOVERED THROUGH DEMAND FOR VACCINE VIRUS

Drug stores in three adjacent towns recently had such a demand for vaccine virus that an investigation was made as to the cause. It was discovered that there was an isolated mild case of smallpox in the vicinity, the presence of which was known among the neighbors, all of whom immediately desired to be vaccinated.

## MATERNAL, PRENATAL AND CHILD CONSULTATIONS IN 1923

At rural health consultations conducted by the Department in 1923, 4,183 children were examined in 158 communities in 28 counties. Six hundred and twenty-six prenatal examinations were made in nineteen communities.

## TOXIN-ANTITOXIN ADMINISTERED DURING AN EPIDEMIC

Dr. Frank W. Laidlaw, district state health officer, reports the results of giving toxin-antitoxin to all children in East Kingston at the progress of an epidemic of diphtheria. It occurred this winter. It requires from weeks to several months for complete immunization following the use of toxin-antitoxin, but in these cases children who had received this treatment and subsequently developed diphtheria a few weeks later, before immunization was completed, the disease followed by an extremely mild course. Dr. Laidlaw reports this in several instances in which it was possible to contrast the results with those of children who had not been immunized.

## BAD RESULTS FROM VACCINATION ON LEG

During the recent outbreak of smallpox in the city of Albany practically all employees of the State Health Department were vaccinated. At their request a few of the women vaccinated upon the leg, the results emphasized the inadvisability of such procedure. Out of thirty-seven who had never been previously vaccinated, three so vaccinated were incapacitated to such an extent that they lost more time than the other thirty-four who were vaccinated upon the arm. One of these was crippled for seven days, one for eleven days, and one for fourteen days.

## NEWS NOTES

### LEGISLATION ON STATE AID FOR COUNTIES

We are glad to print the following letter from Dr. Paul B. Brooks, Deputy State Commissioner of Health

Albany, N. Y., February 9, 1924

My Dear Mr. Editor

A bill amending sections of the public health law relating to State aid for county health work introduced in the Senate by Dr. Love and in the Assembly by Dr. Lattin, was briefly reviewed on pages 81 and 82 of the NEW YORK STATE JOURNAL OF MEDICINE, of February 1st. To avoid possible misunderstandings as to the scope and purpose of the legislation, the State Health Department presents the facts which follow

The present law constituted Chapter 662 Laws of 1923, and was designed to provide financial aid in connection with new and essential health work to counties in which such undertakings without aid would be difficult. It provides that the legislature shall appropriate a sum necessary to make grants of 50 per cent of the amounts appropriated and expended for health work by counties when the applications for such aid have been approved by the State Commissioner of Health

Several applications have been received and are now pending. These call for aid in connection with a variety of undertakings, a majority covering employment of nurses in rural counties. There must of necessity be someone authorized to determine what projects especially merit State aid. By inference the Commissioner of Health now has this authority. The proposed amendment establishes the fact definitely.

The law and amendment are designed to encourage and promote, and not to limit, health work in rural counties. The only restrictions imposed on expenditure of funds granted as State aid is that they shall be expended only for the purposes for which the aid is granted and that any balances not so expended shall be returned to the State treasury. The present law apparently permits the granting of aid only in connection with amounts appropriated and expended during the preceding year. The amendment permits the granting of aid covering appropriations either for the preceding or the current year but provides that no single grant shall be for both.

Yours sincerely,

PAUL B. BROOKS.

for dir

### THE HEALTH OF GERMAN CHILDREN

Lecture on the Health of German Children given by Dr. Haven Emerson on February 1st in the auditorium of the Metropolitan Life Insurance Company. Dr. Emerson was sent to Germany by the Society of Friends, which is interested in relief work among the German children. He sailed on December 13, 1923, and has been two weeks visiting Breslau, Dresden, Berlin, Frankfurt, Cologne, and Coblenz. He was accompanied by Dr. Charles Bolduan, who is with the United States Public Health Service stationed in Bremen.

The doctors obtained their information at first hand from physicians, public health nurses, school teachers, and social workers, and also from the official vital statistics records. Their work was done mostly in the cities, but they were assured that the same conditions prevailed in rural districts.

Undernutrition was common. The usual condition was that nearly all the children were underheight and underweight to the extent of two years' growth.

Diseases of undernutrition were extremely prevalent. About 40 per cent of the children under two years of age who were in the hospitals were there for scurvy. Rickets in its extreme manifestations was also common, and cases were given the treatment with light. Pellagra, keratomalacia, and hunger oedema were also seen. These conditions of undernutrition were common during the war, and at its close there was a great improvement for two or three years, but during the past two years conditions have been worse than ever.

Skin diseases were also common, especially impetigo, scabies, and lousiness. These were largely the result of a lack of public bathing.

facilities, and this in turn was due to industrial depression. The people had always depended on public baths for bathing, and when they were closed from lack of funds the people seemed helpless. Lack of a change of clothing and the unheated condition of the living rooms of the dwellings also helped the spread of skin diseases.

Tuberculosis is the great scourge of German children, as well as of grown folks. The cause of its spread was twofold: first, the under-nourishment and lowered resistance of the children, and second, the crowded state of the rooms owing to lack of fuel. Advanced tuberculosis of the lungs was often seen in six-months-old children, and was common in those two or three years old.

The people were unable to buy milk. While the pre-war daily supply of milk to Berlin was 1,200,000 liters, now it is only 150,000 liters. The highest price was only 12 cents a liter, but the people could not afford to buy the milk.

From 10 to 40 per cent of the workers are idle, and are supported by public doles. The

German system has been to pay workers when they were idle, and to provide old age pensions. The people have always depended on the government for support during sickness, idleness, and old age, and they seem to have no initiative to help themselves now. Moreover, the industrial leaders have fortified themselves against taxes on their own incomes, and public finances are hard to obtain. Dr. Emerson said that it had taken Americans over one hundred years to decide to tax incomes, and that Germany, with its present extremely weak Government, could not get money out of the powerful industrial leaders.

Dr. Emerson said that conditions like those in Germany could be duplicated in the United States in isolated instances, but nowhere in this country was there widespread suffering such as exists among children all over Germany. He made the humanitarian plea that American standards of conduct require the relief of suffering human beings regardless of their previous attitude, and that in any event the German children were innocent of wrongdoing.

## NUTRITION CONFERENCE

Through the courtesy of an unnamed host a group of thirty-one representatives of various organizations in Brooklyn, carrying on nutrition work, held a round-table conference at luncheon at the Chamber of Commerce, on February 5th. Dr. Louis C. Ager, Chairman of the Milk and Camp Auxiliary of the Brooklyn Tuberculosis Committee, presided. Among those who took part in the discussion were Dr. Herman T. Peck, Borough Chief for the City Health Department, Dr. Laura Riegelman, Borough Chief of the Bureau of Child Hygiene, Dr. Charles A. Gordon,

President of the Medical Society of the County of Kings, Dr. Adela Smith, Superintendent of the Special class of the Board of Education and Dr. Charles S. Prest, Secretary of the Brooklyn Tuberculosis Committee. The luncheon is a part of a general public health movement in Kings and Queens County, in which the physicians are taking a leading part. While the voluntary health organizations are extremely active in the two Boroughs, the physicians also are active and their organizations are co-operating closely with the lay organizations.

## THE ARNOT-OGDEN MEMORIAL HOSPITAL, ELMIRA

Ten nurses from the Training School took the State Board examinations in Buffalo early in February.

On February 1, "Moving Up Day" was celebrated by the members of the October, 1923, class in the Training School constructed by the Hos-

pital. The president of the Senior Class presented to them their caps, and they with their parents and friends were received at an informal tea. Music and addresses by Superintendent Emily McCreight and Mrs. Caroline Prutsman, head of the Training School, completed the programme.

# THE DAILY PRESS

Did you ever keep track of the medical news that is printed by the daily papers? If you have not, take notice of those health items. You probably have the impression that the medical items in the daily press are fantastic versions of popular science, but you will find that they score ninety per cent for truthfulness, practicality and human interest. The daily press is a valuable vehicle for spreading medical news—(The Editor)

The Albany papers are giving publicity to the popular demand for vaccination in the city. Dr. Wiltsie the City Health Officer reports that 13,000 persons have been vaccinated in Albany during the last few weeks as the result of an outbreak of mild smallpox. Three cases of smallpox are now under observation in Albany, and they are sufficient to send the people by the hundreds to the vaccination stations.

The New-York and Brooklyn papers make brief references to the illness of about thirty children in a school in a suburb of Boston. The illness was ascribed to the administration of toxin-antitoxin that had been frozen. Dr. W. H. Park is quoted as saying that the accident was not anticipated and that steps will be taken to prevent its recurrence. Dr. Bela Schick, the originator of the test which bears his name, accompanied Dr. Park in the investigation of the case.

The New York *Tribune* has an account of the sentence of a New York physician to jail for issuing a certificate that a woman's death was due to nephritis and lung infection while an autopsy showed that death was the result of an illegal operation. The sentence was evidently for falsifying a death certificate, and not for the performance of the operation. Convictions like this are evidences of the intention of physicians to maintain a high standard of professional ethics.

Rochester has long been noted for its efficient public health work. The city papers make frequent mention of the Child Welfare consultations which are being conducted in Monroe County under the auspices of the Tuberculosis and Public Health Association of Rochester and Monroe County and the State Department of Health. While the consultations reach a considerable number of children directly a greater effect is that the parents are urged to take their children to their family physicians, both for treatment of

the defects and for regular examinations in order to detect future defects. The consultations, or clinics, are feeders of cases to private physicians.

The radio health talks which are broadcasted every Friday evening by the State Department of Health from Schenectady are among the first of their kind to be instituted. The *Times* of Washington, D. C., contains an interview with Dr. John M. Dodson, Secretary of the Bureau of American Medical Association, in which the doctor comments on the program of the meeting of the Council on Medical Education and Hospitals to be held on March 5-7 in Chicago. The program will give a prominent place to a discussion of radio health talks. Dr. Dodson says they have a great use in educating the public, and in warning and guarding it in relation to health and hygiene.

The subject of iodine in the city water continues to call forth fantastic comments from the Rochester papers which quote a chemist as saying that insanity, except its hereditary form, is caused through underdeveloped thyroid glands, and the iodine will remedy that. The speaker was alleged to have said that increased mental capacity will enable the pupils to advance two or three times as rapidly as at present. This item is an example of how *not* to give publicity to medical subjects. The author evidently intended the speech to be humorous, but the reporters reported it as serious.

A survey of the hospital facilities of Nassau County, which has just been made by the County Medical Society, is receiving comments in the local newspapers. The *Lynbrook Press* has an effective editorial comment on the report, and says "Nassau County is the wealthiest county of its kind in the State. Public health is purchasable. Will Nassau County pay the price? Nassau County should be able to care for 748 sick persons at a time, aside from those suffering from tuberculosis. At the present time it can care for only 120. What is happening to the other 628?"

"An Indian chief who roamed this section in 1624 had no chance to get his sick wife into a hospital in Nassau County. The chief citizen in Nassau County in 1924 has less than one chance in six.

"We bury our dead wage earners in Nassau County and then care for their dependent families. Why not cure our sick wage earners and let them care for their own families?"

We are glad to print the quotation as an example of a proper and effective medical publicity

The question of health teaching and nursing service in parochial schools is answered in the *Albany Journal* by a description of the health work in the Albany parochial schools. The health work done in those schools consists in classroom instruction, morning inspection as to the performance of health chores, the designing of health posters, and the management of school clinics for children with defects

The *Cortland Standard* has a three-column report of the Annual Meeting of the Cortland County Tuberculosis Committee. The receipts from the sale of Christmas Seal Stamps were about \$2,000, most of which was used in maintaining a children's summer camp. The Committee also had a booth at the County Fair at which a Health Gypsy told health fortunes to the children

The County Tuberculosis Nurse reported on her activities at the fifteen clinics and the supervision of tuberculosis cases in their homes. Assistance given to rural schools, to attendance at children's consultations, clinics conducted by the State Department of Health, to the organization of a mothers' club in Homer, and to providing for health talks and exhibits. The report gives one a favorable impression of the work of the County Committee

The Middletown papers tell of the retirement of Dr. J. L. Hanmer as health officer and his appointment as a member of the Board of Health. Dr. Hanmer has been a picturesque health officer. Tall and angular, with a flowing white beard, he was a conspicuous figure. He also was different from most of his fellow-citizens in his speech. Outspoken and honest, he yielded to no one, and differed with many, but the peculiar thing was that time usually justified his attitude. For example, Dr. Hanmer opposed the pasteurization of milk when most authorities were in favor of it. An ordinance was passed that all milk sold in Middletown should be pasteurized, but after an experience of a year or two, the ordinance was rescinded because the pasteurizing plants were not properly conducted. Dr. Hanmer felt that small pasteurizing plants, run by amateurs, did more harm than good, and the outcome justified his attitude

Measles seems to be prevalent in several sections of New York State. The *Patchogue* papers carry a warning from the school authorities calling attention to the laxity of parents in controlling their children who are excluded from school, and even taking them to the movies and Sunday School

The people in Oswego County show the usual ignorance about the beginning signs of measles, for Dr. C. R. Hervey, District State Health Officer, has an article in the *Oswego papers* on the early signs of measles. He said that a family of five children visited another family in which the children were not sick in bed, but had the beginning signs of red eyes, running noses, and coughs. In due time all five of the visiting children and their mother came down with measles. This is commonplace to doctors, but it is news to most laymen that measles exists, and can be given, four or five days before the skin eruption appears

It would seem that doctors have had years of time to educate the public regarding the early signs of measles, and that the parents who have had the disease and have heard about it since their childhood ought to know how it begins

The *New York Times* of February 3rd contains a warning against a disease called tularemia, which is spread by infected rabbits. The germs of the diseases are found in the livers of the animals on sale in the markets, and sometimes infect the hands of butchers who dress the animals. The disease is prevalent among Western rabbits

The Rochester papers print accounts of deafness caused by foreign bodies in the ears of school children. These reports were inspired by the managers of a Deafness Prevention Clinic that was organized in one of the public schools. They mention one case of deafness that had been treated by a licensed physician for some months with internal medicine, without result, and the clinic restored the hearing by removing impacted wax. In these days when the sins of omission of physicians are magnified, it would have been better to have omitted mention of the physician, but the account is consistent, for it berates a chiropractor as follows: "A year ago we saw a girl with wax impacted in both ears. She was very hard of hearing and very much back in her school work. Her parents refused to allow us to remove the debris from her ears, but instead, took her to a chiropractor, who insists that he can cure this girl's deafness by punching her spine. She is still deaf."

The Ogdensburg papers report a health survey that has been made of the city by a representative of the State Department of Health. The report contains recommendations for improving the public health service of the city. The report carries a strong recommendation to establish a nursing service that shall include prenatal maternity, and infant welfare work in order to reduce the death rate among the new-born children

# BOOK REVIEWS

**TONSILLECTOMY, BY MEANS OF THE ALVEOLAR EMINENCE OF THE MANDIBLE AND A GUILLOTINE.** With a Review of the Collateral Issues, by GREENFIELD SLUDER MD., Clinical Professor Director Department of Rhinology, Laryngology and Otology, Washington University School of Medicine. 90 illustrations C. V. Mosby Co., St. Louis, 1923 Price \$5.00

In this volume the author has not written a book on Tonsillectomy, as the title on the outside would imply but one according to the full title found on the fly leaf on "Tonsillectomy by Means of the Alveolar Eminence of the Mandible and a Guillotine." In the chapter, "Tonsillectomy Technique," which is only a small but the most important, part of the volume, he makes it clear that the "Sluder Technique" is not the removal of the tonsil by means only of a guillotine an impression that has been the cause of failure and condemnation of the method on the part of some operators but is the removal of the tonsil by means of the alveolar eminence of the mandible and a guillotine. The Sluder guillotine is minutely described and measurements given. There are illustrations of this instrument and various modifications but there are also illustrations of the alveolar eminence as found at various ages and thus no less important factor in the performance of the operation is as minutely described as the guillotine. The plates are almost all original but the ones in this chapter are drawn from life, and are unusually good. These with the text make each step of the operation perfectly clear and easy to follow. The anatomy and blood supply are given, but not exhaustively. The indications and contra indications, results, and anesthetic are discussed.

The chapter, Physiology and General Pathology of the Tonsil is written by Arthur W. Procter, M.D. and is a valuable addition to the work. The illustrations of this part of the work are good and are a great aid in making the text clear.

J. D. Kelly Jr., M.D. wrote the last chapter "Adequacy of Direct Vision," and in it he describes the direct vision adecotome and its methods of use.

The bibliography seems to be complete and will be a help to those who want to know more of the subject. The type, binding and appearance of the book leave nothing to be desired. It is a work that can be highly recommended and should certainly be read by everyone who is doing tonsillectomy.

JOHN W. DURKIN.

**A TEXT BOOK OF PHYSICS AND CHEMISTRY FOR NURSES** By A. R. Bliss Jr., Ph.G., Ph.Ch. A.M. Plum D., M.D., Lecturer Chemistry and Materia Medica, Grady Training School for Nurses Atlanta. A. A. Olive, A.B., A.M., Ph.Ch. Ph.M.D., Lecturer on Chemistry, Hillman Hospital Training School for Nurses Birmingham. 70 illustrations, Third Edition thoroughly revised and rewritten. J. B. Lippincott Co., Phila. and London 1923

This is one of the series of Lippincott's Nursing Manuals and according to the statement of the authors is intended to cover a course of twenty lessons in chemistry and five lessons in physics.

About 60 pages are devoted to physics both didactic and laboratory experiments, and one hundred and twenty pages are devoted to chemistry. The appendix contains brief directions for Urinalysis and the Removal of Stains Weights and Measures, Glossary, etc.

The book is planned after the Standard Curriculum

for Schools of Nursing, prepared by the National League of Nursing Education.

The authors seem to have done their part well in preparing the text and in the selection of the experiments.

E. H. BARTLEY

**NURSING AND NURSING EDUCATION IN THE UNITED STATES** Report of the Committee for the Study of Nursing Education. Dr. C. E. A. WINSLOW Chairman. The Macmillan Company New York, 1923

Physicians connected with nurses' training schools will profit by a perusal of the 585 pages containing a report in detail of a survey of 23 schools of all types, made by the Rockefeller Foundation and conducted under the Supervision of Representative Medical and Nursing Educators.

The function of the nurse as a professional person is considered in the first part with relation to the three major fields of public health, private duty and institutional work. The second part is devoted to a consideration of the training she receives and a description of that which it is said she should receive.

The committee arrives at very definite conclusions of which those for a nursing service subsidiary to that of the trained nurse, the relief of the nurse in training from the traditional non-nursing labor, the provision of university training schools, the setting up of the educational work as a hospital entity separate from the administration hospital problem of providing nursing care (by utilizing pupils), will be of particular interest to physicians.

To some (both nurses and physicians) an entirely new point of view is presented as expressed in the final conclusions of Miss Josephine Goldmark, Secretary of the Committee, when she says, "From our field study of the nurse in public health nursing in private duty, and as instructor and supervisor in hospitals it is clear that there is need of a basic undergraduate training for all nurses alike which should lead to a nursing diploma. Postgraduate training in any one of the three nursing specialties should be given after completion of the basic undergraduate course and should lead to a further diploma or degree. It is moreover, clear that training is needed also for a subsidiary nursing group who shall be equipped to care for cases of non-acute illness and disability for chronic and convalescent cases in which the services of a graduate nurse are not necessary."

A. N. T.

**AIDS TO GYNECOLOGY** By RICHARD E. TOTTENHAM B.A., M.D., B.Ch., D.P.H. (University of Dublin) F.R.C.P. Sixth Edition. William Wood & Company, New York, 1923

This small book affords a ready means of obtaining a quick review on most of the Gynecological problems. It is not in any sense a text book, as detail is entirely lacking every phase of the subject being generalized.

The reviewer feels that even in such a small book that more attention should have been paid to the use of Radium and X ray as it is in the student days that the impression must be made, that there are other ways than surgery of definitely curing some of these Gynecological conditions.

**EXCURSIONS INTO SURGICAL SUBJECTS** By JOHN B. DEANER, M.D., Sc.D., LL.D., F.A.C.S., and STANLEY P. REIMANN, M.D. Octavo volume of 188 pages with 30 illustrations. Phila. and London, W. B. Saunders Co., 1923. Cloth, \$4.50.

This collection of essays includes five addresses made

### Details of the Death of Mr Jones

Alas, poor Jones has pushed the clouds,  
And loosed this mortal coil,  
Despite the doctors' aid,  
He's underneath the soil

First Dr *Payne* was called upon  
The case to diagnose.  
He called in council Dr *Tombs*  
Who gave a powerful dose

The family, though quite satisfied  
That all was being done  
Asked Dr *Killum* to consult  
"Two heads" they said, "beat one"

Poor Jones continued to decline  
They dosed him long and often  
"A fighting chance he has," said they  
And sent for Dr *Coffin*

Now Dr *Coffin* was expert  
In things from A to Izzard  
He found the seat of Jones' disease  
Was centered in the gizzard

He said an infiltrated mass  
Was pressing Jones for breath,  
And he would like opinions from  
His old friend Dr *Death* (Todt, German for death)

When Dr *Death* had seen the case  
He talked of operation,  
And mentioned Dr *Carver's* name  
In terms of approbation

Then Dr *Carver* took the case  
And sent for his assistant,  
A Dr *Blood*, whose name and fame  
Were equal and consistent

They carefully dissected Jones  
And broke up all adhesions  
I think they took the gizzard out,  
And sewed up all his lesions

They said that if he rallied  
From the necessary shock  
His future health would surely be  
As solid as a rock.

They saw no reason why a man  
As strong as Jones had been  
Could not do about as well  
With gizzard out as in

Of course just now the shock was bad,  
But in their estimation  
He would pull through in course of time,  
If spared an inflammation

But poor Jones did not rally much  
Though both resigned and brave.  
A prayer they had before he died  
From Rev Dr *Grave*

Alas! Poor Jones, cut off too soon,  
When life was at its flood  
The undertaker's name I think  
Was Mr James K. *Mudd*

Of course it only happened that  
These men were all so named  
But people joked about it some,  
And said, "Well, I'll be blamed!"

And 'lowed Jones surely had poor luck,  
When all was said and done,  
And thought he could have swifter gone  
By getting Dr *Gutin*

One knew a Dr *Hammer*  
That they said was pretty sure,  
And Dr *Skinner*, too, was known  
To either kill or cure.

Another Doctor, too, they knew  
*Box* was his name they said  
I don't suppose Jones thought of these  
Till after he was dead

And so the folks went a ramblin' on  
One'd heard of Dr *Bones*,  
But I got tired and came away—  
I always liked poor Jones

A colored gentleman named Joshua Johnson was arrested for making whiskey. When his case was called, the judge jolingly asked him if he was any relation to the Joshua that made the sun stand still.

"No, sah," replied Joshua, "I'se no 'lation to dat guy, but I'se the real and 'riginal Joshua that made de moonshine."

### Financially Speaking

"What makes you think that the man we just met was a banker?"

"Why, I heard him say that children are the coupons cut from the bonds of matrimony."

—*Wall Street Journal*

### Ready to Help

Mrs Neurotique—"Doctor, don't you think I have traumatic neurosis?"

Doctor—"Not yet, but I'll write you out a list of the symptoms and you can go home and start working on them"—*Life*

### Getting at the Cause

"My dear fellow," said the doctor, gravely, "your rheumatism, as you call it, but which is really osteoarthritis, is caused by defective teeth, science has proved that fact. Now, let me see your teeth."

"All right, doc," murmured his patient, wearily, "hold out your hand"—*Dry Goods Economist*

"Is Doc Bartlett a well-informed man?"

"Is he! Say, you just ort hear doc give the Gov'tment hell"

## FURTHER OBSERVATIONS ON 'NEW METHODS OF PREVENTING POST-OPERATIVE INTRA-OCULAR INFECTIONS'\*

Report of 1,250 Successful Cases

GEORGE HUSTON BELL, M.D., F.A.C.S

NEW YORK CITY

IN presenting to the medical profession my second paper on the prevention of "Post-Operative Intra Ocular Infections," it is a matter of profound gratification to be able to state that in the 1,250 cases herewith presented there has not been a single primary infection or a case of panophthalmitis. This, I think, is a great tribute to the method employed.

In my first paper before the American Medical Association in 1921, my technique was outlined and has not since been changed. The time has come when we can now approach the operating table with a feeling and a confidence, such as we have not had in the past, and I feel that a great load has been lifted from the shoulders of most Ophthalmic Surgeons.

How often have you witnessed an infection following intra-ocular operations? Unfortunately, this calamity has overtaken us all. How often have you been told by the bacteriologist that the smear from the conjunctival sac was dirty and how often have you waited for days for the smear to become negative before operating? You then operate and dress the eye with fear and trembling, forty-eight hours afterward. Again, we have been told by the bacteriologist that the smear was negative, we operate and in forty-eight hours, we dress the eye and find an infection—this, I believe, has happened to us all.

In no case of our 1,250 did we wait for a single day before operating to clean up whatever was found in the smear from the conjunctival cul-de-sac.

Much valuable time is lost by trying to clean up the conjunctiva when there is a questionable smear. The time that is lost is due to inadequacy of hospital facilities and also to patients. According to my method we do away with all this "lost motion." If a patient's eye looks clinically

clean we go ahead and operate regardless of the findings in the smear. The so-called "Senile cataracts" are not looked upon as clinically unclean by us. But we do exert pressure over the lacrimal sac in such a way as to cause the smallest quantity of fluid present in the sac, to flow back through the canaliculi. Cases of mild infection limited to the sac will thus be detected and must be cleared up before we regard the eye as clinically clean. In other words, we pay no attention to the findings of the bacteriologist.

I have such strong faith in my method of treatment that I am anxious for all ophthalmic surgeons to give it a trial, unless they have some better plan of procedure.

### TECHNIQUE

First step. The focal infections, such as oral sepsis, diseased tonsils, and toxemias of the intestinal tract, must be removed. I hold that it is just as necessary for the ophthalmic surgeon to get his house in order before subjecting his patient to a major operation upon the eye, as it is for the general surgeon to clean house. Every patient of mine, whether clinical or private, must stand the acid test for the "Three T's" (teeth, tonsils and toxemia), before we even consider the operation. This routine is carried on in my clinics at the New York Eye and Ear Infirmary, and the New York Polyclinic Hospital, and also in my private practice. I said in Atlantic City at the A.M.A. session in 1919, that "a dirty mouth was one of the greatest menaces to the human race." I wish now to reaffirm and confirm that statement. We must make no mistake about oral sepsis, as it is the arch enemy of the ophthalmic surgeon. The germs themselves and toxins or their poisonous products must be eliminated from the system as far as lies in our power, if we are to better our cataract results. In this way we can hope to reduce the amount of secondary

\*Read at the Annual Meeting of the Medical Society of the State of New York, at New York City May 23, 1923.

post-operative infections. If we clean the blood by getting rid of toxemia, then we will raise the resistance of our patients, so that we may be able to approach the operation with a confidence and courage such as we have not had in the past. We must bear in mind that the longer toxemia exists the less nerve energy and resistance there is.

All of this work on focal infections must be done from two to three months before the patient is admitted to the hospital. I lay great stress on this work, as we must study the general state of patients more than we have done in the past. A Wassermann test is made in zonular and complicated cataracts, also in hard cataracts, when necessary.

The urine is examined several times previous

to the operation, and the height of Blood Pressure must be known.

Second step. The patient is then admitted to the hospital. Twenty-four hours before the operation, a dose of castor oil is given, as nothing sweeps and cleans the intestinal tract like castor oil. Castor oil has been the standby of physicians since time immemorial. I know of no substitute for it.

Third step. Two hours before the operation, a smear of the conjunctival sac is taken, after which two drops of a one per cent solution (five grains to an ounce of distilled water) of silver nitrate are instilled into each eye.

The silver produces an irritation, but not an inflammation, so that when the patient comes to the operating table the eyes look red and in-

### Operations Performed in 1250 Cases of Intra-Ocular Disease

CASE	DIAGNOSIS	SMEAR	OPERATION
10	Chronic Glaucoma	Pus, Mucus, large diplococci . .	Lagrange
145	Immature and mature senile cataracts	Negative	Prelim Iridectomy
50	Mature senile cataracts	Epithelium, K.L.B	Prelim Iridectomy
50	Mature senile cataracts	Leucocytes, large and small diplococci	Prelim Iridectomy
75	Mature senile cataracts	Pus, leucocytes and mucus	Prelim Iridectomy
65	Glaucoma	Negative	Iridectomy
25	Acute Glaucoma .	Pus, pneumococci, mucous	Iridectomy
25	Old Iritis	Mucus, leucocytes, no bacteria	Iridectomy
20	Occluded pupil	Negative	Iridectomy
20	Anterior synechiae	Negative	Iridectomy
30	Chronic Glaucoma	Negative	Lagrange
10	High myopia .	Negative	Linear extraction
10	High myopia	Negative	Discission
20	Chronic Glaucoma	Pus cells, mucus	Trephine
15	Capsular cataracts	Occasional diplococci	De Wecker's
15	Secondary cataracts	Pus cells, mucus, bacteria	De Wecker's
10	Postpolar cataracts	Mixed germs, diplococci	Discission
20	Zonular cataracts	Negative	Discission
10	Zonular cataracts	Pus cells mucus, bacteria	Discission
30	Secondary cataracts	Negative	Discission
30	Secondary cataracts	Mucus, leucocytes	Discission
5	Buphthalmia	Leucocytes, large diplococci	Iridectomy
20	Traumatic cataracts	Negative	Linear extraction
10	Traumatic cataracts	Leucocytes, cocci	Linear extraction
20	Traumatic cataracts	Small, large diplococci	Linear extraction
10	Zonular cataracts	Negative	Linear extraction
20	Congenital cataracts	Negative	Linear extraction
5	Morgagnian cataracts	Mucus, pus, diplococci	Extraction
120	Mature senile cataracts	Negative	Extraction
25	Mature senile cataracts	Pus, cells, no bacteria	Extraction
25	Mature senile cataracts	Leucocytes, occasional coccus	Extraction
10	Mature senile cataracts	Mucus bacteria, leucocytes	Extraction
30	Mature senile cataracts	Epithelium, pseudo—"K.L.B."	Extraction
20	Mature senile cataracts	Much mucus, no bacteria	Extraction
20	Mature senile cataracts	Mucus, diplococci, pus cells	Extraction
40	Mature senile cataracts	Leucocytes, no bacteria	Extraction
40	Mature senile cataracts	Mucus, staphylococci	Extraction
10	Mature senile cataracts	Pus, pneumococci, mucus	Extraction
5	Mature senile cataracts	Mucus, leucocytes, no bacteria	Extraction
10	Mature senile cataracts	Mucus, few cocci, no pus	Extraction
20	Mature senile cataracts	Leucocytes, large and small diplococci	Extraction
20	Mature senile cataracts	Pus, mucus, leucocytes	Extraction
20	Mature senile cataracts	Mucus, large and small diplococci	Extraction
20	Dislocated lens	Mucus leucocytes, bacteria	Extraction
30	Complicated cataracts	Pus cells, mucus, bacteria	Extraction
4	Cyst of Iris	Negative	Iridectomy
6	Detachment of retina	Negative	Trephine

filmed, with a certain amount of mucus at the inner corners. The eyes are then washed out with a normal salt solution, as a means of freeing the operating field of mucus, dust, etc. After the patient is well under the local anesthetic, the operation is performed. We always try to get a conjunctival flap. Our usual technique is then employed. Afterward we use 2 drops of 3 per cent solution of atropin, and a 25 per cent solution of argyrol, after which both eyes are bandaged for forty eight hours. Then every two days, the eye is dressed and argyrol and atropin instilled.

#### SUMMARY

If we are to improve our cataract results and have fewer post operative infections, we must start at the bottom and not at the top. It is just as necessary for the Ophthalmic Surgeon to clean house, as it is for the general surgeon.

1 The arch enemy of the Ophthalmic Surgeon is oral sepsis. Patients must stand the acid test for focal infections, the "Three T's" (teeth, tonsils and toxemia), before we will consider the operation. This applies to all patients except emergency cases. Wells, before the New England Dental Society called attention, in no uncertain way, to the importance of going after oral and focal infections before attempting operations where the eye-ball is opened.

2 I wish to express strong faith in silver nitrate as a germicide and irritant. In all of these 1,250 cases, one per cent silver nitrate was instilled into the eye two hours before the operation, and 25 per cent solution of argyrol was used at the time of operation.

3 If a patient's eye looks clinically clean we operate. The so-called "Senile cataracts" are not looked upon as clinically unclean by us. We pay no attention to the findings of the bacteriologist. In fact, in private patients, I no longer take smears.

4 Analyzing our 1,250 cases, we have three secondary infections, coming on nine days after the operation. One of these patients recovered and will have some vision, the other two developed chronic iridocyclitis. These patients had negative smears. We were able to trace these infections to faulty technique in reference to oral sepsis.

5 Case one and two occurred in the same patient. His smear showed pus and diplococci, mucus, also he had chronic dacryocystitis. The patient had chronic glaucoma with very little vision. I performed a Lagrange operation without bringing the tension down, in two weeks, another Lagrange operation was performed. No infection followed either of these operations. Doctor Stout was house surgeon at that time and assisted.

6 Vitreous humor was lost in four cataract cases. In case 55 a bead of vitreous humor

appeared. The smear contained pus and a number of diplococci. No infection resulted. Case 167 was a bad case of ozena, a smear showed pus cells and staphylococci. There was no infection. An iridectomy was performed in Case 280, after which a secondary membrane was removed. Some vitreous was lost. A smear showed considerable mucus and a few leucocytes and an occasional diplococci. There was no infection. In Case 391, an iridectomy and capsulectomy were performed. Vitreous was lost, the smear showed pus, diplococci and mucus and no infection resulted. Case 518 presented a dislocated lens. Iridectomy and extraction of the lens were performed, considerable vitreous was lost in this case, the smear showed a few leucocytes and some bacteria—no infection resulted. In case 799, there was ozena. A smear showed leucocytes and large diplococci. No infection resulted. In case 897, the patient squeezed and lost considerable vitreous. The smear showed epithelium and pseudo K. L. B. No infection resulted.

7 Case No 1150 Mr H., age 68, with mature senile cataract was referred to me by Doctor Emil Mayer. This patient had been troubled for years with an obstruction of the nasal duct. Probes had been passed into the duct from time to time. The canaliculi were still open, but no pus could be squeezed out of the sac. He had angina pectoris and would not submit to extirpation of sac. Doctor Mayer and I decided to undertake the extraction of the cataract with an extra dose of silver. One per cent nitrate solution was used in his eye at 9 A. M. and again at 12 o'clock. At 2 P. M. the operation was performed, the patient sitting up in a chair on account of his heart. His eye was dressed every 24 hours on account of his lacrimal trouble. He got a beautiful eye with 20/30 vision. The smear in his case before the silver was instilled, showed pus cells, diplococci and mucus—but for its "watery" condition the eye looked clinically clean. Doctor David Robb was House Surgeon on my division at "The Infirmary" and assisted me in this operation.

Case 1,200 was a similar case in a woman, age 60, with lacrimal trouble of long duration. Her smear was negative and her eye looked clinically clean. I operated upon her as I did on Mr H., using silver nitrate one per cent at 9 A. M. and again at 12 o'clock, and extracting the cataract at 2 P. M. Her eye was also dressed every day. Doctor H. V. Halbert was House Surgeon at the time, and assisted me. I mention case 1, 2, 1150 and 1200 especially to show to you and to prove to you the great power silver nitrate has as a practical specific against infection. Of course, I am not advocating operating upon every cataract case that comes along which has serious trouble with the lacrimal apparatus without first performing an excision of the sac. But I do think,

if the eye looks clinically clean and no fluid or secretion can be squeezed out of the sac, and one per cent silver nitrate is used twice in the eye, and at four hour intervals, it is perfectly safe to operate. Investigations made by Elsching and by other workers have proved that in the majority of cases the conjunctival sac contains the pathogenic organisms.

8 In soft or lamella cataracts, I perform a peripheral linear incision with a flap just back of the limbus. Also in all dissections, I enter the anterior chamber through the conjunctiva and sclera, just back of the limbus. The same rule applies to hard cataracts. I make the section in the sclera just behind the limbus, always having in mind a conjunctival flap. I consider it OB-SOLETE to go through the cornea in performing dissections, soft or hard cataracts. Why attack the eye at its weakest point? The chances for infection are greatly increased by using the corneal route.

9 In our list of 1,250 cases we operated upon 415 mature senile cataracts, 80 soft cataracts, and 30 complicated cataracts—making all told, 525 cataracts removed, with two eyes lost from secondary infections coming on nine days after the operation. Not a single case of primary infection or panophthalmitis resulted. We performed 125 dissections on soft and secondary cataracts, 480 iridectomies, 40 Lagrange, and 26 Trephine operations, 30 De Wecker, and 24 miscellaneous operations without a single primary or secondary infection.

It is interesting to note the ages of our patients ranged from two months to ninety years. Eight of our patients with cataract had three per cent sugar in the urine. Sugar is no barrier to the operation unless it exceeds four per cent.

Duane (in seventh edition of Fuchs, page 846) in speaking of my method of preventing infections calls it "Artificial Pre-Operative Leucocytosis," and he further adds "the good results obtained by this practice in eye operations seems well sustained by statistics and the translator believes that it is based on sound theory."

#### ACTION OF SILVER NITRATE

I know that silver nitrate furnishes a marked degree of stimulation to the conjunctiva and in that way leucocytosis is produced. The silver promotes phagocytosis and the formation of antibodies, and in this way puts the tissues into a stronger state of defense against the invasion of micro-organisms. Even were an inflammation produced by the silver, it would only diminish the probability of infection, not increase it, because the leucocytes and their leukins are valuable means in combating bacteria. And what makes the phagocytes so active? It is the pre-operative removal of foci of infection—going after the "Three T's."

The thought has occurred, however, that this preventive effect of the silver salt may be at least in part due to the germicidal action of the silver, and in order to shed more light on the subject a series of 50 cases have been investigated by Doctor S. P. Oast and Mr. E. B. Burchell in the laboratory of the New York Eye and Ear Infirmary.

The following technique was employed on the patients admitted to "The Infirmary." A culture was taken from the conjunctiva. Then according to the Author's technique, several drops of freshly prepared silver nitrate in one per cent solution were instilled into the lower conjunctival cul-de-sac, and the eye left unprotected by a dressing of any sort. After a lapse of two hours, just before the operation, a culture was again taken in the same manner. The material was collected by means of a small platinum loop from the lower conjunctival cul-de-sac, care being taken to avoid contamination with the lids and cilia. This was transferred after the usual manner to agar starch which incubated at 37 C for twenty-four hours and then examined.

#### BACTERIOLOGICAL STUDIES

NO CASES EXAMINED	BEFORE	AFTER
3 Diplococci		No growth
3 Diplococci and Xerosis		No growth
4 Xerosis		No growth
5 Staphylococcus		No growth
1 <i>Subtilis bacillus</i>		Staphylococci
1 Xerosis and Diplococci		Xerosis and Diplo cocci
4 Staphylococcus		Staphylococcus
1 Xerosis and Staphylococcus		No growth
1 Xerosis		Xerosis
1 Streptococcus and Staphylococcus		No growth
1 Xerosis and Staphylococcus		Xerosis
23 No growth		Staphylococcus

We concede the generally accepted fact, that from a practical standpoint, it is impossible to sterilize the conjunctival cul-de-sac, and were this possible of accomplishment, even momentarily, by any anti-bactericidal agent, or method, at our command, as soon as the same had become neutralized or its action spent, infection would immediately recur from the lid margins and meibomian ducts which are constantly contaminating the conjunctiva with their germ-laden secretions. It will be noticed therefore, from the above study that there is but one case which shows, after the use of silver, the presence of any organism (*Diplococcus*), not a normal inhabitant of the Conjunctiva, or whose presence could not be accounted for by contamination in the above mentioned way. Close analysis of the above results will also show that in some of the cases different organisms were found before and after the use of silver, a circumstance which likewise adds

weight to the view of constant contamination in the above mentioned way

The older Ophthalmic Surgeons and writers were extremely averse to the use of any actively germicidal agents in the conjunctival cul de sac just prior to the intra-ocular operations, because of the usually attendant irritating qualities of such materials. They feared the catarrh produced by this irritation with its supposed concomitant increase in the number of bacteria, thereby favoring rather than diminishing the chances of infection. In the light of these present studies, not to mention the corroboration of our clinical experience, there seems little ground for such assumption as regards at least one agent which is capable of very appreciable germ destroying power *in vivo*.

In the present series in cultures taken two hours after the use of silver, in every case, a point was made of obtaining some of the stringy purulent like masses such as are familiar to all who have observed the effect of silver solution in the eye, and it was extremely interesting to observe that the cultures obtained in this way invariably yielded no growth, or a considerably diminished number of colonies. In addition to the silver being a powerful bactericide, I am strongly of the opinion that it increases the phagocytic power of body cells in and around the eye, producing a leucocytosis and leaving the eye protected during the healing process.

#### PREPARATION OF "THE SILVER."

The one per cent of Silver Nitrate (5 grains to one ounce distilled water) should be made up fresh at least every three months, and must be kept in a dark glass stoppered bottle. The rays of light cause the silver solution to become inert, and for that reason it should also be kept in a dark room.

Professor P. Knapp in an Article (Schweizerische, Medizinische, Wochenschrift, April, 1923, Basel) on Modern Cataract operation, makes several observations concerning the use of Agno,

First he refers to the instillation of one per cent to two per cent silver nitrate immediately before the operation. The point of using the "silver" two hours before the operation, which is most important, he has overlooked. The two hour interval gives the silver time to destroy bacteria and produce a leukocytosis.

His second objection was that the silver increases secretion with many bacteria. Our research work at the New York Eye and Ear Infirmary shows that the silver does increase the secretion, but cultures of the stringy, purulent-like masses showed that they invariably yielded no growth or a considerably diminished number of colonies. In other words, two hours after the instillation of the 1 per cent silver nitrate in the eye cultures from the secretion of cul-de sac

showed the absence of the bacteria in 82 per cent of the cases, whereas before the silver was instilled, the cultures were positive in 60 per cent of the cases.

I feel that Professor Knapp is making the wrong application of a good principle. If he will use my technique with an open mind, I feel that he will be pleased with the results. Certainly my clinical results are overwhelming.

The following well-known ophthalmic surgeons in Greater New York are using "my method" in their intra-ocular operations: W. E. Lambert, J. H. Ohly, P. C. Jameson, C. E. McDonald, J. M. Wheeler, F. W. Shine, L. W. Criger, A. Wiener, I. Harishorn, B. W. Key, C. Berens, Jr., B. Samuels, E. V. Darling, T. A. Northcott, and J. H. Dunnington, I. Goldstein and K. Schilvek.

I want to express my thanks to the following members and ex members of the House Staff for their co operation and assistance: Anthony, Peters, Stout, Blades, Richardson, Neff, Hicks, Shannon, Robb, Hogan, Hunsdale, Pierkey, Veasey, McGarvey, Oast, Frost, Lewis and Halpert. Also I want to express my thanks and great appreciation for Doctor S. P. Oast and Mr. L. B. Burchell for this excellent research work.

In addition to the 1,250 cases—the subject of this paper, R. C. Hellebower of Cincinnati reports 300 intra-ocular operations performed according to "my method" without a single primary or secondary infection. Hellebower feels such a sense of security with "the silver nitrate," that he now no longer takes smears or cultures—reliance being placed in the efficacy of the preparatory treatment, and he adds, "the results have been most happy."

#### PRELIMINARY IRIDECTOMY OF PRIME IMPORTANCE.

1st—It is much safer for the patient's eye and better for the surgeon in the long run.

2nd—It protects the eye and leaves it stronger for the years to come.

3rd—If it is the "safe procedure" when a patient has one eye—why is it not a good thing when he has two?

4th—Doing preliminary iridectomies in my clinic and in my private practice have become a "hard and fast rule" with me. This rule applies to all (hard, soft and juvenile) cataracts. It enables me with safety to the eye to do all my operations just back of the limbus. I feel that it is a great mistake to use the corneal route in doing intra-ocular operations.

5th—Some operators and a few patients raise the objection to the iridectomy on account of the necessity of making two trips to the hospital and because the danger of infection is doubled by a two-step operation. W. F. Hardy says, and he is quite correct, that the operator raises these

objections in his own mind much oftener than does the patient, and he adds "if an Ophthalmologist is thoroughly convinced that a certain line of action is the correct one, he will have little trouble in putting that conviction over to the patient and gaining his consent" As far as the extra chance for infection is concerned, I feel that I have been able to eliminate that argument

6th—I agree with Darrier and Hardy, who are strong advocates of preliminary iridectomy

7th—If you want every cataract operation to be successful, then I advise "my technique" and a preliminary iridectomy I hold and believe that it is the only way to get a good surgical result in every case These are the conclusions that I have reached after doing cataract work for over 20 years

### DISCUSSION

J H OHLY, BROOKLYN The instillation of silver nitrate before operation for the prevention of wound infection so successfully employed by Dr Bell I have been using some 2½ years During this time I used this method in 275 cases of intra-ocular operations, in which are included 105 cataract extractions

These cases were taken from my clinics and private practice and were operated upon at the Brooklyn Eye & Ear Hospital

My results were most satisfactory, no wound infection occurring in any of these cases

The method as advocated by Dr Bell was strictly adhered to, namely, two hours before operation a few drops of a 1 per cent silver nitrate solution was instilled into the conjunctival sac, and at the end of the operation a 25 per cent solution of argyrol was used

The night before operation a cathartic was given, usually a dose of castor oil

Conjunctival smears were taken in a few of the earlier cases, especially in those cases which gave clinical evidence of conjunctival involvement The majority of these smears were negative, some showing unclassified bacteria, staphylococci, diplococci and pus In the last two hundred cases no smears were taken

In those cases of cataract complicated with a chronic dacryocystitis I understand Dr Bell does not hesitate to operate after irrigating the lachrymal sac

Three such cases are included in my list of cataracts I feel it safer to first extrapate the sac before performing the cataract extraction, which was done in these cases

In all cases the silver produces a slight conjunctival reaction and at the time of operation a

stringy mucus secretion is present in the conjunctival sac This was thoroughly removed by irrigation Occasionally the reaction produced was quite intense, as shown by œdema of the lids and marked chemosis of the conjunctiva

I found these eyes remarkably free from secretion at the first dressing, and in some cataract cases the operated eye had less secretion than the non-operated eye, both eyes having been banded

Silver nitrate has long been recognized as a most valuable antiseptic Its use in ophthalmia neonatorum and in gonorrheal ophthalmia has not been replaced despite the many newer and less irritating silver preparations I believe its value is not primarily due to its germicidal action, despite the experiments conducted under Dr Bell's supervision, but rather as Hirschberg has long ago stated, to the formation of an insoluble silver albuminate with the superficial tissues, which, being thrown off, carries with it in its meshes the bacteria from the superficial layers of the conjunctiva Thus a mechanical cleaning is produced

The irritating qualities of this salt produces a local leukocytosis This leukocytosis is nature's most efficient way to combat bacteria

In one case of double-sided congenital cataract in a 2-year-old infant, a lens dissection was performed in each eye Silver was used and no complications arose Six weeks later a second dissection was done on the left eye The same operative technique was employed On the first dressing 24 hours later, both lids were red and swollen, the conjunctiva intensely chemotic and injected, the eye filled with muco purulent secretion, the corneal wound gray and infiltrated, the aqueous was cloudy, the iris discolored, and a 3 mm hypopyon was present A typical picture of a severe wound infection On investigating this case, I found that a new nurse in the ward had failed to instil the silver solution in this eye previous to operation No smear was taken from this case before operation I feel certain that had the silver nitrate been used at this second operation, as it had been used at the first operation, that this wound infection would not have occurred

Fortunately post-operative wound infection with rigid asepsis and modern technique is a rare occurrence Therefore, if this most simple method renders such infection less frequent or eliminates it entirely, then ophthalmic surgery has received a great gift

I am now using Dr Bell's method as a regular routine in all intra ocular operations, and my results since using it have all been good as stated before

## THERAPEUTIC USES OF ELECTRICITY, X-RAY, ULTRA-VIOLET RAY AND RADIUM METHODS AND RESULTS \*

SINCLAIR TOUSEY, A.M., M.D

NEW YORK CITY

**I**N presenting this paper it will be my endeavor to show a few of the beneficial effects of electrical agencies and radium and to give the methods which I have found best in my own work.

The X-ray and radium in cancer are so familiar to you and this is so wide a field that it can only be alluded to in the briefest manner.

Skin cancers at practically any stage are curable by the X-ray or radium. One should not excise a section for microscopical examination. Such a biopsy is a direct invitation to metastases and general carcinomatosis. The radiation is limited to the lesion and a small surrounding area and is strong enough to produce a decided erythema followed by exfoliation. Often a dry scab comes away, leaving a healthy healed surface. The opinion of the Mayo and many other surgeons is that this treatment is preferable to surgery.

High frequency currents applied either as a high tension Oudin spark, say half an inch long, or as a low tension D'Arsonval current from a needle in direct contact, in a few seconds destroy growths which have such a mass of tissue that destruction would require an inordinate intensity or duration of radium or X-ray, if treated in that way. An example is a fleshy mole without any tendency to recur, and another is a nodular cancer of the face. For the latter radium would be applied in addition to the electrodesiccation or the electrocoagulation and the neighboring lymphatic glands would be X-rayed.

Return after surgical removal of cancer of the breast is best guarded against by X-ray applications to the breast and axillary glands a day or two before the operation and a series of X-ray exposures of the region of both breasts, axillae, supra clavicular regions and the pelvis within a few weeks after the operation. These prophylactic applications should be made every six months and occasional radiographs of the chest to promptly detect any secondary mediastinal tumor. If the latter occurs it calls for treatment by highly penetrating X-rays, say with  $11\frac{1}{2}$  inch gap.

Cancer of the uterus always gives the patient a better chance if X-ray applications are made to the whole pelvis, and radium applied to the uterine canal and to the cervix a few days prior to the operation. And after the latter frequent courses of X-ray and radium are desirable. As an example a 50-milligramme radium tube may be

placed in the uterine canal for 10 hours every other day for three times and if the cervix is affected one 10-hour application may be made to that. This might consist in a 50 milligramme tube in the cervical canal or needles containing that amount buried in the cancerous neck of the uterus.

Not malignant conditions often call for X-ray treatment.

Exophthalmic goitre should always have an X-ray examination of the teeth and any focus of infection there or elsewhere should be cured. A test of basal metabolism or a test by the administration of iodine or of thyroid extract will show whether the case is one of hyperthyroidism requiring doses of the X-ray or radium sufficient to convert part of the gland into fibrous tissue, or hypothyroidism requiring stimulating doses of the X-ray. It is in the latter cases that I have especially noted the benefit from X-raying the thymus gland. These stimulating applications have to be kept up for many months and an example of dosage with my own apparatus is  $11\frac{1}{2}$  inch gap, 2 ma, 0.7 m m zinc and 6 m m wood filter, 16 inch distance, 6 minutes to thyroid and 6 minutes to thymus, about once a week.

Most cases of both types are curable and I have a patient under treatment for a uterine trouble who had to be brought up from Wilmington, N. C., by her physician 18 years ago, with a pulse that was never below 120, such palpitation that it shook the whole bed, tremors so that she could not pour out a cup of tea, and great nervous prostration. She was entirely and permanently cured.

**Prostatic Hypertrophy.** This is one of the most important fields for X-ray therapy. Hard ribs are used and a dense filter. Applications are made to the prostate through the perineum with a  $2\frac{1}{2}$  by 3 inch diaphragm. Also through numerous other portions of skin at the outlet of the pelvis so as to secure a crossfire at the prostate without unduly exposing any particular area of skin. Supra pubic applications are also directed toward the prostate. The results are excellent in many cases. One patient, himself a physician, had been absolutely dependent upon the catheter for several years and has never had to use it since the course of treatment.

Stimulating doses of the X-ray applied to the pituitary gland are the basis of the X-ray treatment of deafness and act by secondary stimulation of the auditory nerve. High frequency currents are also applied to both auditory meat.

Some people have been enabled to throw away

their ear trumpets. Some others are sure to be disappointed, but I advise a trial in all cases, because I have seen marked benefit even in cases with complete loss of the drum membrane and great destruction of the ossicles.

The hearing has also been improved in the cases recently treated at my office for chronic suppurative otitis media. For these the X-ray doses have been greater and have reached cells which chemical applications could not reach and which very severe surgery would have difficulty in disinfecting. The pain and discharge have ceased and the hearing has been improved, perhaps partly because some of the X-ray has reached the pituitary gland.

Stimulation of the pituitary gland was the theory upon which benefit was obtained in a case of blindness from atrophy of the optic nerve. The case was referred to me by Dr. George Huston Bell, attending surgeon at the New York Eye & Ear Infirmary.

#### CASE OF BLINDNESS FROM OPTIC NERVE ATROPHY BENEFITED BY X-RAY THERAPY

The case was referred to me May 1st, 1922, by Dr. Geo. Huston Bell, who writes the following report under date of September 14th, 1922:

"Patient age 25, soldier who saw service in France, came to see me practically blind. He had to be led into my clinic. Diagnosis was made of Optic Atrophy. Both nerves very white and the blood vessels very much contracted. It was a typical case of Optic Atrophy.

"I looked him over for the 'Three T's' (teeth, tonsils and toxæmia). Had his teeth X-rayed. Had his tonsils removed and placed him on my 'reform diet.' Also had a blood and spinal Wassermann on him, both of which were negative. It was then that I decided on the X-ray to the temples and back of the head, which you very kindly gave him. I don't know how many treatments this man has had.

"The last time I saw him he was much improved. He could walk around through the rooms and could see large print in the newspapers.

"There is no doubt but that the patient has been improved by the X-ray treatment."

The possibility of benefit occurred to Dr. Bell from the cases of deafness which are benefited by X-ray application to the pituitary gland.

When I first saw him at my office he said that he could not perceive form at all, only light and shade, and he could not make out even the largest letters in the newspaper advertisements.

Treatment was with X-ray applied to areas  $1\frac{1}{2}$  inch in diameter with the X-ray always directed toward the pituitary gland. On the first day, one minute, from each side above and in front of the external auditory meatus, one minute each; at the next treatment two days later, from the root of the nose and from above the occiput, one

minute each, and three days later the tip of the nose and far above the occiput, one minute each. The distance from the anticathode to the skin was 16 inches; the rays were of great penetration, corresponding to  $11\frac{1}{2}$  inch gap, 2 milliamperes and a zinc filter 0.7 millimeter thick.

At first he reported no change in vision, but on May 9th, after a few treatments, he said things were looking brighter and that day he read the word *Coats* in an advertisement. On May 13th he could see pictures in the newspapers. At the next visit he read the word *California*, and on May 20th he went to the N. Y. Eye and Ear Infirmary without an attendant, though Dr. Bell says he would have assuredly been absolutely blind by that time without the treatment.

Improvement continued during a vacation without treatment and our hope is that it will prove to be permanent.

*Uterine Fibroids* usually disappear, hemorrhage ceases and amenorrhea is induced by X-ray applications. The lower half of the abdomen is divided into four areas and the sacrum into two. At each application only one area is exposed and the rays all concentrate upon the ovaries and uterus. With highly penetrating rays the necessary deep dose is applied without affecting the skin. Several areas are treated at a session. Radium is often applied in the uterine canal as an adjunct.

*Menorrhagia* in a young woman without fibroid would not be treated by the X-ray, because the benefit of that agent is largely dependent upon its arresting ovarian function. Moderate intrauterine applications of radium are preferred.

*Leucæmia*. The X-ray applied over the long bones affects the blood-forming cells, and both the white and red cells become more natural in number and the patient's health improves wonderfully. Glandular masses respond promptly to X-raying and so does the hypertrophied spleen. But the applications to the spleen are not the primary treatment and are to be very mild and infrequent. Stronger applications to the spleen throw too much work upon the kidneys in the elimination of the debris. The spleen is the last thing I treat in such a case. The improvement in health is magical, but unfortunately there are usually relapses.

Skin diseases of many varieties respond wonderfully to the X-ray and except in malignancy it is best not to produce an erythema. If this rule is followed there is not likely to be any subsequent atrophy or telangiectasis. With the proviso of accurate dosage Acne even with comedones is usually cured, and the scars left after other forms of treatment, avoided. Ringworm of the scalp is cured by an application causing every hair to fall out carrying the micro-organisms on

the roots which could not have been reached by any chemical agent. Keloid and disfiguring thickened cicatrices may be cured by the X-ray, but radium is often preferred for small areas. Psoriasis is wiped off in a magical manner, and I have had permanent cure in some cases. Other cases have returned and then the cure has been completed by chemical applications. Every case is examined with the X-ray for dental infection which would doubtless prevent a cure. Tubercular fistulae of the skin and subcutaneous tissue are often cured by X-ray or radium.

Chronic suppuration in the middle ear, also about tendons which have sloughed, and in other situations where chemical agents cannot act effectively are often cured by X-ray or radium. In the case of the middle ear and mastoid, of course this is accompanied by relief of pain and improvement in hearing.

Tuberculosis is one of the fields for X-ray therapy. The joints are often cured, the larynx should be treated and at a quiescent stage in cipient tuberculosis of the lungs is sometimes cured. It seems probable that recent improvements in X-ray therapy will give more hope than formerly for tuberculosis patients. Of course sunshine and ultra-violet ray are essential in treating tuberculosis, especially of the joints.

**Radium.** Cancer when on the surface yields readily to radium instruments simply laid upon it. If nodular this may be supplemented by the high frequency electric spark with or without curettage, and if of the face, but extending more deeply, the periosteum may also require removal.

Radium tubes each containing one millicurie or less of emanation may be permanently buried in a cancer of the cervix uteri or of the vulva, one c.m. apart. By the time they have lost all their strength the surrounding cancer cells have lost their dangerous character. Needles, containing 10 or 12½ mg. of radium element are thrust into an inoperable cancer of the breast, one centimeter apart and removed after four or six hours. There is slight necrosis along the path of the needle but this devitalized tissue is absorbed without any suppuration or sloughing. The cancer shrinks and becomes innocuous for a long time in favorable cases. The needles are sometimes temporarily burned in a cancerous lip or tongue. In some recent cases of the latter I have laid the needles on the surface of the ulcerated and fissured tongue. The area was later covered by a slough which I hope will leave a healthy surface. In other cases needles transfer the healthy tissue beneath and around the ulcer.

Disfiguring cicatrices are best treated by radium and I have reported the case of a nurse whose hand was completely crippled from contractures following extensive incisions for septicæmia. The tip of the thumb for instance was permanently bent down within half an inch of the middle of

the palm of the hand. Radium applications softened and relaxed and free the cicatrices to such an extent that an operation became possible and now the patient is a stenographer and typist.

I have treated several cases of Dupuytren's contraction of the palmar fascia with radium. One case was cured, the others have been unproved or arrested, and none of them have been operated upon. I always make radiographs of the teeth.

Painful fissures of the anus or elsewhere are cured by radium, one application generally sufficing.

Corns which have become so inflamed that amputation of the toe was under consideration are cured by one or two radium applications.

**Vernal Catarrh.** A chronic recurrent conjunctivitis in which the inside of the upper eyelid is covered with growths resembling soft warts or granulation tissue. The lid is everted and a 20 milligramme glass tube of radium covered with the thinnest rubber dam is applied to different parts of the inner surface of the upper eyelid avoiding the margin of the eyelid so as not to affect the eye-lashes. The cornea is shielded from the radiation by a very smooth metal shield slipped in under both eyelids. The tube which I use is one imported for me eighteen years ago and is said to contain 20 milligrammes of radium salt having two million activity. It has never been idle long enough to be sent to the bureau of standards at Washington to be tested as to the amount of radium element contained. So that dosage with this tube, thirty-five minutes through thin rubber dam, might have to be modified if applied with some other 20 milligramme tube.

An ophthalmic disc of cocaine is put into the eye before the eye ball shield is introduced. A second treatment is sometimes desirable a month later and a third one six months after that. A dozen cases referred to my office by Dr. Geo. Huston Bell and others are all said to be permanently cured.

**Tonsils.** The X-ray causes hypertrophied tonsils as part of a constitutional disease like leucæmia to come down to a normal size almost over night. I have also used it with the most satisfactory results for chronic suppuration in shreds of tonsillar tissue and crypts left after tonsillectomy and producing constitutional symptoms. For both these cases one or two external applications are made of X-rays representing a six to nine inch spark, 2 milliamperes, 3 m.m. aluminium filter and ten minutes exposure.

The hypertrophied tonsil which would formerly have been removed by tonsillectomy or tonsillectomy requires a whole course of X-ray treatments perhaps nine, and all operators do not report success. My own preference in such cases is for a radium needle, ten or twelve one half milli-

grammes thrust into the tonsil and left in situ for three or two and one-half hours. The entire mass of lymphatic tissue is changed into a small flat area of fibrous tissue covered by smooth mucous membrane.

*Cancer of the liver, stomach, and intestines and the viscera*

Even when an operation is impossible and these cases seem hopeless they should not be considered as beyond relief. I have reported a case of pericecal malignant tumor secondary to carcinoma of the ovary and with almost absolute obstruction of the bowels, kept alive and most of the time very comfortable for eleven years after the first operation. The treatment was a combination of surgery, X-ray and radium. And I have reported a case of carcinoma of the uterus in which the pelvis was found by the surgeon to be a solid mass of cancer. Apparently perfect health was restored by the X-ray alone but a permanent cure could hardly have been expected and the patient died a year and a half later from some stomach symptoms. Comfort and prolongation of life are often obtained in hopeless cases.

*The Mercury Vapor Quartz Lamp* I employ this name in preference to the Ultra Violet Ray because the latter term has come to be connected with high frequency vacuum electrodes, which apply only a trace of ultra violet light and whose benefit is not due directly to the ultra violet ray.

The water cooled Kromayer quartz lamp has quartz applicators intended to be pressed against the skin or mucous membrane and so blanch the tissues. Blood absorbs these rays and excluding it increases the effect upon the tissues. This is the lamp used for a bactericidal effect and for a sedative or a counter-irritant effect according to the dosage. It is not used to destroy tissue but in some diseases it should produce a mild or severe erythema even with vesication which, however, is not painful. The use for which it was invented was in the treatment of lupus vulgaris and for most cases it is the best application. Many other skin diseases and also portwine stain and other birth marks, the red marks sometimes remaining after radium treatments, alopecia areata or baldness in patches are cured by this treatment. Cases of dental infection with drainage such as pyorrhoea or after the extraction of an infected tooth are best treated by pressing the quartz applicator directly against the gum at three or four places around both surfaces of the apex of the root. The application is calculated so as to produce a productive reaction, upon the subsidence of which, the infection is found to have ceased and if the tooth has been loose it is firm once more. It should be noted that there is no warmth and the dosage is a matter of knowledge on the part of the operator, not guided by the patient's sensations. Applications inside the nose in hay fever, in the rectum in prostatic cases, to

the vulva in cases of pruritus and in the vagina for cervical erosions and various inflammatory conditions of the uterus are only part of the long list of uses of the Kromayer quartz lamp.

The quartz lamp for distant application, like the Alpine Sun lamp, or the Burdick Lamp of a similar type has a wonderful effect as a general tonic, for instance as already alluded to in the treatment of anæmia from leucemia and other causes where it sometimes raises the red cells from 2,000,000 up to 4,000,000. Tuberculosis in any location and debility from ovarian, uterine or any other disease is benefited by exposure of the major part of the body to the rays. In the cases of anæmia the first exposures are only 30 seconds from a distance of 36 inches. And the treatments are gradually made longer as to time and from a shorter distance until after the skin has become tanned, but in these general treatments never vassicated. Finally applications of ten minutes at a distance of 24 inches may be given. Most skin diseases are suited for this treatment, those with crusts responding better if these are first removed. Baldness is one of the lesions where the most brilliant success is often obtained. Stimulation amounting almost to a painless vassication is the most beneficial effect. We must remember that it is a cold light and not count on the patient's sensations to regulate the dose. In fact even in some of the lesions like keloid requiring a severe erythema there is scarcely any redness of the skin until hours later. Myalgia, neuralgia, neuritis, lumbago, herpes zoster are usually quickly benefited by applications from a distance mostly of a mild type but for lumbago decidedly counter-irritant.

*Static electricity* Debility following illness or an operation, or for instance consequent upon the strain of seeing the illness and death of one's husband, is cured in a remarkably short time. The patient sits on an insulated platform charged from the positive pole while a crown from the other pole is three or four feet from her head. The second part of the treatment is the application of a series of isolated sparks along the spine, not a stream of sparks at one spot which would be painful. Insomnia is benefited by static insulation and head breeze without spark. Sprains, congestions of the liver or kidneys, spondylitis prostatitis and inflammatory deposits in general are relieved by the static wave current with or without Leyden jars depending upon the intensity of the effect desired. The patients say that they like it, but the Leyden jar discharge sounds like a machine gun.

*Sinusoidal currents* These when slow are practically galvanic currents which are so gradually varied as to direction and strength that no muscular contraction is produced and no chemical or polarizing effect. It is the speaker's belief that this has a better effect upon paralysis than the

currents which cause muscular contraction like abrupt interrupted galvanic or the faradic or the rapid sinusoidal current. Infantile and other types of paralysis, writer's cramp and other cases of agrophia have given successful results, very often applied by the four cell bath where the current can be directed at will so as to pass from one hand to the opposite foot or any other combination of the four extremities.

Constipation may sometimes be cured by radiant light and heat applied to the abdomen and sinusoidal currents, one electrode at the epigastric region and the other at the lumbo-sacral region.

The Galvanic Current when turned on or off abruptly has the power of exciting muscular contractions which make it one of the most valuable diagnostic and prognostic agents at the command of the neurologist.

It is a time honored belief that these contractions are useful in maintaining the nutrition of paralyzed muscles and that this adds to their value in the treatment of paralysis. I have come to believe, however, that the contractions are not to be desired, that it is the current and not the contraction of the muscle that is beneficial and personally I treat paralysis with the sinusoidal current of a strength and frequency not to cause more than a trace of contraction in a healthy muscle and none in a paralyzed one. It is marvelous to see the rapid recovery after facial paralysis from exposure, under this treatment. There is nothing so good as the galvanic needle for superfluous hair on the face and for small dilated blood vessels and for some small growths. We use the negative polarity of the galvanic current for painlessly dilating the uterus for the introduction of radium applicators. I have not employed mercuric cataphoresis for cancer, preferring radium or fulguration.

**Obesity.** The treatment inaugurated by Bergoiné, one of the greatest of French electrotherapeutists, consists in exciting contractions in many different muscles while excessive movement is prevented by sand bags or bands. Each contraction is accompanied by the oxidation of a certain amount of carbohydrates such as fat as well as the production of perspiration and the loss of a certain amount of weight. The fat may be removed from the breasts, abdomen, thighs, hips and other parts as may be desired. There are many reasons why this should be done under medical supervision and not for instance in a beauty parlor. The increased oxidation and elimination of waste products require that the renal functions should be kept track of. The contractions while vigorous must not strain the respective muscles. Properly applied it not only removes fat but is also a remarkably efficient general tonic.

A special reclining chair is used in which there are large, stationary electrodes for the patient to

lie upon and to rest the arms on. Other movable electrodes are laid upon the body and limbs with sand bags on top of them.

The author employs a sinusoidal galvanic-faradic current rhythmically interrupted eighty times a minute. There is no effort on the part of the patient but the parts under the electrodes become bathed in perspiration.

**High frequency currents.** With perhaps hundreds of thousands of alternations per second motor and sensory nerves cannot respond and there is no electrical sensation and no muscular contraction. These currents may therefore be applied in a strength which is prohibitory with the other currents mentioned. And it is no exaggeration to say that they are indispensable in electrotherapy.

The Oudin current from the high tension terminal of the high frequency apparatus is frequently applied from a vacuum electrode or from a non vacuum condenser electrode. This with rather a high voltage which would produce considerable spark effect if the electrode were not kept in close direct contact with the skin, is applied to the chest and abdomen in cases of low arterial tension. It is used in some severe cases of myositis and in cases of multiple warts. I treated a man who counted two hundred on his face and I used in addition to the current, applications of formalin to the warts but not to the sound skin and gave him 3 ounces of lime water three times a day. The same electrode with a lower voltage current so that there is scarcely any spark effect is wonderful for phlebitis, rheumatism, gout, sciatica, neuritis, myositis, and for sacro iliac and lumbar pain. Most of these I treat with the least possible spark effect. The skin is powdered to enable the electrode to glide over the surface without breaking contact. Or the application may be made through one very thin garment. But occasional patients like and do better with a higher voltage. One doctor friend of mine came with a biceps swollen up and as sore as a boil and a very strong current was applied, but of course preventing sparks by perfect contact with the electrode in rapid motion. A single treatment resulted in a complete cure. Pyorrhea has been successfully treated by the same mild application from special vacuum electrodes, combined with mild X-ray applications. The pain, bleeding and suppuration have disappeared and the teeth have tightened. We have not hoped for the restoration of the absorbed alveolar process. No reaction need be excited.

**Intermittent Claudication.** The attacks of agonizing cramp in the leg muscles which often are indicative of local arterio-sclerosis are either entirely cured or lessened as to severity and frequency by high frequency currents. I have often employed the vacuum electrode but diathermy is as good or better.

*Colitis* with large liquid movements resembling a tangled mass or worms has been cured by Oudin high frequency currents of high tension but very moderate milliamperage applied to the abdomen

*Diabetes* Under X-ray and high frequency applications to the region of the pancreas and liver in one patient the sugar diminished from three one third per cent to zero, with corresponding improvement in the other symptoms. I haven't been able to learn the ultimate history of the case, but she was well a year later while her husband who had been on ordinary medicinal and dietary treatment died of diabetes on the way to their home in Porto Rico

*The high frequency spark fulguration and electrodesiccation*

This also is from the high tension terminal of the high frequency apparatus. A stream of sparks is applied from a metal electrode held at a distance and this causes the part to swell up and turn white. The growth destroyed in this way is sometimes left to come away like a dry scab, leaving a healthy healed surface, or it may be easily curetted away at the time. Small single growths of the nature of warts, fleshy moles or birthmarks are removed in this way. But for more extensive destruction one of the low tension terminals is connected with a very large flat electrode upon which the patient lies and the other low tension terminal is connected with a metal electrode like a knitting needle which when applied directly to the tissues produces Electro-coagulation. Applied to cancer it may be accompanied by curettage and if deep-seated by surgical removal of the periosteum. It is the regular electrical removal of the tonsils but I feel that radium is better

*Diathermy, thermopenetration*

A low tension high frequency current passing through any part of the body generates heat in the tissues themselves not just warming the surface like a hot water bottle. This effect upon the tissues is of wonderful benefit in a great many constitutional and local diseases. I have regarded it as the only application that will cause the disappearance of gouty nodes. It often cures neuralgia, neuritis, spondylitis and is of the greatest benefit in congestion of the liver, Bright's disease, high arterial tension, arteriosclerosis, angina pectoris and obesity. The low tension terminals of the high frequency apparatus may be connected with electrodes at opposite parts of the region under treatment, or the wire from one terminal may go to an auto condensation chair or table upon which the patient sits or lies and the other to an electrode which may be held in both hands for a general effect, or may be applied to some part like the liver. Or for the face in neuralgia this electrode may be held in the pa-

tient's hand, or fastened to the wrist, while the hand strokes the painful part of the face. Part of the current enters the face from the hand. A part of the treatment for deafness consists in the patient holding an electrode in each hand while, say, the two index fingers are held at the external auditory meati. Any local part under treatment has a pleasant sense of warmth and with the larger electrode and the stronger current of 1,000 or 2,000 ma the whole body feels all in a glow. An example of the benefit from what may be called a general application is seen in a man with blood pressure of 230, large amounts of albumen and casts in the urine, abdomen and even the scrotum having to be tapped on account of dropsical pressure, great weakness and discomfort. In a couple of weeks the blood pressure has come down to 170 and the entire clinical picture has changed.

The static induced current, with Leyden jars is part of the treatment in many of the cases mentioned.

*Radiant Light and Heat*, less desirably termed baking

As a local application this is splendid for pain and disability persisting after sprains or fractures, some of which cases require also an X-ray examination of the teeth, and in neuralgia, neuritis, high arterial tension, obesity, gout and rheumatism. Applied to the abdomen it is curative in some cases of constipation for which it is combined with sinusoidal currents applied to the epigastrium and lumbo-sacral region.

#### NOTES OF TECHNIC

X-ray deep technic 11½ inch, 2 ma gap, 0.7 m m zinc, 6 m m wood, 16 inches, a full dose about 60 minutes. Total dose for each area in treating fibroids 35 minutes. Cancer about 60 minutes. Fractional doses frequently repeated in different areas, for a stimulating effect upon the pituitary gland one minute three times a week, as an indirect bactericide upon tubercular joints four minutes from three directions total twelve minutes, every ten days. Tonsils ten minutes frequently repeated.

X-ray superficial technic 6 inch gap, 2 ma 0.2 m m zinc, 10 inch, 16 minutes, exposure distributed over three weeks.

Radium Superficial technic, glass tube 20 milligrammes of salt of 2 million activity, thinnest rubber dam as filter, time 18 minutes upon the most delicate skin up to 35 upon the toughest. Both are for a superficial destruction and prophylaxis against recurrence of a new growth.

Slightly deeper effect without destruction, tube or needles in one m m brass or thin lead and one m m rubber, 20 mg of salt of two million activity once a week for an ulcer with suspicion of malignancy.

Cancer, 10 mg needles imbedded, one cm apart

for 6 hours or 12½ mg needles for 4 hours Surface applications 12½ mg needles, 1 m.m. brass and 2 m.m. rubber or felt and ½ inch apart 12 hours would cause a burn Half an inch of felt should be used and the time should not be more than six hours for cancer, for the infected wrist mentioned in my paper there were 9 treatments 13½ minutes each in four weeks

Diathermy for a small part with the electrodes close together probably not more than 100 ma For the body seated on autocondensation pad and holding a large metal cylinder in both hands about 950 ma For the body with large metallic electrodes soaked, on the skin front and back 1,000

or 1,500 or even 2,000 ma regulated so that there is no faradic sensation or any spark sensation and so that there is an agreeable sensation of warmth For the ears in cases of deafness one terminal goes to an uninsulated metal electrode held in the palm of the right hand and the other to one in the left hand A finger is pressed into each ear and a considerable part of about 300 ma of current passes through the ears The fingers are pressed closely into the ears to avoid a tiny shower of sparks and the current is regulated to a strength which warms up the entire external auditory canal

## STUDIES OF THE DEAF CHILD \*

By GEORGE B McAULIFFE M.D.  
NEW YORK CITY

THE problem of the handicapped child has occupied the educational authorities more and more during the past decade The blind the crippled, and the tubercular have received the special attention they deserve. *The deaf hate not* There are about 600,000 school children in New York City There has been no systematic combing of this number to determine the handicapped deaf The school for the deaf was established here about fifteen years ago It has a register of 332 I have been a volunteer attendant for the past twelve years and this paper is a short summary of my observations

Inasmuch as the Board of Education does not recognize the necessity of a regular audit we must depend on the teacher for a lay diagnosis The pedagogues do not evidently assent to the dictum of Dr James K Love, "That the deaf child should be raised to the status of a patient"

Last winter a circular was sent to all the schools giving teachers simple tests for the detection of deafness among those losing ground or appearing dull Some schools responded, others did not About 600 names were reported These are being examined now Some were found to have intermittent deafness and were advised to have treatment Others were told to have a front seat and report again in six months A few defectives were sent to that division Those who were handicapped by their deafness were recommended to come to the school where in small classes with specially trained teachers they learn lip reading and we find that they are not dull but can accomplish the work of a grade They are thus enabled to complete the work of the regular schools and graduate The time required is generally about three years more than the regular school time It is at first slow

because they are in a mental twilight from the lack of the mental stimulus of language They begin school at five years The deaf child of that age is the equal of a hearing child of two or three years Under proper education at fifteen years the deaf is almost the equal of the hearing child

Inasmuch as the initial diagnosis comes generally from the teacher especially in the lighter cases, they should be instructed to watch for inattention, reverie, and listlessness in their pupils They should observe the tilt of the head and the facial expression in order to detect possible deafness Too many children are classed as defectives simply on their apparently poor intellectual response.

In a recent examination of 314 deaf children of the school I found 80 per cent of nerve deafness, and 20 per cent of conduction deafness There were 54 per cent totally deaf, 46 per cent partially deaf The latter were mostly children who had failed to keep up with their classes in the regular schools They had been sent for examination because they were dull

When we study out the etiology of the deafness of this number, we find that 152 were born deaf In 42 the cause was cerebrospinal meningitis, in 18 measles in 11 whooping cough, in 12 scarlet fever, in 7 convulsions from an undetermined cause, in 5 diphtheria, in 9 pneumonia, in 3 influenza, in 5 typhoid, in 8 accidents, in 1 chickenpox, in 2 infantile paralysis, in 1 rheumatism, in 36 catarrh

Thus we find the congenital deafness is practically 50 per cent Cerebrospinal meningitis gives us the greatest number of acquired deafnesses Measles is ahead of scarlet fever, contrary to generally accepted statistics which accord 8 per cent to measles against 15 to 42 per

cent from scarlet fever. We are more apt to have nerve deafness from measles than from scarlet fever. Whooping cough is causative in many cases, and I find influenza beginning to show more nerve lesions than was thought. Most of the aural lesions of influenza were catarrhal, but with the increasing potency of grippe each year we find more cases of nerve deafness from it.

We find consanguinity still operating as a cause of congenital deafness. Eight cases had parents who were cousins, and one had a father whose wife was his niece.

Four children had deaf parents (both parents deaf). The statistics of familial deafness are extremely instructive. In 38 families having children attending the school there were 2 deaf children in each. In 7 families there were 3 deaf children. In one Italian family of 10 children, 2 were deaf. One of the girls who heard perfectly, married a man with perfect hearing and not related to his wife. Their child was deaf. Three of our children have deaf parents. In two cases there is only the one child, in the third case there are three children, the older two are deaf, the youngest hears but speech is poorly. One child with deaf parents is only slightly deaf, and has a brother who hears perfectly.

Many authorities have given figures to show this congenital factor in deafness. Deaf persons who have no deaf relatives will have 12 per cent of deaf children. Another says that intermarriage of persons with deaf relatives will result in more than 50 per cent deaf children whether the marriage is between deaf people or not. It thus seems to become a matter of eugenic control as much as the necessity of a prenatal negative Wassermann. I have tried to determine the influence of a weakened luetic dyscrasy but however much we may suspect, we lack as yet objective proof. The Wassermann test is generally negative. It may be that X-ray examination of the long bones may elicit some proof.

Of the 314 cases examined, 25 have had their adenoids and tonsils removed, 43 have nasopharyngitis, 20 have adenoids, 36 have enlarged tonsils, 16 have deflected septum, 50 have running ears. Five of the 50 come from good homes.

It is surprising how many of the nerve deaf cases have had their adenoids and tonsils removed. Parents are led to believe that the hearing may be improved by the operation, and no doubt the advice came from physicians. This fact is susceptible of several interpretations, showing not entirely an accord with the higher standards of ethics. Thirty children were taken out of school and treated by chiropractic methods for months. Most of them gradually drifted back. Extensive and alluring advertisement of supposed cures tempt the parents to try the new

treatment. One of the methods which is borrowed from the aurist consists of the digital manipulation of the fossa of Rosenmüller—an acknowledged benefit in catarrhal cases but of no avail in these.

The indifference or ignorance of the parents in the cases of running ears is unbelievable. We have children sent for examination whose ears are never washed out. Some have had radicals and are foul with discharge and debris. The school nurse, after their admission to the school, takes them in hand. After daily irrigations the improvement is remarkable.

The examination of the children to determine their deafness is done as follows. I speak to the child as he sits down before me with my hand covering my lips. I watch to see whether he looks at my mouth or not. I ask him his name, or his class, or what day it is, and note his voice. What I call the deaf voice is so characteristic that once heard it is easy to recognize. It has no modulation, and the vowels are prolonged. The voice bears out what Makuen says: "That the deaf mute who learns to modulate his voice has some hearing which may be improved." The non-modulated voice shows total deafness.

If the child answers in a low voice, which is more or less natural, I put it down as a catarrhal voice. I examine the drumheads. If I find no evidence of tympanic change, I think it is more of the nerve type, assuming the child is deaf.

I sound a tuning fork and put it to his ear and ask him if he hears it. If he says he does I get his concept of the sound. Some will say it is a noise, some a whistle, some will call it music, and some will imitate it. After I have got his idea of it, I use his term to express it. I sound the tuning fork again and ask him if he hears the music, whistle, noise, or whatever he calls it. I sound it again, and as I bring it up, I grasp the tines of the fork to stop the sound without his knowledge. If he is intelligent, he will say he does not hear it. I vary the procedure several times to test his veracity.

I then place the vibrating tuning fork on the mastoid, and ask him if he hears it. I sound it again and slide my fingers up to stop the sound before I place it on the mastoid and ask him if he hears it. This I vary a few times to test his truthfulness. It now remains to determine if he hears the sound or vibration. As you know very often they will feel only the vibration and not hear the sound. It is the most difficult point in using the tuning fork as a test. For a long time I was unable to discount this in the examination.

There is no doubt that the deaf child feels vibration through the ears which cannot be translated as sound. As Doctor Love says: "The touch center grows at the expense of the contiguous inactive gray matter." The interesting experiments of Professor James show that this

peculiar sense of vibration goes way beyond our ordinary sensation, so much so that the pressure of the atmosphere is varied by the approach of an object or a sound. Its withdrawal is also felt. It is one of vastness in two or three dimensions. The subject can sometimes differentiate solid bodies from one with perforations. It can be appreciated by a unilateral deaf ear. Totally deaf persons can dance in perfect time, feeling the vibration of the music through the floor. That is the reason why if you stand behind a deaf mute and grasp his shoulders he will apparently hear you when you talk. Stand in front and cover your lips with your hand to kill vibrations and lip reading, and talk. He will look blankly at you.

While using the vibrating tuning fork on the mastoid, if I am uncertain whether he hears it or feels the vibration, I take a wooden tongue depressor and lay one end on the mastoid. I sound the fork and place the stem on the wood. If it is only vibration that he interprets as sound this procedure by minimizing it will practically exclude it. I am unaware that anyone has tried this means of bone conduction in deaf mutes. It occurred to me and has solved many cases.

If there is no fork heard, and the voice (if any) is non modulated, a lip reading education is advised.

I divide the cases of deafness into six types.

1. Absolute nerve deafness.

2. Clinical nerve deafness where there is practically no bone conduction and some air conduction.

3. Slight nerve deafness where there is plus R but bone conduction is diminished.

4. Absolute conduction deafness where there is no air conduction.

5. Clinical conduction deafness where there is minus R.

6. Slight conduction deafness where there is plus R, but air conduction is diminished.

The audiometer is next used and the distance noticed. If they hear it at arm's length they are sent back to the regular schools. It is surprising sometimes how far a child will hear the audiometer yet be handicapped for the voice. Wright's six feet rule is then used. The inability to hear whispered voice at six feet places the child in the handicapped deaf class. Children who come into the six feet rule had better begin lip reading education at once. Those with a slight disability are advised to have a front seat in the regular schools. Those that have catarrhal deafness or intermittent deafness are strongly advised to have constant treatment before they get into the minus R class.

If the figures of Doctor Amberg are true that 74% of deafness is due to preventable causes it shows the great necessity for aural supervision of children especially after the exanthemata.

The majority of the cases of deafness are not discovered by the doctor but by the teacher on the child's entrance into school. Valuable time is thus lost. A child came to me for examination whose family was deaf. The brothers had been placed in an institution and in course of time he was sent there also. After being there some time he did not like it and was taken out. I examined him and found that his hearing was perfect. There is only one explanation for this—a lack of proper aural examination in institutions, or a desire to increase the budget by increased attendance.

I think it is impracticable to follow the advice of Miss Adestine, who holds that the deaf child must be educated by daily contact with the normal child in order to give it a normal outlook after leaving school. While no one will dispute that aural training educates the brain and voice, and should be followed as much as possible, it is manifestly impossible to give the same training to deaf and to normal children at the same time. As Doctor Love states "The deaf child needs special training for ten or twelve years in small classes with special teachers."

The deaf are delinquent in the army, navy, medicine, law, music, school-teaching, telephone, railroad work, shorthand, telegraphy and type-writing. They are a class by themselves, and should be trained to get the normal intellectual results by lip reading.

The tendency to tuberculosis in deaf mutes because they do not talk and exercise their lungs should be a potent argument for their attaining speech. In the school they give gymnastic exercise, such as blowing soap bubbles to help the attainment of speech.

In a group of 336 cases I examined I found that the deafness occurred at birth in 140. Before five years of age 92. After five years, 63, so that we have 50% congenital deafness and 27% occurring before five years of age. There was only one who had malformed pinna. There were twice as many cases from measles as there were from scarlet fever. Seventy-six per cent of the cases are of foreign parentage, 11% are foreign born. Russia and Italy are the largest contributors. The parents of 314 children were asked two questions.

When was the deafness of the children first noticed?

Before the child was five years old	135
Over five years of age	28
Following severe illness	119
I following accident	10
Following removal of tonsils and adenoids	2
Following dose of chloroform	1
After entering school	17

How did the examiner happen to notice the deafness?

Child did not notice sounds as a bell, victrola, street organ, thunder, fire engines, voice	130
Child did not answer when spoken to	64
Child did not talk	35
Whatever was said had to be repeated	22
Always saying "what"	2
The doctor told the parent	28
The teacher told the parent	17
Deafness was discovered by relations and neighbors	2
Did not play with other children	2
Did not waken at a loud noise	1
Did not act like other children	2
Parent watched for deafness after earache	3
Deaf parents tested children	2

The eyes of the handicapped deaf child should be carefully examined. Out of the 314 children examined, 25, or 8%, had glasses prescribed and are wearing them. I rely naturally on the retinoscopic findings inasmuch as there is very little subjective help. I use sometimes the ordinary chart, but often a special chart made up of characters with which they are familiar. Their lip reading depends on their visual acuity, and their progress is dependent on good vision. In one group of 35 cases sent for eye examination, 20 were fitted with glasses. This shows the necessity of rigid ocular examination. There was nothing special about the ametropia of these deaf children and there was no correlation of the eyes and ears in the nerve deaf cases.

The "Pintner" intelligence tests are used to prognosticate the educational possibilities as

shown by these examples. One boy—a congenitally total deaf case—showed fine results as regards intelligence and educational ability. That boy is now in his senior year in one of our largest high schools—De Witt Clinton. He has held his own with hearing pupils. Another finished high school and four years in Stevens Technical Institute, and has a degree of Mechanical Engineer. Another came out second highest in a civil service examination for junior draftsman. In the two surveys of the school by the "Pintner" test the median mental percentage was 52, which means that the school as a whole is of normal mental ability. In 1923 the median educational percentage is 82. This median of 82 throws the school into the upper 25% of educational work accomplished by deaf children.

There is a great need of a reliable objective proof of nerve deafness in the very young. It was shown in the table given above how accidental was the discovery of the child's disability. We are confined to our tympanic examination and the response to sound. The tuning forks are of very little service. I thought I might get some information by the vestibular test, arguing that if there was cochlear impairment, there might be also vestibular. My deductions are not completed concerning this means of diagnosis of nerve deafness. In seventeen cases tried by the chair test five showed no vestibular reaction, and six showed a diminished reaction. One gave an exaggerated response, and five were perfectly normal. In about 30%, therefore, we will get no vestibular response. In 60% we will have none or a diminished reaction, so that in a suspected nerve deaf case if we use the chair test, we may get corroborative evidence of deafness.

## A GRIPPE EPIDEMIC AMONG CHILDREN

By MANSFIELD G. LEVY, M.D.

BUFFALO, N. Y.

**B**ECAUSE of the recent epidemic among children in Buffalo it seemed timely that a paper be prepared which would give insight into the condition or disease that was so widespread, so persistent, and accompanied by so many special features. It will be my aim to prove that the infection was not influenzal in nature, and also to discuss the subject from the bacteriological point of view, and to recite some of the special features as they were found to exist.

There can be no doubt of the identity of the influenza epidemics of 1889 and 1918. Both epidemiologically and clinically they are alike. The difficulty arises in attempting to place sporadic outbreaks and isolated cases of influenza under the same heading. There is a strong ten-

dency to classify some of the cases of nasopharyngitis with fever, some of the commoner types of acute bronchitis and some of the grippé cases under the one heading Influenza. In fact, the terms grippé and influenza have been so generally abused by the laity and especially by the profession as to constitute an annoyance in determining outbreaks of the true disease. In spite of this criticism, and for want of a better term, one cannot do otherwise than call this recent epidemic one of "grippé."

Cases showed many variations. They differed bacteriologically and pathologically. Many of these cases showed naso-pharyngeal signs, some showed laryngitis and trachitis and a few showed bronchial and pulmonic lesions. Hence arose the difficulty of classifying these cases from a

pathological point of view. We cannot classify them bacteriologically because multiple organisms were causative in the individual cases. Certainly we cannot call any of these cases influenza because the influenza bacillus has not been recovered in a single instance.

#### BACTERIOLOGY

As said before, there is no certainty that the influenza bacillus of Pfeiffer is the cause of influenza although a certain small percentage of cases do show its presence in the sputum. However in the recent "grippe" epidemic, the influenza bacillus was not found in a single instance where we were able to collect sputum or naso-pharyngeal washings and have them properly cultured.

Nor do any of the pathologists in town with a single exception admit of having recognized it. Further there was no specificity whatsoever during this epidemic. A number of different organisms were the misfactors. The most common offender of all perhaps was *micrococcus catarrhalis*—usually a very benign organism and most commonly found in secondary infections. Perhaps owing to its common causal relationship in this recent epidemic, we have the explanations for the mildness and moderation of many of the cases. The next most common offender was *streptococcus haemolyticus*. This bacterium was found in the cases of the greater severity and was much more commonly present than the pneumococcus. Other organisms of lesser importance also were found. Among these were the *streptococcus viridans*, the *staphylococcus albus*, the *micrococcus tetragineus* and still others.

Through the courtesy of Dr. Charles A. Bentz and Dr. Walter F. Zelnusky, the records of the local Health Department were made available to me. These records, peculiarly did not coincide with the findings in the cases collected at the Buffalo General Hospital, the Children's Hospital or in any of the cases of my private practice. Further there was no exact method of telling which cases belonged to the particular epidemic under discussion here. However, the reports do show the prevailing organism found in the sputum during the height of the epidemic. The pneumococcus was the chief offender, having been found in thirty cases, type 4 occurring in 85 per cent of these, and *streptococcus viridans* was found 26 times. *Streptococcus haemolyticus* was not found at all. *Micrococcus catarrhalis* was found but 18 times, influenza bacillus was found 5 times, *staphylococcus* was found 15 times, *micrococcus tetragineus* was found 4 times, the tubercle bacillus was found but once. Most commonly two or more of these organisms were present in the same sputum. It is difficult to explain why the findings in the sputums ex-

amined by the Health Department should differ from those examined by other pathologists unless it be due to the fact that the sputums examined by the Health Department were taken at random while the others were selected from cases suffering from the particular affliction under discussion.

#### SIGNS AND SYMPTOMS

Among children the onset was characteristically abrupt. It was commonly accompanied with vomiting and signs of so-called acidosis. There were chilly sensations, pains and aches were scattered through the body, generally myalgia but occasionally articular. Convulsions occurred only once in my experience and that was at the time of onset. Most of the cases showed signs of a pharyngitis, the throat being fiery red. More common than this, however, was the ever present laryngitis and tracheitis accompanied by substernal pain. There was some cough—dry and harsh. The temperature as a rule reached 101 or 102 degrees—rarely more than that. Usually there was a slow decline in normal during the course of three or four days. In a few cases after convalescence seemed definitely established, remissions of temperature occurred especially in patients who left bed too soon. Those cases complicated with pneumonia showed a moderate increase of fever after the preliminary infective period. The pulse as a rule coincided with the course of the temperature. Intestinal signs were few, although one or two cases in the wards of the Children's Hospital showed signs of an enteritis. There was no prostration ordinarily, and the tendency was toward prompt recovery in a few days without complications. In the more severe cases, which by the way were the ones caused by the *streptococcus haemolyticus*, there were rigors, excessive fever, nervous symptoms, and rarely prostration. A very few of these cases were fatal, death occurring in a few days from the toxemia or with signs and symptoms suggestive of extreme pulmonary engorgement and without clear indication of pneumonia. Fortunately, or unfortunately, none of these cases came to the post mortem table either at the Buffalo General Hospital or the Children's Hospital.

The blood findings were hardly what might have been expected. In the presence of an infection by any of the organisms known to be causative of this disease or condition one naturally would look for a leucocytosis of fair proportions. Here the white cells were so moderately increased that one might be tempted almost to call it a relative leucopenia. In the hope that I might increase the number of leucocytes I have given minute doses of quinine without effect, however. Even where pneumonias developed, the leucocytes were not increased in

proportion to the degree of infection or intoxication

As said before, these cases had a tendency to recover without complications. Middle ear infection, pulmonic involvement, or kidney complication certainly were not the rule, neither have I seen any cardiac complication. However I have wondered whether or not the very recent epidemic of mastoid disease might not be traced back to an original gripe attack with throat involvement that had occurred earlier in the winter. Also, one would naturally feel that where the pneumococcus was so commonly concerned, we would have many pneumonias. We feel that pneumonias were decidedly infrequent because the infections were usually mixed. In the few cases where pneumonia did develop, instead of finding the usual broncho-pneumonia,

so common in children, we have found the lobar type of involvement.

#### CONCLUSIONS

1 The recent epidemic was not influenzal in nature.

2 The prevailing organisms were the micrococcus catarrhalis, the streptococcus hæmolyticus, the streptococcus veridens, and pneumococcus.

3 The striking features of the epidemic were the abrupt onset, the laryngitis and the trachitis, the relative leucopenia and the lack of complications involving the middle ear, the lung, the kidney, and the heart.

I wish to express my indebtedness to Dr. Harry R. Lohnes, Dr. Dewitt Sherman, and Dr. Hauenstein of the Buffalo General Hospital, for their valuable aid and co-operation in this work.

### HYPERTHYROIDIA

WILLIAM H. HAY, M.D.

BUFFALO, N. Y.

This condition has been markedly on the increase in the past half century, and has been considered a very unmanageable condition, generally.

Reason has been assigned for this disease that does not appeal to the writer as based on sound logic, and while he is willing to admit that one reason may be a paucity of iodine yet this seems extremely unlikely, as the element is of rather wide distribution in the ordinary foods, and to escape a bankruptcy of this it is only necessary to eat rather freely of the greens or fruits, or both.

Ordinary cabbage contains much more than a sufficiency of this ingredient of the thyroid gland, and almost everyone eats cabbage measurably, or sauerkraut raw or cooked, which if eaten once or twice a week would supply any possible deficiency of iodine.

Green beans are fairly high in iodine, as are also pineapple and several varieties of the fruits, while a number of varieties of fish supply an excess of iodine.

The amount of iodine in the system is considerable, described by all analysts as a "trace," though it is true that this is found in higher percentage in the thyroid gland than in other parts of the body.

This seems to dispose of the fact that iodine is needed from other sources than foods, but in fact it does not, for foods that are cooked may

be deprived of their iodine, largely, by this process, so to make sure that there is no paucity from this source it is quite necessary that some foods containing appreciable amounts of iodine should be eaten raw, if not once a day, then surely two or three times a week.

There is no evidence that inorganic iodine taken into the body is ever assimilated, in fact its noticeable excretion by the mucous membranes is pretty good presumptive evidence that it is not acceptable in inorganic form to the tissues, so all thought of supplying possible iodine deficiencies artificially is probably a wasted thought, nature having her own way of elaborating chemicals in plant life and thus rendering them suitable for introduction into the body.

Seventeen years ago the writer was impressed by the noticeably toxic condition of hyperthyroids and proceeding on this tip he de-toxicated thoroughly and deeply every case that presented for treatment, with the most gratifying results, and since that time he has neither referred such cases to the surgeon nor has he taken a pessimistic view of prognosis.

De-toxication was carried to the point of severe purging, daily enemata of cool water, sweats, and entire abstention from all foods for as much as three days, occasionally prolonging the initial fast to several days, even two weeks in severe cases, without fear of harm, the gradual amelioration of the most urgent symptoms giv-

ing fairly correct evidence of improvement as the fast progressed

Diet following this period of initial fasting and purging with simple salines was limited to soups made without a meat stock, salads of all sorts of greens rich in iodine and dressed always without vinegar, but using lemon juice freely, and to fruits of all sorts especially those of the citric group

Later vegetables baked or steamed were added, and finally breads and cereals but only those representing all the elements of the grain, not denatured or processed in any way beyond a grinding

Meat eggs, fish and cheese were withheld for several weeks or months depending on the depth of the intoxication, and caution was exercised in the free use of any of these foods afterward in order to lower the nitrogen index which is always high in toxic states

Patients after complete recovery are allowed to eat one protein meal per day but forbidden to combine this with starches, thus avoiding the ambiguity of digestion at one time of two food substances that require diametrically opposite conditions for their perfect performance. Also the starches were separated from both the proteins and the acids, for the same reason, to continue an alkaline digestion as long as possible after the ingestion of a carbohydrate meal

To date there has not been one case in the seventeen years that has not fallen easily under this classification, every case being treated as an intoxication pure and simple and so far every case has either fully recovered or is progressively better with each year of life

Among the cases treated was one that had been declined operation by Dr George W. Crile, of Cleveland

This was an extremely bad case, with heart rate uncountable, the action most tumultuous dyspnea marked, emaciation and discoloration of the skin some edema of the feet, inability to walk or lie down, reclining in bed being the only position in which respiration was possible. Exophthalmos was hideously prominent while digestion was almost entirely absent

This case fasted for two weeks following three days of free saline purgation followed by daily cool three- quart enema, to fully unload the colon

Improvement was progressive from the first day the dyspnea subsiding noticeably the tremor diminishing and sleep in the almost flat position being very refreshing

In three weeks the exophthalmos was noticeably less, and the heart rate was regular, though still above 100 per minute

At the end of four weeks she was able to return home in the tram, in three months resumed her household duties, and two years later reported herself entirely recovered

It has now been eight years since her treatment was begun and she reports herself unusually well at all times, with no elevation of pulse rate no nervousness, no indigestion, and no constipation

Another case was admitted for treatment at the end of the second month of pregnancy, which was not suspected till two weeks later, when examination disclosed a gravid uterus

After three weeks of almost daily threatened miscarriage she made a full and complete recovery carried her baby to full term without incident experienced a normal accouchement with normal lying-in period, normal and sufficient lactation for seven months, without a return of her trouble, and reports herself and baby, after four years as in perfect health

Numerous cases occurred in girls of the early twenties who are in some cases married and raising families, and who report no return of any of the distressing symptoms of hyperthyroidism

It was assumed that all of these cases suffered from an acidosis, even though this was not always demonstrable, and simple detoxication, without drugs of any kind beyond the saline purge was sufficient to remove the urgency of the symptoms in each case, and this followed by an atoxic diet was all that remained to complete a recovery

All negative proof, you will think, and this is true, but until at least one case occurs in the writer's experience to cast doubt on his assumption that a basic toxemia is the real cause of this condition I am sure he is to be pardoned for both his assumption in believing something that is not generally thought to be true and his optimistic prognoses

If the condition is as simple as this experience would seem to indicate we are surely on the wrong track when we seek to limit thyroid activity by ligation of the arterial circulation or resection of one or more lobes of the gland, for clearly this is not a curative procedure, the cause of this hyperactivity being extraneous to the gland a systemic infection

While it is true that ligation and resection do improve the state of the patient this is seldom permanent as all will admit, further resection or ligation being generally necessary later on

It would seem then to be the sensible course to first de-toxicate deeply and thoroughly, and by an arrangement of the food to guard against the future production of toxins that can again irritate the gland to a state of hyperactivity

## TREATMENT OF THE SACRO-COCCYGEAL SINUS \* (Pilonidal Sinus)

By MILTON R. BOOKMAN, M D  
NEW YORK CITY

**A**S the name adequately implies, sacro-coccygeal sinuses are found over the sacro-coccygeal region, and are the result of suppuration or breaking down of a sacro-coccygeal cyst

The sacro-coccygeal cyst, or forerunner of the sinus, is the result of the malplacement of groups of dermal or dermoid cells in the embryo which are lost so to speak during the process of fusion in the midline, and take up their functions in an abnormal location beneath the skin. The result of these perverted activities is an accumulation of detritus and secretions of the skin appendages (sweat and sebaceous glands), and the very gradual formation of a cyst, which often contains hair. This latter fact explains the name "pilonidal cyst" often applied to this condition. More rarely other structures such as teeth or particles of bone are found, but these abnormalities come under the classification of true dermoids.

The history as given by the patient is usually as follows. After a slight trauma or a few days of sensitiveness over the lower part of the sacral region, a tender swelling is noticed. This either ruptures spontaneously or is opened surgically as was any superficial abscess would be.

After repeated dressings the wound closes down to a small sinus which obstinately refuses to heal despite all forms of treatment, including cauterization and curetting, the latter often productive of exhibiting a hair or two. A probe passed into the sinus always advances toward the median line though the orifice may be an inch or more from it. Usually there is but one opening, but in a recent case two distinct tracts were made out which led to the former cyst cavity.

In a fair proportion of cases there will be found in the skin over the coccyx a number of minute openings which resemble large pores and which will not admit even a fine probe. These are the external orifices of fine canals that have their internal ends intimately connected with the old cyst. Unless they are completely removed at operation, they remain a fruitful source for a recurrence.

Treatment is by operation. General anesthesia is the anesthesia of choice, local or sacral injections in an area known to be infected is not ideal. The sinus is emptied by pressure, and through a usual local preparation the orifice is centaged in the by a subcutaneous suture, the tip of the body previously filled with a dye in solution.

This seems to displace the opening and the suture is needed from other sources. ethylm blue 5% is the fact it does not, for foods. This is injected increasing pressure

aided by light finger massage over the entire region so as to have the color reach all the ramifications of the tract. The suture surrounding the opening is then cut out and the excess stain mopped up.

The opening is then entered with a grooved director which is pushed as far as it will go, and the tract is slit open with a scalpel. This may reveal a tuft of hair at the bottom of the incision or in the velvety blue stained tract. Beginning at the top or skin margin and working into the depths of the wound, keeping well outside the blue stained fibrous tract wall, the entire sinus is easily excised with the scalpel. The same procedure is carried on to remove the other half of the sinus on the opposite wall of the primary incision. The dissection often leads one down to the ligaments covering the sacro-coccygeal articulation, and in order to preclude the possibility of a recurrence, all blue stained tissue should be removed.

After the main tract has been removed, on inspecting the sides of the primary incision, one or more blue spots may be seen, these are the openings on cross section of branched sinuses, and by splitting them the tracts are easily ablated by "following the blue line." At the lower end of the wound if the before-mentioned large pores are present the incision should be extended so as to reach beyond the lowest one. This may reveal very fine lines of blue extending from the skin to the vicinity of the former cyst, and unless the tissue bearing these fine canals is completely removed, a recurrence is more than likely to occur.

As the wound must be considered an infected one and is very close to the anus, suture is contra-indicated. The best treatment is carefully layering of packing gauze in the wound in such a fashion that the depth of the wound is loosely filled and as the wound grows smaller, or as the patient moves about in early convalescence the superficial layers of gauze are extruded and are cut off at the daily dressing. In this way painful repacking is avoided.

With the removal of the last of the original packing, the wound is filled with balsam of Peru in castor oil 10% and lightly tamped with gauze, the skin edges being kept apart and allowed to close last. A strip of adhesive plaster is placed across the buttocks to hold the dressing in place, and a "T" binder placed over all makes a comfortable means of retaining things in place.

The patient may be allowed to walk about as soon as he has the inclination to do so. The subsequent dressings are made daily for a time and later the intervals between them are lengthened until skin-healing is complete.

## THE PROPOSED MEDICAL PRACTICE ACT

We invite the studios attention of every member of the State Society to the editorial of the executive editor describing the Act to amend the Public Health Law in relation to the Practice of Medicine, and to the Act itself which we are printing in this issue.

A stronger Medical Practice Act has long been desired with stronger rules for enforcement, the necessity of protecting our citizens from the banditry, and criminality, and ignorance of quacks within and without the licensed medical profession is acutely felt, and while it is manifestly unfair that the expenses of such protection should fall upon so small a proportion of the taxpayers as is represented by the physicians of the State, nevertheless we presume that a majority of us are willing to carry the burden if, by so doing, we may achieve the greatly desired result.

We are not encouraged by the fact that however we may strain our eyes and ears we have never been able to learn what becomes of the three dollars we annually pay for the privilege of prescribing opiates for the sufferers who need

them, and we cannot be enthusiastic about the surplus, above the expenses of collection, of the two dollar registration fee, which is to pay the expenses of administering this new medical practice act, because we feel that it will be an entirely inadequate sum.

The fact that there is a precedent for the various professions paying for the protection of the public, by registration fees which furnish a surplus income to the Department of Education, does not make it right or necessary for the Medical Profession to follow the precedent. We are entirely in favor of a registration, and of a fee sufficient to pay the expense of it, but we are strongly against assessing a small group of taxpayers, to pay for prosecutions which are for the benefit of the millions of the citizens of the State.

It seems perfectly right that the Attorney General's office should conduct such prosecutions, thus removing the cases from local influences, but the fact that this work is necessary, for the safety of the public health is no more the re-

sponsibility of the physicians alone than was the fifty million dollar bond issue to develop the State Hospitals

We wonder how many doctors will patiently stand the penalties for accidental failure to register on time. We should even be sympathetic with a doctor who should be so stupid as to think that he might stand upon the rights conferred upon him by the first registration, and refuse to do it again. We are entirely in favor of purging our list of physicians as now published in our Directory, of abortionists and other violators of the Medical Practice Act, and of putting them

forever where criminals should be, but we are against punishing any honest physician for the crime of forgetfulness

With these exceptions we heartily favor the proposed act. The definite stand against the quack is well taken and, if properly enforced, will improve our situation greatly

We would like to hear from every reader of this JOURNAL giving his opinion of this measure. We could not publish every letter but we would be glad to tabulate the opinions

We urge careful consideration of this act which carries so great potentialities N B V E

## THE PRACTICE OF MEDICINE ACT

We are printing the proposed Medical Practice Act on page 214 of this JOURNAL. It has been introduced in the Legislature as a Department of Education measure, and has the approval of the leaders of the Medical Society of the State of New York, and of the State Department of Health. The bill has been carefully considered by Mr. George W. Whiteside, the Counsel for the Medical Society, and he and the other leaders of the Medical Society approve it *in its present form*. If the bill becomes changed on its way through the Legislature, due notice of the changes will be made in this JOURNAL, and the attitude of the leaders of the Society toward the changes will be indicated. It is designed to provide the machinery for regulating the practice of medicine in New York State. The great weakness of the Medical Practice Law has been that it failed to place the responsibility for its enforcement upon any official or department. The result has been the same as the control of diphtheria would be if the health officers were not charged with the duty of both discovering and controlling cases of the disease.

The Medical Practice Act which we are printing is an amendment to Article 8 of the Public Health Law.

Article 8 is entitled "Practice of Medicine," and consists of fifteen sections numbered 160 to 174, inclusive. The present act amends sections 170 to 174 inclusive, and leaves intact sections 160 to 169.

An essential part of the Medical Practice Act is Section 160, entitled "Definitions." Subdivision of that section defines the practice of medicine as follows:

"A person practices medicine within the meaning of this article, except as hereinafter stated, who holds himself out as being able to diagnose, treat, operate, or prescribe for any human disease, pain, injury, deformity or physical condition, and who shall either offer or undertake by any means or method, to diagnose, treat, operate or prescribe for any human disease, pain, injury, deformity or physical condition."

This definition of the practice of medicine is

sufficiently broad and clear to include the practice of all the common cults, including chiropractic. This definition has been on the statute books since 1907. It has been a dead letter because physicians have been the only persons who had any interest in the enforcement of the act, and when now and then a physician gave information against an illegal practitioner his complaint was vitiated by his apparent self-interest in the prosecution.

Section 161 of the Practice of Medicine Law sets forth moral qualifications of a candidate for medical practice.

Sections 162 to 165 give the organization powers and duties of the State Board of Medical Examiners.

Sections 166 to 169 inclusive give the educational qualifications that are required for admission to the State examinations for licensing physicians, and the procedure for conducting the examinations and issuing licenses to practice medicine.

All these sections of the law are satisfactory in their present form, and no change in them is suggested.

The new law starts with Section 170. It omits the entire present Section 170, and repeals Section 171. These two sections provided for registration in each county in which the physician intends to practice, and for the revocations of licenses and the annulment of registry. In its place it substitutes a registration, and this registration will permit the physician to practice medicine anywhere in New York State.

Section 172 is on legal evidence. It is renumbered 171, and remains as at present.

Section 173 of the present law, entitled "Construction of this Article," is renumbered 172 in the proposed law and remains as it is at present, except for the insertion of a short paragraph permitting the use of the title *doctor* by those holding academic degrees.

Section 174 of the present law becomes Section 173 and is entitled *Penalties*. All the present

matter in the section is omitted, and new procedures are prescribed by the proposed law. Section 173 of the new law provides the prosecuting machinery to which reference was made in the beginning of this article. It provides that a violation of the article shall constitute a misdemeanor which may be tried in courts of special sessions without a preliminary indictment, and that such misdemeanors shall be prosecuted by the District Attorney, and that the State Attorney General may supersede the district attorney without further authority or direction. It further provides that the Regents shall investigate complaints against alleged illegal practitioners and may appoint inspectors who shall gather evidence on which to base the prosecutions.

The proposed law adds a section to be known as section 174. This section is on subjects which were contained in section 170 of the present law, and relates to the revocation of certificates and the annulment of registrations.

It is proposed that the new provisions of the law take effect on July 1, 1924.

Anyone who compares the proposed law with the present one will be struck with the completeness of the new provisions and with their adequacy to cope with the illegal practice of medicine. Physicians have long been demanding the passage of a law that shall embody the broad general provisions of the one which is now proposed. They object to only one provision—that of re-registration. It is unwise to call the bill the registration bill. The reasons for the provision of re-registration are clear and cogent. The duty of prosecuting illegal practitioners is placed upon the Regents. The first thing for the Regents to do is to secure a complete list of the legally registered doctors of New York State. This they can do by various means such as a canvass by the police, or a certification by medical societies of the counties or State. These methods are burdensome and inexact, and the simplest method is that of having each physician do his part and register himself personally. It would be a calamity if the annoyance which the physicians feel should lead them to oppose the bill.

F O

### FREELY WE HAVE RECEIVED, FREELY GIVE

Generous has been the response to the appeal for funds made by the physicians in Germany to their *confrères* in America.

Largely and repeatedly have money, clothing and food been contributed for the starving children of unhappy Deutschland, through the medium of the Red Cross Association, and the American Committee of Relief of German Children, and other organizations of devoted philanthropic people.

At this moment General B. G. Dawes, Owen D. Young and Henry M. Robinson are sitting in Germany as committee charged with the duty of ascertaining Germany's resources and financial possibilities, and of proposing a scheme of reparations commensurate with her real ability to pay, present and future. This American Committee is performing an altogether altruistic labor—a contribution to the adjustment of world difficulties, and an earnest endeavor to assist, as far as in us lies, in the prevention of further uncertainty, suffering and anguish of many of the peoples of Europe, which were debilitated and distressed by the great World War.

At this time the German Government is seeking to float a large loan in the United States to assist it in prolonging its very life and in generally rehabilitating its practically bankrupt country. Hardly anywhere else in the world can Germany borrow any money.

With all these facts at hand showing to what extremity Germany has sunk, and its imperative

need for a helping hand, it seems incredible to American physicians that the members of the medical faculty of the former German Empire should take the position they do, back of their government, in refusing to make known the composition of the announced new remedy for the veritable sleeping sickness of tropical Africa, or *trypanosomiasis*.

It is stated that researches incident to the dye industry in Germany revealed the properties of a new compound which is fatal to the parasite mentioned, when ingested by the affected human being. It is further stated that the Government of Great Britain provided a detail of physicians with complete facilities for testing this new remedy and that they reported it as efficacious and valuable.

Whereupon Germany refuses to do the ethical and altruistic and usual medical act in making known to the medical world the composition of this new remedy, except for a price. It demands that its former African colonies, lost by it very properly during the World War be restored to it as a condition of divulging the facts concerning this medicament, otherwise it will keep its secret.

If the physicians of Germany continue to endorse this offer of a dicker, and remain a party to it, they will deserve to forfeit much consideration by their American *confrères*, and much of their present claim of a frank scientific attitude.

"Freely ye have received, freely give."

# LEGAL

BY GEORGE W. WHITESIDE

## PROPOSED AMENDMENTS TO THE MEDICAL PRACTICE ACT

The condition of the public mind on quackery at this time augurs well for the passage of legislation against the quack. There is more public interest evidenced through the lay press on this subject than has been seen in many years and considerable publicity has already been given to proposals to remedy admittedly bad conditions in this state.

The bill now pending before the legislature and sponsored by the Department of Education contains many new features upon which the profession should be informed that it may take a position as leaders in the movement for reform.

*The Present Law*—From time to time the educational requirements of an applicant for a license to practice medicine have been raised by statute so that this state is commonly regarded as maintaining a high standard of medical licensure. The provisions for registration of physicians have not been materially changed in forty-three years and the penalties against unlicensed practitioners and the machinery for enforcing such penalties have been unchanged for sixteen years. The registration law now requires each physician to register in the County Clerk's Office of the county in which he practices and throughout the state the County Clerk's offices contain the names of thousands of physicians who during that time were licensed and registered. Many of these physicians are dead or have removed from the state so that there is not any authentic or accurate official census of physicians in this state. The method of prosecution against unlicensed practitioners that has been in force for sixteen years past has been but little utilized throughout the state and where it has been invoked the results have been far from satisfactory. The authorities have become accustomed to look to the County Medical Societies to take the initiative in the enforcement of the Medical Practice Act in that under the law they are specifically mentioned as authorized to undertake prosecutions and are permitted to receive the fines resulting from prosecutions to defray the expense incident to such cases. This system has given an unfortunate aspect to the enforcement of the law, in that this means of enforcement for the general good has been misinterpreted as prompted by selfish motives on the part of the profession. Color has been given to this mistaken view by the fact that a medical society acting as complainant has a financial interest in the ultimate result of the case in the collection of such fines as may be imposed. Furthermore,

this system of enforcement has imposed upon the organized medical profession the exercise of police powers which have been not only in part misunderstood by the public but have resulted in imposing a burden upon the organized profession for which it is not adequately equipped to finance or discharge.

There has not been any centralized department of the state government charged with the duty of enforcement, nor any provision for the appointment of inspectors to discover and bring to justice unlicensed practitioners. These defects in the present law undoubtedly account in part for the notoriously bad condition now existing throughout the state due to the practice of medicine by unlicensed and unqualified practitioners under practical immunity from the penalties of the law.

*Proposed Changes*—The proposed amendments seek to correct these defects with a view of ridding the state of the unlicensed practitioner and of providing means of reaching likewise the licensed man who by his fraudulent or unlawful practice brings odium upon the profession.

*Registration*—Under the law now in force providing for registration in the County Clerk's Office the status of the physician's license is not affected by the provisions requiring registration. His right to practice in a given county is predicated upon his license and his registration in that county. This in effect restricts a physician to the practice of medicine in one county, his work in other counties being practically confined to consultation work or the visitation of patients. There is no way, therefore, that the authorities of one county can quickly ascertain if a physician visiting patients or holding consultations in such county is in fact a licensed physician if his office is in another county, unless indeed the authorities investigate the records of the County Clerk's Office of the county wherein the physician has his office, and then there would be no certainty as to the identity of the particular physician should his name be found on the County Clerk's list, as he might well be practicing under the diploma of a duly registered physician who had died. Furthermore, these County Clerks' lists are now cluttered with the names of thousands of licensed men who have died or moved away, and in order to be absolutely certain that the name appears on the list one would have to examine the entire list from the year 1880 to date.

It is proposed in the amended act to do away with the restriction confining a practitioner to

one county and to give to his license, which is in effect state-wide, truly state-wide application so that he may be permitted to practice throughout the state, and to substitute for the registration in the County Clerk's Office a registration with the Board of Medical Examiners under the regents at Albany.

In order that this registration may be kept up-to-date it is required that a physician register annually but that this should be done with as little inconvenience as possible to the profession after the first registration and to this end the secretaries of county medical societies are given authority to aid in the registration by using the machinery of their offices. The registration subsequent to the first therefore, practically amounts simply to a report of the name and address of the practitioner so as to show that he is still engaged in practicing medicine.

The list of authorized practitioners is to be published annually in January and furnished to every licensed practitioner with the request that he report the name of any person that he knows to be practicing whose name does not appear in the list to the secretary of the Board of Medical Examiners and also to the secretary of the County or State Medical Society without assuming responsibility of prosecution. In this way the regents will be informed of the activities of unlicensed practitioners and the medical societies will have the information so that they can follow up the matter with the authorities and see that action is taken. Instead of the county societies instituting prosecutions, all prosecutions will be instituted by the Board of Regents although anyone may upon his own information bring a prosecution. The Board of Regents are empowered to appoint inspectors to discover violations and to bring about prosecution of the violators. The appointment of assistant attorneys general is provided to enforce the act.

In order that the profession should not be permanently committed to the necessity of annual registration, the act provides that registration shall be required for only five successive years. It is intended by this means to regard this five-year period as a trial period during which the profession will ascertain the degree of efficiency shown by the regents and the Attorney General in the enforcement of the act with a view of determining at the end of that time whether it would be wise to extend the principle of registration for a further period or not.

The principle that exists in the present law, whereby a license once granted is regarded as good for the life of the licensee unless revoked for cause, is continued in the proposed act and the provisions requiring registration are not permitted to have any effect whatsoever upon the status of a man's license. Failure to register under the act subjects one to a small additional

fee and willful refusal to register is punishable only by the imposition of a fine and it is specifically provided that under no circumstances shall there be any other penalty imposed so as to prevent the registration act being used as a weapon for the revocation, suspension or jeopardy of a man's license.

It can be readily seen that the enforcement of this act as outlined above will entail considerable expenditures of money which should be appropriated from the public treasury. Those who have long and practical experience in the operation of laws particularly governing the professions speak with considerable authority that such appropriations are as a matter of practice quite impossible to obtain and that should the enforcement of the act be dependent upon such appropriations such enforcement would probably break down through lack of appropriations and the act become a dead letter. This is decidedly an unfortunate condition of affairs and one to be deplored, but nevertheless one to be reckoned with. It has, therefore, been provided by the sponsors of the act that a license fee for registration of two dollars per year be imposed upon the physician and that this fee, together with such fees and penalties as may be collected in the enforcement of the act against unlicensed practitioners should be used in the enforcement of the Medical Practice Act. Were one to attempt to sustain the imposition of this fee taxation or assessment or whatever one may wish to call it on the grounds of principle one would be met at the very threshold of his attempt with insuperable difficulty. It is not a practice supported by principle but nevertheless apparently justified by precedent. The other professions other than the profession of the law, are assessed in this way for the enforcement of the acts under which their licenses are granted. It is not our purpose to make any plea in support of this practice but to endeavor dispassionately to explain the circumstances under which it has been proposed with the view of having the profession understand and appreciate the underlying reasons prompting it, so that they may weigh with the disadvantages of the system the claimed advantages in the other provisions of the act.

Many physicians may say why should the medical profession be taxed to enforce the law when the law profession is not taxed to enforce the law applicable to the practice of law. With as much reason one may say why should the dentists be taxed and the medical profession not taxed. Then again the legal profession has an entirely different situation to deal with. In the County of New York in this state there are two recognized law associations one the Bar Association the other the New York County Lawyers' Association. In the former the annual dues are seventy-five dollars, in the latter ten dollars, a

total of eighty-five dollars a year in dues alone to these professional associations. Both of these associations have committees on the unlawful practice of the law and grievance committees. Last year the Bar Association through its grievance committee disbarred or disciplined numerous lawyers and in addition heard upwards of a thousand complaints from litigants against lawyers, and spent upwards of sixteen thousand dollars in the performance of their work. In this way the legal profession has in effect taxed itself to enforce the law against its own members who debase the profession and against those who seek to encroach upon its prerogatives. Similar action is taken by many of the bar associations of the different counties throughout the state and substantial dues are paid by the lawyers in those counties to carry on this and other work. The medical profession has never on such scale engaged in this class of disciplinary work, either of its own members or of the unlicensed practitioners, or spent a small fraction of the amount which the legal profession have spent to maintain that profession against the inroads of shysters and unlicensed practitioners.

Under the proposed act, the total amount of the fees under the registration would be ten dollars for the five-year period. The question to be determined by the profession is, are they ready to spend this amount in this way and do they consider the general end sought to be accomplished by the other provisions of the act worth the sacrifice which the annual registration fee system entails?

**Penalties**—The amendments add to the present penalty of a misdemeanor for the violation of the act a civil penalty of one hundred dollars for each violation and provide that this penalty may be recovered by the Attorney General in a suitable action and every day's violation constitutes a separate violation for which the penalty may be imposed. This is a material increase in the penalties provided under the present law and furthermore the prosecution as misdemeanors of violations while in the hands of the District Attorney, as is now the case, may be undertaken by the Attorney General at any time should he find it necessary in his judgment, to supersede the District Attorney in a case. This provision should stimulate district attorneys who otherwise would be indifferent to the prosecution of these offenses.

The definition of offenses as contained in the present act is continued and in addition there is a strong prohibition against the use of the title "Doctor" by anyone who is not authorized by law to use it. Enforcement of this provision should bring down many chiropractic signs and blot out many newspaper advertisements of members of that cult. The misuse of the title "Doctor" in the past has been notorious and flagrant. There should be no excuse for this abuse

continuing under the amended act. The prosecution of all offenses under the act is made much simpler by giving jurisdiction to Special Sessions courts, which means that indictment by Grand Jury is unnecessary and a prompt summary trial can be had. In the Greater City this would mean trial without a jury. A new rule of law is provided whereby a person who displays a sign or an advertisement as a practitioner of medicine is presumed to be responsible for the sign or advertisement without further proof being offered to connect him therewith. This makes much simpler the eradication of these signs and advertisements and the restoring of the title of "Doctor" to its time-honored respect in the community.

**Revocation of Licenses**—The present provisions are in substance continued with slight modifications looking to simplicity. The present provision which gives the right to the regents to revoke a license of a practitioner who is guilty of a misdemeanor is repealed in that under this provision a practitioner might be convicted of a misdemeanor involving no moral turpitude and based upon some technical violation of the statute and have such conviction made the basis for attacks upon his license. Additional protection has been accorded the registered physician in this respect by providing that only conviction of crime involving moral turpitude other than conviction of a felony should be ground for revocation and then only after due trial. A new section, however, has been added as a ground for revocation and that deals with fraudulent advertising by physicians and this section should be welcomed by the ethical practitioners. Any physician under this section who is guilty of untrue, fraudulent, misleading or deceptive advertising or advertising cures for incurable diseases or secret methods of treatment or treatments or operations by means that he will not divulge may have his license revoked or suspended after trial. An additional safeguard is given to the physician, however, by providing a direct appeal by means of certiorari to the Appellate Division so that the judgment by which his license has been suspended or revoked may be reviewed. This same procedure is likewise provided for any physician who is aggrieved by any action of a disciplinary character that may be taken by the regents or who has been denied registration. It is the purpose of these provisions not only to provide adequate means for the disciplining of licensed physicians who bring disgrace upon the profession but to throw about every licensed physician adequate safeguards and protection against injustice or discrimination.

#### Conclusion

It has been our purpose in this discussion to present the various features of the proposed amendments without prejudice. There are in-

doubtedly many provisions of the amendments the benefit of which the profession would be unfortunate in losing. Are there insurmountable objections which would outweigh these benefits? On many points there does not seem room for much honest difference of opinion. On the registration feature judgments may differ. The profession as a whole should be heard on these proposed amendments and its ultimate judgment prevail. Material changes in the bill by way of amendment that seriously affect the vital principles of the bill or increase its burdens to the

profession might justify active opposition. If the bill is considered by the legislature as it has been introduced it would appear to be incumbent upon the profession to take a definite stand in favor of, or in opposition to its provisions. We conceive it as no part of our duty to attempt in the slightest degree to influence the policy of the society in this discussion and have endeavored purely to present the various features of the bill in the hope that the views here expressed may be of some value in the formation of a proper judgment of its value. ### DIABETIC GANGRENE WITH RESULTANT OPERATIONS

The defendant in this case was an attending physician at the clinic of one of our hospitals devoting a few hours several days a week to the gratuitous treatment of patients at the clinic.

The plaintiff, a waiter by occupation, had been a sufferer from diabetes for some period of time and had been a bed patient at the hospital for such condition. Under the hospital treatment he improved so that he became an ambulatory patient at the clinic. Among other patients at the clinic, he was seen and treated by the defendant at various times. He continued to receive treatment at the clinic for about seven months. His diabetic condition progressed to a gangrenous condition causing a dry sloughing of the great toe of the right foot. He was advised to have the toe amputated and finally consented to such operation, which was performed by one of the visiting surgeons at the clinic and not by the defendant. After the amputation of the toe, except

for one or two visits he ceased coming to the particular clinic for treatment.

Suit was subsequently instituted against this physician it being claimed that this defendant had performed the operation for the amputation of the plaintiff's toe and that because of his negligence in so doing a septic condition was set up in the plaintiff which grew progressively worse, requiring subsequent operations for the removal of the plaintiff's right leg and part of his left leg.

The action was not very strenuously pressed by the plaintiff's attorney and did not finally reach a place on the calendar for trial until almost four years after the action had been instituted, then the plaintiff's attorney realizing that there was no merit to his cause of action sought by every means to procure a settlement and when he found his efforts were of no avail and that in order to recover he would have to try the action, he then abandoned it consenting to a discontinuance.

# LEGISLATION

By James N Vander Veer, M.D

The Legislative Bureau is in receipt of a letter from the Executive Secretary, Bureau of Legal Medicine and Legislation of the American Medical Association which he believes should be published to the members of the Medical Society of the State of New York, that they may read of the efforts being made to free physicians of the unjust over-taxation now imposed as to the Harrison Narcotic Law.

The letter makes mention of the fact of the many complaints received from the profession relative to the ruling that requires physicians to pay income taxes on amounts expended for professional purposes in many ways

Physicians of this State would do well to write to the gentlemen whose names are mentioned in the letter in order that we might set before our representatives in Congress who are on the Ways and Means Committee our views upon the subject

"The Committee on Ways and Means of the House of Representatives has decided to act unfavorably on our appeal for relief from the occupation tax imposed on the physician under the Harrison Narcotic Act"

"A tax is necessary if that act is to be valid. The amount originally fixed, however, one dollar a year, amply insured its validity. The excess of the present tax is a burden discriminating against the medical profession simply to swell the federal revenues

No complaint was made when that burden was imposed, the Government needed the money. The Government, however, no longer needs it, and judging from published reports the Committee on Ways and Means is about to recommend slashes on tax rates generally, covering a wide field. There is no discoverable reason why the Committee should not recommend a reduction of this tax on the medical profession"

"On the Committee named are Hon Frank Crowther, of Schenectady, New York, and Hon Ogden L. Mills and Hon John F. Carew of New York City, New York. Will you not write to them about this matter, or have some responsible laymen known to them whose opinion they are likely to respect do so? It should be made clear that the medical profession knows that this excessive tax is unnecessary, regards it as unjustly discriminating against the physician, and is inclined to resent it"

"Attention might be called, too, to the complaints of the profession relative to the ruling that requires it to pay income taxes on amounts expended for professional purposes, namely, for travelling expenses incident to attendance on medical meetings and to postgraduate study"

"A letter addressed to the Committee on Ways and Means, November 23, 1923, shows the form in which the matter was presented to that Committee. The matter was discussed with Hon Wm R. Green, Chairman of the Committee on Ways and Means, before that Committee acted, who was hopeful of a favorable reaction. It was somewhat disappointing, therefore, when the present situation was revealed"

Accompanying this letter was a memorandum of compilation of arguments which were sent to the Acting Chairman of the Committee on Ways and Means, House of Representatives, last November, a digest of which is given that physicians may acquaint themselves and take action individually thereon if they wish to make any headway in the relief from taxes imposed

AMERICAN MEDICAL ASSOCIATION

Bureau of Legal Medicine and Legislation

William C Woodward, M.D., LL.M.,  
Executive Secretary

535 North Dearborn Street, Chicago,

November 23, 1923

Hon William R. Green,  
Acting Chairman, Committee on Ways and Means,  
House of Representatives,  
Washington, D. C.

SIR

Under date of March 23, 1923, I called your attention to the complaint made by physicians, of certain burdens imposed on them under the federal revenue laws. Two complaints were then referred to

(1) That the tax imposed on physicians under the Harrison Narcotic Act exceeds the amount necessary to give the Federal Government jurisdiction over physicians, under the Law, that to the extent of such excess it is merely an occupation tax imposed on the medical profession, and that in so far as the tax is subject to the preceding criticisms it is an illogical and unjust tax

(2) That the federal income tax law, as interpreted by the Commissioner of Internal Revenue, illogically and unjustly discriminates against the physician, in that it denies him the right of deducting as an ordinary and necessary expense of his profession expenses incurred in attending medical meetings

Since my letter was written, my attention has been called to a third source of complaint, namely

(3) That the federal income tax law, as interpreted by the Commissioner of Internal Revenue, illogically and unjustly discriminates against the physician in that it denies him the right of deducting as an ordinary and necessary expense of his profession the expense of postgraduate study

I note now that the Honorable Secretary of the Treasury has submitted to the Committee on Ways and Means the eliminating of certain miscellaneous taxes, and I am led, therefore, to urge again that the complaints of the medical profession of tax burdens illogically and unjustly imposed on it be carefully considered and that such burdens be removed

*Harrison Narcotic Act* The Secretary's suggestion that the miscellaneous taxes referred to be eliminated is on its face based on the fact that they "are a source of inconvenience to tax payers and difficult to collect."

It is, therefore, not clear that he had in mind the tax imposed under the Harrison Narcotic Act because that tax cannot be eliminated without destroying the act itself, and even if the complaint of the medical profession be rectified and the tax reduced to the nominal amount at which it was originally fixed from three dollars to one dollar, the inconvenience to taxpayers and the difficulty of collection will not be lessened. Nevertheless, it seems quite as important to relieve complaining citizens of an illogical unjust and unnecessary tax burden as it is to relieve them of similar burdens merely because they are inconvenient or because the enforcement of the obligation is difficult.

Any tax imposed on physicians under the Harrison Narcotic Act in excess of the amount necessary to vest the Federal Government with jurisdiction is merely an occupation tax without reason or excuse so long as a similar tax is not imposed on other callings.

The tax can be distributed by physicians among their patients, of course, through increases in fees but in so far as this might be done the tax would represent merely a federal tax on the sick and the injured, and it seems at least questionable whether the Federal Government desires to add to the burdens of persons already afflicted.

The tax collected under the Harrison Narcotic Act is now far in excess of the amount expended for its enforcement but this is not urged as the prime reason for reduction, for the act is designed for the benefit of the people at large, and there is therefore no reason why the cost of enforcing it should be imposed on certain selected groups, the members of which receive no special benefit by reason of its enforcement. The cost of enforcement is clearly a proper charge on the general revenues of the Government.

*Federal Income Tax Deduction of the Ordinary and Necessary Expenses.* The Revenue Act of 1921 provides

*Section 214 (a) That in computing net income there shall be allowed as deductions*

*(1) All the ordinary and necessary expenses paid or incurred during the taxable year in carrying on any trade or business including*  
*traveling expenses (including the entire amount expended for meals and lodging expenses) while away from home in the pursuit of a trade or business*

Physicians who desire to increase their professional knowledge and skill, to extend their professional acquaintance and to improve the conditions under which they practice, attend from time to time meetings of medical associations and take courses of post-graduate study. They pay the cost out of their gross professional incomes and such benefits as they derive go toward increasing their subsequent incomes and react to increase the federal revenues. But the Commissioner of Internal Revenue has somehow arrived at the conclusion that these expenses are of a personal nature and therefore not deductible in computing the federal income tax. *Cum Bul Dec 1921 p 171 and Jan. 1922 p 123*

The rulings of the Commissioner of Internal Revenue might be reversed on appeals to the courts. But no such appeal has been made because although the burden imposed by these rulings on the profession as a whole is considerable, the burden imposed on any one physician is so small that he submits to what he regards as an injustice, and pays the amount exacted of him rather than submit to the expense, loss of time, and annoyance involved in contesting the matter in court. For that reason, it is urged that relief be given through a clarification of the statute by legislative enactment.

Respectfully

(Signed) Wm C. Woodward  
Executive Secretary

Bureau of Legal Medicine and Legislation

## THE PRACTICE OF MEDICINE ACT

The Chairman of the Committee on Legislation was hopeful that he might publish the bill as finally decided upon as being most satisfactory to the members of the medical profession of the State. In view of the fact that the State Department of Education proposes to introduce, and has been sufficiently cordial to consult with your Chairman and with officers of the State Society, and finally has drawn a bill, which contains in the main, the suggestions offered by the Counsel of the Medical Society, in lieu of the provisions sought in the original bill offered by the State Department of Education, your Chairman of the Committee on Legislation hopes that the text of the bill as introduced, is as satisfactory as could be asked for, and has done the best to bring before the various groups those points which so many members of the Medical Society have desired to see incorporated and other measures kept out which might not be of such great benefit to the people of the State through physicians' co-operation.

No bill can contain all of the features desired by the individual groups which would be affected by the provisions of the bill and it remains with your Legislative Committee to once again ascertain from the County Chairmen and officers of the County Medical Societies, and so far as possible from counties which can meet and thoroughly go over the bill when finally settled upon in print, as to the decision of each County Medical Society relative to the action which the members of the State Society shall take as guided by the officers of the Society.

There is no question that the Legislature is ready and anxious to pass some type of bill which will tend to strengthen the Medical Practice Act and safeguard the more, the health of the people of this State, during the present session.

Especially is this true in view of the Connecticut situation and the State Department of Education will undoubtedly present to the Legislature some type of report of what has occurred there and make certain statements relative to conditions

in New York State as they are now known to exist

In view of this, it seems to behoove the County Societies to be prepared to give and take, insofar as their interests shall be safeguarded as individual physicians, and not to ally themselves with the groups of cultists who are preparing to oppose the bill, and will present many formal resolutions of small groups of faddists in order to give weight to such opposition and thereby put off the day of the investigation of their cult practices

Should the medical profession present a solid front, together with the departments interested in such a measure, being the State Department of Education, State Department of Health, and the Attorney General's Department, there is no question that a bill would be passed and it then only remains for the medical profession to oppose, in later years, proposed amendments of an unsatisfactory nature, which surely will crop up, or to ask the Legislature to adopt proper amendments to the bill, to strengthen the position of the individual physician in relation to the health of the public through the practice of the healing art

This would seem to be the fairest way of determining the wishes of the profession, should there be opposition, since a referendum vote of the Society cannot be readily taken in the short time allotted, and in view of the fact that there are about two-thirds of the medical profession of this State joined in membership with the three State Societies interested in the bill, namely, the Medical Society of the State of New York, New York State Homeopathic Society and the New York Osteopathic Society

It is to be noted, also, that quite a few smaller societies, local in character, have communicated with your Committee on Legislation, in the main in favor of the bill, and again is published a list of the societies which have taken action for or against the general propositions as embodied in the bill as first communicated to them

*In favor of proposed bill* Albany, Cayuga, Chemung, Dutchess-Putnam, Essex (no vote),

Franklin (no vote), Greene, Jefferson, Monroe, Montgomery, Oneida, Ontario, Orleans, Richmond, Rockland, St Lawrence (no vote), Saratoga, Schoharie, Schuyler, Seneca, Suffolk (no vote), Sullivan, Tompkins, Washington, Wayne, Warren, Westchester, Yates

*Opposed to the bill* Alleghany, Broome, Erie, Fulton (any bill req register), Genesee, Kings, Livingston, Madison (no vote), Nassau (no vote), Orange, Queens, Rensselaer (any bill req register), Schenectady, Ulster

It will be noted that at many of the County Society meetings, the attendance has been far below what it should have been, to discuss such an important issue, and that but 41 County Societies have been heard from, either "for" or "against" such legislation, so that your Committee on Legislation and your State Society officers, together with such County Medical Societies and their officers as have held meetings, will be to a degree the final arbiters relative to the proposed bill

Without question such opposition as develops will be united and will be composed of the cultists and welfare representatives who desire that the present state of affairs shall continue to exist, and the medical profession must be placed then in one of three positions, that of being in favor of the bill, or of being opposed to the bill, or thirdly, of being a divided profession, to bring ridicule upon our present position in the State and our honorable efforts to protect the public health of the State by a seeming non-desire to enter into co-operation in such matters

Amidst the medical profession themselves, there must exist, and will be found, those who are unfamiliar with legislative procedure, and who possibly may desire to voice opposition from their viewpoint of honest thought of any legislative change from the present, and in such instances it can only be fair to both sides that their views be given free expression in print and in the legislative halls, in a proper manner

This is what your Committee on Legislation and your State Society officers seek

## TEXT OF THE MEDICAL PRACTICE ACT

THE PRACTICE OF MEDICINE ACT

No 663

Int 637

IN SENATE,

February 11, 1924

Introduced by Mr Carroll—read twice and ordered printed and when printed to be committed to the Committee on Public Health

AN ACT\*

To amend the Public Health Law in relation to the practice of medicine.

\* EXPLANATION.—Matter in italics is new matter in brackets [ ] is old law to be omitted

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section one hundred and seventy of chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," is hereby amended as follows

§ 170 *Registration* [Registry, revocation of license, annulment of registry Every license to practice medicine shall, before the licensee begins practice thereunder, be registered in a

book kept in the clerk's office of the county where such practice is to be carried on, with name, residence, place and date of birth, and source number and date of his license to practice. Before registering, each licensee shall file, to be kept in a bound volume in a county clerk's office, an affidavit of the above facts, and also that he is the person named in such license, and had, before receiving the same, complied with all requirements as to attendance, terms and amount of study and examinations required by law and the rules of the university as preliminary to the conferment thereof, that no money was paid for such license, except the regular fees paid by all applicants therefor, that no fraud, misrepresentation or mistake in any material regard was employed by any one or occurred in order that such license should be conferred. Every license, or if lost a copy thereof legally certified so as to be admissible as evidence, or a duly attested transcript of the record of its conferment shall, before registering be exhibited to the county clerk, who, only in case it was issued or indorsed as a license under seal by the regents, shall endorse or stamp on it the date and his name preceded by the words, "registered as authority to practice medicine in the clerk's office of \_\_\_\_\_ county." The clerk shall thereupon give to every physician so registered a transcript of the entries in the register with a certificate, under seal that he has filed the prescribed affidavit. The licensee shall pay to the county clerk a total fee of one dollar for registration, affidavit and certificate. The regents shall have power at any and all times to inquire into the identity of any person claiming to be a licensed or registered physician and after due service of notice in writing, require him to make reasonable proof, satisfactory to them, that he is the person licensed to practice medicine under the license by virtue of which he claims the privilege of this article. When the regents find that a person claiming to be a physician, licensed under this article, is not in fact the person to whom the license was issued, they shall reduce their findings to writing and file them in the office of the clerk of the county in which said person resides or practices medicine. Said certificate shall be prima facie evidence that the person mentioned therein is falsely impersonating a practitioner or a former practitioner of a like or different name. The regents may revoke the license of a practitioner of medicine or annul his registration, or do both, in any of the following cases:

(a) A practitioner of medicine who is guilty of any fraud or deceit in his practice, or who is guilty of a crime or misdemeanor or who is guilty of any fraud or deceit by which he was admitted to practice, or

(b) Is an habitual drunkard or habitually ad-

dicted to the use of morphine, opium, cocaine, or other drugs having a similar effect, or

(c) Who undertakes or engages in any manner or by any ways or means whatsoever, to procure or perform any criminal abortion as the same is defined by section eighty of the penal law, or

(d) Who offers or undertakes by any manner or means to violate any of the provisions of section eleven hundred and forty two of the penal law.

Proceedings for revocation of a license or the annulment of registration shall be begun by filing a written charge or charges against the accused. These charges may be preferred by any person or corporation, or the regents may on their own motion direct the executive officer of the board of regents to prefer said charges. Said charges shall be filed with the executive officer of the board of regents, and a copy thereof filed with the secretary of the board of medical examiners. The board of medical examiners, when charges are preferred, shall designate three of their number as a committee to hear and determine said charges. A time and place for the hearing of said charges shall be fixed by said committee as soon as convenient and a copy of the charges, together with a notice of the time and place when they will be heard and determined, shall be served upon the accused or his counsel at least ten days before the date actually fixed for said hearing. Where personal service or service upon counsel can not be effected, and such fact is certified on oath by any person duly authorized to make legal service the regents shall cause to be published for at least seven times, for at least twenty days prior to the hearing in two daily papers in the county in which the physician was last known to practice, a notice to the effect that at a definite time and place a hearing will be had for the purpose of hearing charges against the physician upon an application to revoke his license. At said hearing the accused shall have the right to cross-examine the witnesses against him and to produce witnesses in his defense, and to appear personally or by counsel. The said committee shall make a written report of its findings and recommendations, to be signed by all its members, and the same shall be forthwith transmitted to the executive officer of the board of regents. If the said committee shall unanimously find that said charges or any of them are sustained and shall unanimously recommend that the license of the accused be revoked or his registration be annulled the regents may thereupon in their discretion, revoke said license or annul said registration or do both. If the regents shall annul such registration they shall forthwith transmit to the clerk of the county or counties in which said accused is registered as a physician,

a certificate under their seal certifying that such registration has been annulled, and said clerk shall, upon receipt of said certificate, file the same and forthwith mark said registration "annulled." Any person who shall practice medicine after his registration has been marked "annulled" shall be deemed to have practiced medicine without registration. Where the license of any person has been revoked, or his registration has been annulled as herein provided, the regents may, after the expiration of one year, entertain an application for a new license, in like manner, as original applications for licenses are entertained, and upon such new application they may in their discretion, exempt the applicant from the necessity of undergoing any examination.]

1 Every person now lawfully engaged in the practice of medicine within the state and every person hereafter duly authorized to practice medicine, shall, on or before October first of each year, apply to the secretary of the board of medical examiners for a certificate of registration with the regents of the university upon a blank form which shall be furnished by said secretary and shall pay at such time to said secretary a fee of two dollars, provided that any physician who has registered for five consecutive years hereunder shall be thereafter duly registered and so recorded during the time he shall thereafter continuously practice medicine in this state and shall not be required thereafter to register.

2 A physician in making his first registration hereunder shall write or cause to be written upon the application blank so furnished by said secretary his full name, post-office and residence address, the date and number of his license and such other facts for the identification of the applicant as a licensed practitioner of medicine as the regents may deem necessary and shall duly execute and verify the same before an officer empowered to take acknowledgments of deeds and deliver the same to said secretary by mail or in person. Subsequent registrations after the first registration need not be upon a sworn application by the applicant unless in a particular case the regents, for reasons satisfactory to them, may require that the application be under oath, such subsequent registration shall be made with as little inconvenience to duly licensed practitioners of medicine as possible and to that end the secretary of the board may employ and use in obtaining such subsequent registrations, the assistance of the secretary of duly incorporated medical societies who shall be empowered as a representative of the secretary of the board to receive and transmit such application blanks from physicians after the physicians' first registration, together with the license fees payable upon such applications.

3 The secretary of the board, on or before August first of each year, after the first registra-

tion, shall mail or cause to be mailed to every physician registered in his office, (except those who have registered for five successive years) a blank form of application for registration addressed to the last known post-office address of such physician or may cause such blank form of application to be sent to such physician through the secretary of any duly incorporated medical society. The form of application shall be such as to contain proper spaces for the insertion by the applicant of the information required under paragraph 2 of this section.

4 Upon receipt of such application by said secretary of the board, together with the fee of the applicant and after the said board has ascertained that the applicant is duly licensed, said secretary shall issue forthwith to the applicant entitled to the same, a certificate of registration, under the seal of the university, for the year ensuing and ending September thirtieth.

Upon the first day of January in each year, or within ten days thereafter, the secretary of the board shall publish and cause to be mailed to each physician registered hereunder in this state, a printed list of the duly registered physicians in this state and each such published list shall contain at the beginning thereof these words:

"Each registered physician receiving this list is requested to report to the Secretary of the Board and to the secretary of any duly incorporated county medical society existing in the county of his residence or to the secretary of any incorporated state medical society in which said county medical society is represented, the name and address of any person known to be practicing medicine whose name does not appear in this registry. The names of persons giving such information shall not be divulged."

The names of physicians which shall in any year be added to said list after the same shall have been so printed and distributed as aforesaid, shall be reported quarterly to the secretary of any duly incorporated State Medical Society of which county medical societies are components.

5 Any licensed physician who having failed or neglected to register by October first of any year as required by the provisions of this section, shall be required to pay upon registration, in addition to the fee of two dollars, a further fee of one dollar for each thirty days or part thereof, that he is in default, and any licensed physician who engages in practice and wilfully refuses or omits to register hereunder, shall be subject to a civil penalty of one dollar for each day that such wilful refusal or omission shall continue, provided that if the same continues for more than thirty days the penalty thereafter shall be five dollars per day so long as the said wilful refusal or omission shall continue, said penalties shall be recoverable in an action by the attorney

general of the state maintained in the name of the people of the State of New York

6 The penalties provided in this section for failure, neglect or omission of a duly licensed physician to register under this article shall be the only penalties that may be imposed therefor

7 Each licensed physician shall conspicuously display his proper registration certificate in his office at all times

8 The foregoing provisions providing for registration shall apply also to those to whom a license to practice osteopathy shall have heretofore or may hereafter be granted

§ 2 Section one hundred and seventy-one of such chapter as amended by chapter fifty-three of the laws of nineteen hundred and fifteen is hereby repealed

§ 3 Section one hundred and seventy-two of such chapter is hereby renumbered section one hundred and seventy-one

§ 4 Section one hundred and seventy-three of such chapter as amended by chapter six hundred and thirty of the laws of nineteen hundred and eighteen is hereby renumbered section one hundred and seventy-two and amended to read as follows

[173] 172 Construction of this article This article shall not be construed to affect commissioned medical officers serving in the United States army navy, or marine hospital service, while so commissioned, or any one while actually serving without salary or professional fees on the resident medical staff of any legally incorporated hospital, or any legally registered dentist exclusively engaged in practicing dentistry, or any person or manufacturer who mechanically fits or sells lenses artificial eyes, limbs or other apparatus or appliances or is engaged in the mechanical examination of eyes, for the purpose of constructing or adjusting spectacles, eye glasses and lenses, or any lawfully qualified physician in other states or countries meeting legally registered physicians in this state in consultation, or any physician residing on a border of a neighboring state and duly licensed under the laws thereof to practice medicine therein whose practice extends into this state and who does not open an office or appoint a place to meet patients or receive calls within this state, or any physician duly registered in one county called to attend isolated cases in another county, but not residing or habitually practicing therein, or the furnishing of medical assistance in case of emergency, or the domestic administration of family remedies, or the practice of chiropody, or the practice of the religious tenets of any church The prohibition against the use of the title "doctor" or any abbreviation thereof as in this article provided, shall not be construed to obridge the right to the use of any academic degree legally conferred by any duly constituted college

or university authorized to confer such degrees as recognized by the laws of this state and the rules of the regents This article shall be construed to repeal all acts or parts of acts authorizing conferment of any degree in medicine causa honoris or ad eundem or otherwise than on students duly graduated after satisfactory completion of a preliminary medical course not less than that required by this article as a condition of license It is further provided that any person who shall be actively engaged in the practice of osteopathy in the state of New York on the thirteenth day of May nineteen hundred and seven and who shall present to the board of regents satisfactory evidence that he is a graduate in good standing of a regularly conducted school or college of osteopathy within the United States which at the time of his or her graduation required a course of study of two years or longer, including the subjects of anatomy physiology, pathology, hygiene, chemistry, obstetrics diagnosis and the theory and practice of osteopathy, with actual attendance of not less than twenty months which facts shall be shown by his or her diploma and affidavit shall upon application and payment of ten dollars be granted, without examination, a license to practice osteopathy, provided application for such license be made within six months after the thirteenth day of May, nineteen hundred and seven A license to practice osteopathy shall not permit the holder thereof to administer drugs or perform surgery with the use of instruments Licenses to practice osteopathy shall be registered in accordance with the provisions of this article and the word osteopath be included in such registration, and such license shall entitle the holder thereof to the use of the degree D O or doctor of osteopathy

5 Section one hundred and seventy-four of such chapter is hereby renumbered section one hundred and seventy-three and amended as follows

173 Penalties [174 Penalties and their collection] Any person who not being then lawfully authorized to practice medicine within this state and so registered according to law, shall practice medicine within this state without lawful registration or in violation of any provision of this article, and any person who shall buy, sell or fraudulently obtain any medical diploma license, record or registration, or who shall aid or abet such buying, selling or fraudulently obtaining, or who shall practice medicine under cover of any medical diploma, license, record or registration illegally obtained, or signed, or issued unlawfully or under fraudulent representations or mistake of fact in a material regard, or who, after conviction of a felony, shall attempt to practice medicine, or shall so practice and any person who shall in connection with his name

use any designation tending to imply or designate him as a practitioner of medicine within the meaning of this article without having registered in accordance therewith, or any person who shall practice medicine or advertise to practice medicine under a name other than his own, or any person, not a registered physician, who shall advertise to practice medicine, shall be guilty of a misdemeanor. Any person who shall practice medicine under a false or assumed name, or who shall falsely personate another practitioner or former practitioner of a like or different name, shall be guilty of a felony. When any prosecution under this article, or under sections eleven hundred and forty-two, eighty, eighty-one, eighty-two, seventeen hundred and forty-seven of the penal law, and any amendments thereto is made on the complaint of any incorporated medical society of the state, or any county medical society entitled to representation in a state society, any fines collected shall be paid to the society making the complaint, and any excess of the amount of fines so paid over the expense incurred by the said society in enforcing the medical laws of this state, shall be paid at the end of the year to the county treasurer.]

"1 Any person who shall

(a) sell, or fraudulently obtain or furnish any medical diploma, license, record or registration, or aid or abet in the same, or

(b) practice medicine under cover of any medical diploma, license, record or registration illegally or fraudulently obtained or signed or issued unlawfully or under fraudulent representation or mistake of fact in a material regard, or

(c) advertise to practice medicine under a name other than his own or under a false or assumed name, and

2 Any person, who, not being then lawfully licensed and authorized to practice medicine within this state and so registered according to law, shall

(a) Practice or advertise to practice medicine or

(b) Use in connection with his name any designation tending to imply or designate him as a practitioner of medicine, or

(c) Use the title "doctor" or any abbreviation thereof in connection with his name or with any trade name in the conduct of any occupation or profession involving or pertaining to the public health, unless duly authorized by law to use the same, and

3 Any person, who during the time his license to practice medicine shall be suspended or revoked shall practice medicine,

Shall be guilty of a misdemeanor and shall also be subjected to the recovery of civil penalties

Such misdemeanor shall be punishable by im-

prisonment for not more than one year or by a fine of not more than \$500 or by both such fine and imprisonment for each separate violation

4 All courts of special sessions within their respective territorial jurisdictions are hereby empowered to hear, try and determine such crimes without indictment and to impose in full the punishments of fines and imprisonments herein prescribed

Such misdemeanors shall be prosecuted upon the private information of any person by the District Attorney of the county wherein the same are committed and at any time the Attorney General may, without further authority or direction, supersede the District Attorney in the prosecution such misdemeanors

5 In addition to the criminal punishments of imprisonment and fine as above provided a civil penalty is hereby prescribed and imposed which shall be not more nor less than one hundred dollars for each such violation, to be recovered by the Attorney General in an action against the party or parties guilty of such violation, which action shall be maintained in the name of the people of the State of New York. Such civil penalties shall be cumulative, a separate penalty being recoverable for each separate violation, and each separate day's violation shall constitute a separate violation for which recovery may be had as above provided. The Attorney General, with the consent of the State Commissioner of Education, may compromise claims for such penalties and accept less than the amount claimed or due before or after an action has been begun. No compromise may be made, however, after decision made or verdict rendered, except pursuant to Section 34 of the State Finance Law. Notwithstanding the provisions of any other general, local or special law, all penalties, fees, forfeitures of bail and fines recovered under this article shall be paid to the regents who shall pay over to the Attorney General, out of the sums received, a sufficient amount to pay the salaries of such deputies and assistants as the Attorney General shall assign for the enforcement of this article, and the Attorney General is hereby authorized to pay any deficit in such salaries or any additional sum necessary out of his general appropriations. The balance of such sums retained by the regents shall be used for the expenses of the State Education Department in the enforcement of this article. On the first day of July beginning in the year nineteen hundred twenty-five and each year thereafter, the regents shall pay any balance of such funds remaining in their hands to the state treasurer. After this act shall take effect, the regents shall report to the state comptroller on the fifth day of every month the amounts received by them under this article and remaining in their hands, with all ex-

penditures made by them for the preceding month

6 Judgments for civil penalties recovered under this article may be enforced by execution against the person as provided in the civil practice act. 1 person taken into custody under such an execution shall not be admitted to the liberties of the jails and shall be confined Sundays and legal holidays included for not less than one day and at the rate of one day for each dollar of the amount of the judgment recovered for civil penalties and costs and remaining unpaid. No person shall be imprisoned more than once or for more than six months on the same judgment. The provisions of this article relative to imprisonment for such debts shall be exclusive and the provisions of the debtor and creditor law and of section seventy-two of the civil rights law shall have no application and prosecutions for a crime under this article shall not bar prosecutions for civil penalties.

7 The display of a sign or an advertisement bearing a person's name as a practitioner of medicine in any manner or by implication or containing any other matter forbidden by law shall be presumptive evidence in any prosecution or hearing that the person whose name is so borne is responsible for the display of such sign or advertisement and of a holding out and of the practice of medicine by such person for each separate day such sign or advertisement is anywhere displayed by anyone but such presumptions are rebuttable by the defence. It shall be necessary to prove in any prosecution or hearing under this article only a single act prohibited by law or a single holding out or an attempt without proving a general course of conduct in order to constitute a violation.

8 All violations of this act when reported to the regents and duly substantiated by affidavits or other satisfactory evidence shall be investigated and if the report is found to be true and the complaint substantiated, the regents shall report such violation to the Attorney General or District Attorney and request prompt prosecution. The regents may appoint such inspectors as are necessary to be paid from the funds recovered under this act at such salaries as they may determine and it shall be their duty under the direction of the regents to investigate promptly and thoroughly such violations and to procure where possible legal evidence of the same for prosecution of the offenders.

Sec 6 Article eight of such chapter is hereby amended by adding thereto a new section to be known as section one hundred and seventy-four to read as follows:

Sec 174 Revocation of certificates and annulment of registrations

1 Whenever any practitioner of medicine shall be convicted of a felony there may be presented to the regents a certified or exemplified copy of the judgment of such conviction and thereupon the registration of the person so convicted shall be annulled and his license revoked.

Upon reversal of the conviction of such practitioner the regents shall upon receipt of a certified copy of the judgment or order of reversal vacate their order of revocation and annulment of registration but nothing herein contained shall restrict the regents of power to proceed against such practitioner under the next subdivision.

2 The regents may revoke or suspend the license of a practitioner of medicine and annul his registration or reprimand or discipline as in their discretion they may deem best for the public interest in any of the following cases:

Upon the finding after due hearing:

a That a physician is guilty of fraud or deceit in the practice of medicine or in his admission to the practice of medicine or in his procuring registration, or

b That a physician has been convicted in a court of competent jurisdiction either within or without this State, of a crime involving moral turpitude

c That a physician is a habitual drunkard, or addicted to the use of morphine cocaine or other drugs having a similar effect or has become insane

d That a physician is guilty of untrue fraudulent misleading or deceptive advertising, or advertising that he can cure diseases which are recognized by the medical profession as incurable or advertising that he can cure or treat disease by a secret method, procedure, treatment or medicine, or that he can treat operate or prescribe for any human condition by a method, means or procedure which he refuses to divulge upon demand to the regents.

3 Proceedings for revocation of a license suspension of practitioners from practice or the annulment of registration under subdivision two of this section shall be begun by filing a written charge or charges against the accused. These charges may be preferred by any person corporation or public officer, or the regents may on their own motion direct the executive officer of the board of regents to prefer said charges. Any charges shall be filed with the commissioner of education and a copy thereof filed with the secretary of the board of medical examiners. The president of the board of medical examiners when charges are preferred, shall designate three of their number as a committee to hear and determine said charges. A time and place for the hearing of said charges shall be fixed by said committee as soon as convenient and a copy of

the charges, together with a notice of the time and place when they will be heard and determined, shall be served upon the accused or his counsel, at least ten days before the date actually fixed for said hearing. Where personal service or service upon counsel cannot be effected, and such fact is certified on oath by any person duly authorized to make legal service, the secretary of the board of medical examiners shall cause to be published for at least four times, at least thirty days prior to the hearing, a notice of hearing, in a newspaper published in the county in which the physician was last known to practice, and a copy of such notice shall also be mailed to the accused at his last known address. All such notices of charges shall contain a plain and concise statement of the material facts, without unnecessary repetition, but not the evidence by which the charges are to be proven, with a notification that a stenographic record of such proceedings shall be kept and that the accused shall have opportunity to appear either personally or by counsel at the hearing, with the right to produce witnesses and evidence upon his own behalf to cross-examine such witnesses, to examine such evidence as may be produced against him and to have subpoenas issued by the board. The said committee shall make a written report of its findings and recommendations, to be signed by all its members, and the same shall be forthwith transmitted to the board of regents with the entire record and evidence. If the said committee shall unanimously find that said charges, or any of them, are sustained, and shall unanimously recommend that the license of the accused be revoked or the practitioner suspended from practice, and his registration annulled, or that he be otherwise reprimanded or disciplined, the regents may thereupon in their absolute discretion, revoke or suspend said license and annul said registration or otherwise reprimand or discipline as in their absolute discretion they may deem best for

the public interest, provided that no greater penalty than that recommended by said committee be imposed. Where the license of any person has been revoked, or his registration has been annulled as herein provided, the regents may, after the expiration of one year, entertain an application for a restoration of license and registration, in like manner as original applications for licenses are entertained, and upon such new application they may in their discretion, exempt the applicant from the necessity of undergoing any examination. The regents may in their discretion restore to good standing any physician who has been suspended from practice.

4 Any licensed practitioner found guilty under the provisions of this section on charges on whose license is otherwise revoked or suspended or registration annulled, or who has been refused registration, or who is otherwise reprimanded or disciplined by the board of regents under this article shall have an order of certiorari for the purpose of reviewing such determination returnable before the Appellate Division of the judicial department where the board of regents made the determination complained of, but no such determination of the board of regents shall be stayed or enjoined except upon application to such Appellate Division, after notice to the state commissioner of education, and upon a showing that the determination of the board of regents was clearly wrong, that the constitutional rights of the applicant have been violated or that the board of regents made its determination without jurisdiction. The board of medical examiners or the board of regents may issue subpoenas and administer oaths pursuant to section 61 of the Public Officers Law in connection with any hearing or investigation under this article and it shall be the duty of such boards to issue subpoenas at the request of and upon behalf of the defence.

Sec 7 This act shall take effect July first, nineteen hundred and twenty-four

## LEGISLATIVE BILLS

### SENATE

The Narcotic Bill—Senate Int No 285 (Print No S 289), by Senator Morton J Kennedy, of New York, concurrent Assembly Int No 342 (Print No A 342), by Assemblyman Morris Weinfeld, of New York

The Narcotic Bill is still in Public Health Committee in each house, no action has been taken thereon

Attention is called to the letter of objection published in a previous number of the JOURNAL, and it is requested that, if County Legislative Chairmen and individual members of the pro-

fession have not already written letters to the Public Health Committee in both houses, especially to the Chairmen of the Committees asking that they hold the bill in its present form in committee, that they do so at once

In Re Appointing an Eye and Ear Specialist to the Medical Inspector of Schools—Senate Int No 317 (Print No S 321), by Senator Benjamin Antin of New York, concurrent Assembly Int No 370 (Print No A 372), by As-

Assemblyman Frederick S. Cole of Herkimer County, the bill is still in Public Education Committee in each house.

Your Chairman has endeavored to have the bill modified, so that the medical inspector of schools might have assistants appointed to whom he could assign whatsoever work he desired to aid him in the work of inspection thus giving him slightly greater powers for aid in school work than is at present possible.

Thus would seem to be an instance where the Medical Society can take a stand in behalf of the school children.

---

The bill in reference to amending the Insanity Law relative to approval by Governor of contracts for improvements to State hospitals for insane under Senate Int No 347 (Print No S 351), concurrent Assembly Int No 567 (Print No A 570) will be dropped.

---

The bill in reference to the sale of wood alcohol or methyl alcohol, under Senate Int No 376 (Print No 380), will be dropped.

---

The bill in reference to the penalty for unauthorized practice of dentistry, under Senate Int No 389 (Print No S 394), concurrent Assembly Int No 639 (Print No A 648), will be dropped.

---

**In Re Peddling Unpasteurized Milk**—Senate Int No 425 (Print No S 434) by Senator Chas. Hewitt of Locke N. Y., concurrent Assembly Bill Int No 642 (Print No A 651), by Assemblyman G. S. Johnson of Wayne County, which would add new section 438-a, Penal Law making it a misdemeanor to peddle from house to house raw or unpasteurized milk other than such milk from tuberculin-tested cattle.

The bill is still in Codes Committee in each house.

To your Committee on Legislation, the bill seems to be one which will further tend to safeguard the health of the people of the State.

---

**In Re Reporting Vaccinations to Local Health Officers**—Senate Int No 430 (Print No S 440) by Senator William L. Love of Brooklyn, N. Y., concurrent Assembly Int No 565 (Print No 568) by Assemblyman Frank

H. Lattin of Orleans County is still in Public Health Committee in each house.

A hearing on the above is scheduled for Wednesday February 13th at 10 a. m., before the Assembly Committee on Public Health.

Your Committee on Legislation can see no possible objection to the bill inasmuch as the law is partially in force now and this only modifies the method of reporting in having it sent to the local health officer instead of to the State Department of Health.

---

**In Re Health Districts to be Created by State Commissioner of Health**—Senate Int No 448 (Print No S 457) by Senator Daniel J. Carroll of Kings County, concurrent Assembly Int No 646 (Print No A 655), by Assemblyman Frank H. Lattin of Orleans County, which has been referred to the Public Health Committee in each house is printed here in full for the information of the profession.

STATE OF NEW YORK

No 457

Int 448

IN SENATE

January 31 1924

Introduced by Mr. Carroll—read twice and ordered printed and when printed to be committed to the Committee on Public Health.

AN ACT\*

To amend the public health law constituting chapter forty five of the consolidated laws.

*The People of the State of New York represented in Senate and Assembly do enact as follows:*

Section 1 Section four of chapter forty-nine of the laws of nineteen hundred and nine, as amended by chapter five hundred and fifty nine of the laws of nineteen hundred and thirteen, is hereby amended to read as follows:

§ 4 General powers and duties of commissioner. The commissioner of health shall take cognizance of the interests of health and life of the people of the state, and of all matters pertaining thereto. He shall exercise general supervision over the work of all local health authorities except in the city of New York. He shall be charged with the enforcement of the public health law and the sanitary code. He shall make inquiries in respect to the causes of disease especially epidemics and investigate the sources of mortality and the effect of localities, employments and other conditions upon the public health. He shall obtain collect and preserve such information relating to mortality disease and health as

---

\*EXPLANATION.—Matter in italics is new; matter in brackets [ ] is old law to be omitted.

may be useful in the discharge of his duties or may contribute to the promotion of health or the security of life in the state. He may issue subpoenas, compel the attendance of witnesses and compel them to testify in any matter or proceeding before him, and a witness may be required to attend and give testimony in a county where he resides or has a place of business without the payment of any fees. The commissioner of health may reverse or modify an order, regulation, by-law or ordinance of a local board of health concerning a matter which in his judgment affects the public health beyond the territory over which such local board has jurisdiction [and may exercise exclusive jurisdiction over all lands acquired by the state for sanitary purposes]. *He may in his discretion from time to time create health districts comprised exclusively of lands owned by, or held in trust for, the people of the state, by filing in the office of the secretary of state an order defining generally the boundaries of such district or districts. Upon the making and filing of such order the commissioner of health shall have exclusive jurisdiction within such district or districts, so defined, for sanitary and health purposes, and he, within such district or districts, shall have all the powers and duties of local boards of health and he, and such representatives as he may appoint for such purpose, shall within such district or districts have all the powers and duties under the laws of the state and the state sanitary code which local health officers now have or hereafter shall have within their respective localities. The state health commissioner may from time to time modify or repeal such order or*

*orders.* The commissioner of health and any person authorized by him so to do, may, without fee or hindrance, enter, examine and survey all grounds, erections, vehicles, structures, apartments, buildings and places.

§ 2 This act shall take effect immediately.

*Comment.* None at present, would be glad to receive comment from physicians of the State who might be interested.

**In Re Violations of Local Health Orders—**Senate Int No 455 (Print No S 464), by Senator Geo L Thompson of Kings Park, N Y, concurrent Assembly Int No 513 (Print No A 515), by Assemblyman Edwin W Wallace of Nassau County, is still in Codes Committee in each house. See printed bill in last issue of JOURNAL.

*Comment.* Your Committee on Legislation feels that the Medical Society should be in favor of such a measure.

**In Re Refusal to Comply with Rule or Order of Local Health Board—**Senate Int No 459 (Print No S 468), by Senator George L Thompson of Kings Park, N Y, concurrent Assembly Int No 542 (Print No 545), by Assemblyman Edwin W Wallace of Nassau County, is still in Public Health Committee in each house. See printed bill in last issue of JOURNAL.

*Comment.* Your Committee on Legislation feels that the Medical Society should be in favor of such a measure.

## NEW BILLS SINCE LAST ISSUE

**Amendment to Workmen's Compensation Law—**Senate Int No 468 (Print No S 477), by Senator Peter J McGarry of Queens County, concurrent Assembly Int No 682 (Print No A 693), by Assemblyman A L Miller of Westchester County, which has been referred to the Labor and Industries Committee of each house, is printed here in full for the information of the profession.

STATE OF NEW YORK

No 477

Int 468

IN SENATE,

February 4, 1924

Introduced by Mr McGarry—read twice and ordered printed, and when printed to be committed to the Committee on Labor and Industries

## AN ACT\*

To amend the workmen's compensation law, in relation to not requiring technical rules of evidence or procedure.

*The People of the State of New York, represented in Senate and Assembly, do enact as follows:*

**Section 1.** Section one hundred and eighteen of chapter eight hundred and sixteen of the laws of nineteen hundred and thirteen, entitled "An act in relation to assuring compensation for injuries or death of certain employees in the course of their employment, and repealing certain sections of the labor law relating thereto, constituting chapter sixty-seven of the consolidated laws," as re-enacted by chapter forty-one

\* EXPLANATION—Matter in italics is new, matter in brackets [ ] is old law to be omitted.

of the laws of nineteen hundred and fourteen, and as last amended by chapter six hundred and fifteen of the laws of nineteen hundred and twenty-two, is hereby amended to read as follows

§ 118 [Technical] *Technical rules of evidence or procedure not required. The commissioner, board, referee or deputy commissioner in making an investigation or inquiry or conducting a hearing shall not be bound by common law or statutory rules of evidence or by technical or formal rules of procedure, except as provided by this chapter, but may make such investigation or inquiry or conduct such hearing in such manner as to ascertain the substantial rights of the parties, and may make such physical examinations and practical tests of claimants to determine loss of use and proportionate loss of use of a member and the result of such examinations and tests shall be made part of the record, and shall be competent evidence upon which to base an award.* Declaration of a deceased employee concerning the accident shall be received in evidence and shall, if corroborated by circumstances or other evidence be sufficient to establish the accident and the injury

§ 2 This act shall take effect immediately

Comment We are in favor of such a measure

In Re Deduction from Income Tax of All Expenses Paid for Medical, Surgical or Dental Services—Senate Int No 527 (Print No S 543), by Senator John A Hastings of Kings County, concurrent Assembly Int No 65 (Print No A 65), by Assemblyman Joseph Reich of Kings County Still in committee

The Child Experimentation Bill—Senate Int No 584 (Print No 608), by Senator John P Ryan of Rensselaer County no concurrent Assembly Bill as yet referred to the Senate Codes Committee is printed here in full for the information of the profession

STATE OF NEW YORK

No 608

Int. 584

IN SENATE,

February 6 1924

Introduced by Mr Ryan—read twice and ordered printed, and when printed to be committed to the Committee on Codes

AN ACT\*

To amend the penal law in relation to medical and surgical experiments upon children in certain institutions.

*The People of the State of New York represented in Senate and Assembly do enact as follows*

EXPLANATION—Matter in italics is new matter in brackets [ ] is old law to be omitted.

Section 1 Section four hundred and eighty-three of the penal law is hereby amended to read as follows

§ 483 Endangering life or health of child. A person who

1 Wilfully causes or permits the life or limb of any child actually or apparently under the age of sixteen years to be endangered or its health to be injured or its morals to become depraved, or

2 Wilfully causes or permits such child to be placed in such a situation or to be engaged in such an occupation that its life or limb is endangered or its health is likely to be injured, or its morals likely to be impaired[ ] or

3 Instigates engages in or carries on any surgical experimentation upon such a child in a public or private hospital or charitable institution, [Is] is guilty of a misdemeanor. Nothing in this or the next preceding section shall prohibit legitimate and necessary medical and surgical, or other treatment by well established methods for the benefit of the child

§ 2 This act shall take effect immediately

This is the same bill as was defeated last year and the same comment is given once more, namely—

‘That the new section is unnecessary and useless, since protection is given children under other laws. It is a slur on the medical profession in that it insinuates that children in public and private institutions are being experimented upon’

County Legislative Chairmen and individual members of the profession are urged to have letters written in protest against this amendment to the Senate Codes Committee, especially to the Chairmen

It is also urged that the County Legislative Chairmen see their individual representatives in the legislature and set before them the arguments against such a measure as the above and ask them to oppose the bill should it be brought to the floor of either house for passage.

The Anti Vivisection Bill—Senate Int No 588 (Print No 612), by Senator John P Ryan of Rensselaer County, no concurrent Assembly bill as yet, referred to the Senate Codes Committee is printed here in full for the information of the profession

STATE OF NEW YORK

No 612

Int. 588

IN SENATE

February 7 1924

Introduced by Mr Ryan—read twice and ordered printed, and when printed to be committed to the Committee on Codes

## AN ACT\*

To amend the penal law, in relation to experiments upon living dogs

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section one hundred and eighty-five of the penal law is hereby amended to read as follows

§ 185 Overdriving, torturing and injuring animals, failure to provide proper sustenance A person who overdrives, overloads, tortures or cruelly beats or unjustifiably injures, maims, mutilates or kills any animal, whether wild or tame, and whether belonging to himself or to another, or deprives any animal of necessary sustenance, food or drink, or neglects or refuses to furnish it such sustenance or drink, or causes, procures or permits any animal to be overdriven, overloaded, tortured, cruelly beaten, or unjustifiably injured, maimed, mutilated or killed, or to be deprived of necessary food or drink, or who wilfully sets on foot, instigates, engages in, or in any way furthers any act of cruelty is guilty of a misdemeanor Nothing herein contained shall be construed to prohibit or interfere with any properly conducted scientific experiments or investigations, which experiments shall be performed only under the authority of the faculty of some regularly incorporated medical college or university of this state, *but such experiments or investigations shall not be made upon a living dog*

§ 2 This act shall take effect immediately

This, too, is in the same form as in previous years, and is to be strenuously objected to by all members of the medical profession

County Legislative Chairmen and individual members of the medical profession, as well as laymen of influence who can be interested in such a measure, are urged to get busy and protest against the last two lines of the bill, which is the old anti-vivisection agitation, and urge that these lines be struck out of the bill "*But such experimentation or investigation shall not be made upon a living dog*"

In Re Distribution of Information Concerning Results of Scientific Study—Senate Int No 436 (Print No S 445), by Senator Michael E Reiburn, of New York, concurrent Assembly Int No 588 (Print No A 592), by Assemblyman Joseph Gavagan, of New York City; referred to Judiciary Committee in each house, is printed here in full for the information of the medical profession

\* EXPLANATION—Matter in italics is new, matter in brackets [ ] is old law to be omitted

## STATE OF NEW YORK

No 445

Int 436

IN SENATE,

January 30, 1924

Introduced by Mr Reiburn—read twice and ordered printed, and when printed to be submitted to the Committee on the Judiciary

## AN ACT

To amend the public officers law, in relation to the dissemination of information concerning scientific studies and research

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Chapter fifty-one of the laws of nineteen hundred and nine, entitled "An act in relation to public officers, constituting chapter forty-seven of the consolidated laws," is hereby amended by inserting therein a new section, to be section seventy-three, to read as follows

§ 73 Dissemination of information concerning scientific studies No employee or member of any institution, society or foundation supported in whole or in part by public moneys, or of any state or municipal department, shall discriminate in the dissemination of information concerning the results of scientific study and research among agencies suitable to propagate the same, but the same shall be available without restriction to all such agencies and to all persons applying therefor

§ 2 This act shall take effect immediately

*Comment* This bill seems inadvisable inasmuch as any employee—which would mean a laborer—might impart garbled information concerning results of which he had only partially heard, of scientific research in an institution to some person or persons who might wish to utilize that information in a dishonorable way to the detriment of the institution

It would seem that there were sufficient laws existing at the present time whereby such information can be obtained in a perfectly legal manner by anyone who desires to be honestly informed about the same

County Legislative Chairmen and individual members of the profession are asked to put their weight in correspondence behind the opposition, by writing to each member of the Senate and Assembly Judiciary Committees

Assembly Medical Inspection in Schools Bill—Assembly Int No 66 (Print No A 66), by Assemblyman Joseph Reich of Kings County, is still in Assembly Public Education Committee, no concurrent bill has as yet appeared in the Senate

*Comment* This bill cannot be too strongly opposed by the members of the medical profession and if the weight of the profession can only be expressed to the Public Education the obvious features may be withdrawn and the members of the profession will not have forced upon them a type of state medicine against which they have struggled so strenuously.

There is a desire upon the part of certain persons to see the bill passed in its present form, and unless the Society through its members voices strong opposition thereto it has a likelihood of introduction in the Senate and of quick passage toward the end of the session.

*In Re Nursing and First Aid Services in Factories, etc.*—Assembly Int No 309 (Print No A 309), by Assemblyman Joseph Reich of Kings County, is still resting in Assembly Labor and Industries Committee no concurrent Senate Bill has as yet appeared.

No further comment as yet

*The Narcotic Bill*—Assembly Int No 342 (Print No A 342), by Assemblyman Morris Weinfeld, of New York, concurrent Senate Int No 285 (Print No S 289), by Senator Morton J. Kennedy, of New York County, see concurrent Senate Bill Int No 285 for comment.

*In Re Appointing an Eye and Ear Specialist to Assist the Medical Inspectors of Schools of Herkimer County*—Assembly Int. No 370 (Print No A 372), by Assemblyman Frederic S. Cole, concurrent Senate Int No 317 (Print No S 321), by Senator Benjamin Antin of New York County, see concurrent Senate bill for comment.

*In Re Reporting Vaccinations to Local Health Officers*—Assembly Int No 565 (Print No A 568), by Assemblyman Frank H. Lattin, of Orleans County concurrent Senate Int No 430 (Print No S 440), by Senator William L. Love, see concurrent Senate bill for comment.

*In Re Peddling Unpasteurized Milk*—Assembly Int No 642 (Print No A 651) by Assemblyman G. S. Johnson, of Wayne County, concurrent Senate Int. No 425 (Print No S 434), by Senator Chas. Hewitt, of Locke, N. Y., see concurrent Senate bill for comment.

*In Re Health Districts to be Created by State Commissioner of Health*—Assembly Int No 646 (Print No A 655), by Assembly-

man Frank H. Lattin of Orleans County, concurrent Senate Int. No 448 (Print No 457), by Senator Daniel J. Carroll, of Kings County, see concurrent Senate bill for comment.

*Amendment to Workmen's Compensation Law*—Assembly Int No 682 (Print No A 693) by Assemblyman A. I. Miller, of Westchester County, concurrent Senate Int No 468 (Print No S 477), by Senator Peter J. McGarry, of Queens County, see concurrent Senate bill for comment.

Assembly Int No 717 (Print No 731), by Assemblyman Morris Weinfeld of New York County concurrent Senate Int No 140 (Print No S 140), by Senator Michael Reburn, of New York County, would amend Section 13, Workmen's Compensation Law by striking out provision that claim for medical treatment shall not be valid against employer unless physician, within twenty days following first treatment furnish report of injury and treatment. The bill has been referred to the Labor and Industries Committee in each house.

Assembly Int. No 730 (Print No A 744), by Assemblyman Samuel McCleary, of Montgomery County, is printed here in full for the information of the profession.

STATE OF NEW YORK

IN ASSEMBLY

February 4 1924

Introduced by Mr. McCleary—(by request)—read once and referred to the Committee on Public Health.

AN ACT

To amend the public health law, in relation to prevention of skin and scalp diseases.

*The People of the State of New York represented in Senate and Assembly do enact as follows:*

Section 1 Chapter forty nine of the laws of nineteen hundred and nine entitled "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," is hereby amended by inserting therein, after section three hundred and fifteen a new section to be section three hundred and fifteen a to read as follows:

§ 315 a Prevention of scalp and skin diseases. All wholesale and retail hatters and milliners shall use in their establishments a sanitary head covering or cap of light weight and texture, of paper or the like, so constructed that it may be

discarded after a single use, for the prevention of and to check the spread of scalp and skin diseases and irritations. The state commissioner of health is hereby vested with full control and authority to inspect and supervise all establishments in which are sold manufactured or used, hats or other headcoverings for men and women, where such hat or headcovering is used for more than one person, and he may adopt such rules and regulations as are necessary for the proper enforcement of this section.

§ 2 This act shall take effect July first, nineteen hundred and twenty-four

Assembly Int No 815 (Print No A 841), by Assemblyman Walter Clayton, of Kings County, is printed here in full for the information of the profession

STATE OF NEW YORK

IN ASSEMBLY,

February 7, 1924

Introduced by Mr Clayton—read once and referred to the Committee on Public Health

AN ACT

To amend the public health law, in relation to the

unauthorized reference to a place of business as a drug store or pharmacy

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," is hereby amended by inserting therein a new section, to be section two hundred and thirty-four-a, to read as follows

§ 234-a Unauthorized use of terms "drug store" or "pharmacy." No person or corporation shall hereafter carry on, conduct or transact business under a name which contains as a part thereof the words "drug store" or "pharmacy," or in any manner by advertisement, circular, poster, sign or otherwise describe or refer to the place of business conducted by such person or corporation by the terms "drug store" or "pharmacy," unless the place of business so conducted is a drug store or pharmacy duly registered and authorized by the state board of pharmacy. Any person or corporation violating this section shall be guilty of a misdemeanor, and if a corporation, any officer thereof who knowingly participates in such violation, shall also be guilty of a misdemeanor.

§ 2 This act shall take effect immediately

### Deaths

AUBRY, WALLACE J. C., Binghamton, Laval University, 1909, Albany Medical College, 1910 Fellow American Psychiatric Association, Member State Society, Senior Assistant Physician Binghamton Hospital. Died January 23, 1924

GIFFORD, HERMAN LINCOLN, Brooklyn, Long Island College Hospital, 1891. Member State Society. Died February 3, 1924

GRAM, FRANKLIN C., Buffalo, Buffalo Medical College, 1891. Fellow American Medical Association, American Public Health Association, Member State Society, for many years Secretary of the Medical Society of the County of Erie,

Buffalo Academy of Medicine, Physician Lutheran Church Home. Died February 3, 1924

HASBROUCK, CORNELIUS VAN DYKE, Rosendale, Long Island Hospital, 1876. Member State Society, Physician Benedictine Hospital, Kingston. Died January 31, 1924

HUBER, JOHN BESSNER, Pomfret, Conn., Bellevue Medical College, 1889, College of Physicians and Surgeons of New York, 1890. Fellow American Medical Association, Member State Association, Member State Society, Visiting Physician St. Joseph's Hospital for Consumptives. Died February 16, 1924

## CORRESPONDENCE

New York, February 4, 1924

To the Editor,

NEW YORK STATE JOURNAL OF MEDICINE.  
SIR

A very important and inspiring editorial in your issue of February 1, 1924, is entitled "Develop County Society Activities." There is no doubt that a profession united by the bonds imposed by the officially recognized medical bodies, such as the County Societies, can accomplish much of good, not only for itself but for the public interest. It is essential for every reputable practitioner of medicine in this State to be enrolled in his county society and the fact that he is a reputable practitioner should be announced to his colleagues and to the public in an accepted and official publication, such as the Medical Directory published by our State Society. A book of this kind should be authoritative. It should contain the names of physicians who are regularly licensed to practise, and not only licensed, but not practising contrary to what we have accepted as sound ethical principles. Unfortunately our State Medical Directory fails to supply these standards and at the present time contains a goodly proportion of names of physicians who are a discredit to the profession and with whom reputable practitioners should refuse to be associated in the pages of an official directory.

Is it not an opportune moment for the State Society to take up this question and to provide itself with a censorship committee if we may call it thus, to closely scrutinize the names which go to make up the directory of physicians of this State? It would be a source of satisfaction to every member of the State Medical Society to know that his associates in the official directory were at least reputable and had no connection with quackery or had been convicted for questionable practices. The task might be a difficult one, or even a disagreeable one, but if the Directory assumed to occupy this high plane much would be done to bring into the fold those practitioners who had not thought it worth while to do so previously. It would be the best incentive for the membership committees of our various county societies and, in fact, would make their task an easier one. Every reputable practitioner of the State should be a member of his County Society and if the profession could present a united front there might be less need for supervisory registration as contemplated amendments to the Medical Practice Act.

There can be no valid objections proposed to a censorship committee setting up certain standards to be confirmed and upheld by the State Society, based on what a man is doing today, not what he was at the time of his graduation, or when he obtained his license to practise. The New York City list of physicians contains many names of acknowledged quacks, frauds, flagrant advertisers and abortionists—they should be eliminated and not accorded the privilege of association with decent, reputable practitioners. If this is accomplished much will be gained to place the medical profession of the State on a plane commensurate with the dignity which it should receive.

GEORGE W. KOSMAK, M.D.

February 14, 1924

Dr Nathan B. Van Etten, Editor,  
NEW YORK STATE JOURNAL OF MEDICINE,  
17 West 43d Street,  
New York City

DEAR DR. VAN ETTEN:

The State Department of Education is responsible for licensing physicians in New York State. It goes without argument that this department should have the authority and the machinery to protect its responsibilities in the matter of licensing physicians. The dignity and value of such licenses cannot be maintained unless the department granting them is in position to punish counterfeiters and imposters.

In so far as the proposed Medical Practice Act fixes the responsibility of the State Department of Education to protect functions it has assumed the measure is beyond criticism. In February, 1924, it seems as though it might be politically expedient for the medical profession to agree to pay to the Department of Education a yearly sum of about \$32,000 in order to induce the State through this department to perform a function that it is the unquestioned duty of the State to perform. I for one believe that the principle of bribing the State to perform its duty is fundamentally wrong. Compromises of expediency as regards details are often necessary and wise, but compromises of expediency involving fundamental principles seldom, if ever, result in permanent good. I believe that the compromise as to principle involved in the \$200 yearly tax-for-protection plan can only result in ultimate harm to the medical profession and a delay of a satisfactory solution of the problem.

At the Albany County Society meeting held in January, it was stated that although the State Department of Education has had supervision of the licensing of physicians in New York State for a period of 27 years, the department has not yet installed a properly indexed catalogue showing the physicians it has licensed. The failure of this department to develop a workable card index is no reason for granting it more responsibilities in the line of cataloging the physicians of this State.

The American Medical Association has developed a complete and accurate registry of all actual and alleged medical graduates in the United States and Canada. In addition to the data published in the directory the association has on file much more detailed data concerning not only the legitimate regular practitioners of this country and Canada but full and complete records of every medical crook, big or little, with his many names and aliases, together with changes of address, letters, circulars, records of court convictions, if any. There is, therefore, no real need of the State Department of Education duplicating this information and the real excuse for the annual compulsory reregistration reverts to the \$32,000, a part of which might be available for the prosecution of illegal practi-

tioners. From an individual viewpoint \$32,000 might seem to be a fairly large and adequate sum of money. The advantages of this sum available for work in a county of 50,000 population has been repeatedly emphasized. As a matter of fact, after allowing for overhead costs incident to registration, this county's share available for prosecution of quacks would amount to but a little more than \$85 per year. I believe that this gives us a fair perspective as to the practical results to be anticipated from the \$32,000 annual contribution.

I would take little interest in this \$32,000 if I did not believe that it would ultimately do more harm than good. It will put the quacks in the position to claim that the funds to pay for their prosecution come from the so-called medical trust and before the public they will pose as martyrs being persecuted by rivals. Just in so far as the medical profession is placed in a position of having bribed the State to protect the profession's private interests the effectiveness of the campaign against irregular practitioners is bound to be weakened.

Very sincerely,

E MAC D STANTON, *Chairman,*  
*Legislative Committee,*  
Schenectady County Medical Society

---

# State Department of Health

## PROSECUTIONS FOR FAILURE TO REPORT BIRTHS

In the course of a check which has been conducted by the Division of Vital Statistics to ascertain the completeness of birth registration, three physicians were discovered in one section of the State who have neglected to report births which they attended. One of these physicians had failed to report ten births during the years 1922 and 1923. The evidence of these failures to comply with the law will be transmitted by the Commissioner of Health to the Attorney-General as provided by Section 393 of the State Vital Statistics Law. A similar course will doubtless be followed in other sections of the State where physicians and midwives have failed to register births. Thus far, the check shows that registration is between 95 and 97 per cent complete. Most of the unrecorded births are believed to have been attended by unlicensed midwives, lay relatives and friends, not by physicians and licensed midwives.

## DR. O. R. EICHEL TO WORK WITH LEAGUE OF NATIONS

Leave of absence has been granted to Dr. O. R. Eichel, Director of the Division of Vital Statistics, in order that he may accept an invitation to assume direction of the League of Nations' Service of Epidemiological Intelligence and Public Health Statistics.

## VACCINATION OF SCHOOL CHILDREN

During the recent mild epidemic of smallpox in the Village of South Cornung every one of the 125 school children were vaccinated. Simultaneously in the neighboring city of Cornung over 3,000, or about 84 per cent of the school children were vaccinated.

## POST-GRADUATE COURSE IN INFECTIOUS DISEASES AND PUBLIC HEALTH

The Albany Medical College, cooperating with the State Department of Health, for the fifth consecutive year offers to physicians a course in infectious diseases and public health. Primarily, this course was evolved for the benefit of health officers, but many physicians not occupying such positions have in past years found this instruction of benefit. Those interested are invited to communicate with Dr. C. C. Duryee, State Department of Health, Albany.

## VINCENT'S ANGINA

The laboratory of the State Health Department calls attention to the fact that extreme care should be used in interpreting the results of laboratory examination of specimens from patients suspected of suffering with Vincent's Angina.

Fusiform bacilli and spirochetes which are associated with this disease are readily found in buccal cavities which show no evidence of the ulceration usually attributed to their presence. Opinions differ as to the etiological relationship of these organisms to sore throat.

Recently a post-mortem examination was made on a case which had been diagnosed as Vincent's angina. Specimens from an ulcerated lesion involving the base of the tongue had been reported by a laboratory to contain fusiform bacilli and spirochetes. At the autopsy, however, a carcinoma of the upper part of esophagus was found.

## TOXIN-ANTITOXIN CERTIFICATES AVAILABLE

Upon request the Department will furnish to physicians blank forms for certifying the administration of toxin antitoxin to school children. It is planned to give each child of preschool age who has received three injections of the mixture one of these certificates so that subsequently when he attends school the child may be able to present this evidence of immunization.

## NEW PRENATAL CLINIC

The City of Little Falls has established a prenatal clinic under the direction of the Division of Maternity, Infancy and Child Hygiene of the State Department of Health. It is expected that soon the city itself will assume all the responsibilities of this clinic.

## RELATION OF INFANT DEATHS TO MATERNAL DEATHS

The Division of Vital Statistics reports that among other preliminary results, its researches show that in New York State out of every 1,000 mothers who die from causes related to childbirth over 500 of their babies also die before the end of their first year of life—usually within a few weeks of birth. If to this number were added the number of babies born dead, and those who are unborn because of the death of the mother before delivery, the total loss of infant lives would be far greater than 500 for each 1,000 mothers.

# THE DAILY PRESS

The daily press reflects the thoughts of the people generally regarding medical subjects. Newspapers are always looking for the unusual and the wonderful in medicine as in other subjects. They seek medical light on the sickness of prominent persons, but the great mass of medical items in the current newspapers is of a public health nature. The medical items which we are printing this week constitute a cross section of medical news gleaned from the papers from all over New York State. They show that the newspapers are keenly alive to the promotion of health among the people—(The Editor)

How many different systems of health and of healing cults can you name? The Brooklyn Eagle of February 15th contains a list of fifty-five different methods of medical practice and cures. This list had been compiled by Health Commissioner Frank J. Monaghan as the result of a request that citizens send him information and complaints about irregular medical practitioners. Dr. Monaghan's list is as follows:

Aerotherapy, Astral healers, autothermy, beautifier establishments, biodynamochromatic therapy, blood specialists, bone setters, cancer cures, chromotherapy, Christos (blood washers), chromopathy, diet therapy, diathermy, drugless healers, electrotherapy, electrotonic methods, electric light diagnosis, electrolytic methods, electrotonapro-therapy, geo-therapy, hypnotist, hydro-therapy, herbalist, heliotherapy, irido-therapy diagnosticians, Kneipp cure, Leonic healers, mental healing, medical gymnast, machanotherapy, naturologist, natureopath, neuro-therapy, Naprapath, optical institutes, obesity cures, patent medicine men, photo-therapy, physic-therapy, psycho-therapy, practotherapy, quartz therapy, Spondylo therapy, sanipractor, spectrocrome, special food faddists, special drug faddists, spectro-therapy, tropho, the rapy, telathermy, vacuum and serum cures, vitopath, zodiac therapy and Zonet therapy.

This list does not include chiropractic, Christian science, Couéism, physical culture, and new thought. It also totally ignores the old grandmother remedies, and the jumbled advice given by practical nurses, which lack only classification and advertising to be raised into the dignity of cults.

The Buffalo News, of February 2nd, contains an illustrated page on "How Child Lives

Are Saved in City Dispensaries." The description is sanely written. Not a doctor or dispensary is mentioned, and no charge of advertisement or notoriety on account of the article can be made. The article is well calculated to inspire the people with confidence in the work done at the dispensaries. The opening words are "Slowly starving to death a little boy lay in a Buffalo hospital. He was not a hunger striker. He had the will to eat and live, but not the power. A sickness which the doctors call 'laryngeal diphtheria' had left him with throat muscles paralyzed." A brief description of the treatment ended with the words, "and he was discharged from the hospital—cured." Then follows a paragraph headed "True Appreciation," which tells how the "grateful parents spread the good news about the service at that hospital." Other sub-headings are:

"For the Children"

"Kindliness Rules"

"A Pitiful Family"

"Operations Not Rushed"

"Gaining Weight"

The article is an example of the best type of medical publicity, in the daily press, and is a model of the kind of articles which will promote confidence in the medical profession.

The Albany Telegram of February 3rd quotes an argument by Dr. Matthias Nicoll, Jr., State Health Commissioner, in favor of full-time county health officers. Dr. Nicoll says that county tuberculosis hospitals and nurses mark the beginnings of county units. The plan is that all the public health work in the county should be under the immediate direction of a county health officer with the present health officers of towns and villages as assistants. This plan is already authorized by Section 20-b of the Public Health Law, and has been adopted by Cattaraugus County. There is much to commend in the Commissioner's plan.

The Glen Falls Post of February 4th describes the organization of a nutrition class in the health center. The members of the class consist mostly of those who have attended the summer health camp and are still below normal in weight. The article notes the establishment of a similar class in Warrensburg.

The Poughkeepsie Star of February 4th records the action of the local lodge of Elks in purchasing a farm which is to be equipped and

conducted as a summer camp for under-nourished children, under the direction of the Dutchess County Health Association, and the Poughkeepsie Tuberculosis Committee. The folks held an indoor circus in the State Armory in aid of the project.

Two Rochester papers, the Journal and the Times-Union, of February 9th, each have a head-line "Ban Raw Meat, Advises City Health Officer," which herds comments on several health topics by Dr. George Goler, Health Officer. His advice against raw meat was called forth by the recent deaths of three persons from trichinosis. This disease is produced by tiny worms which are in pig meat, and may find their way into the muscles of persons who eat the pork, unless they are killed by the heat of cooking. The worms are frequently found in pork, but the American custom of thoroughly cooking pork prevents the spread of the disease to man.

The New York Evening Post of February 12th contains a description of the work of the New York Association for Improving the Condition of the Poor, and asserts that the needs of the victims of poverty are intelligently met in New York City. The organization spent nearly a million dollars in 1923. The relief consisted of money, nursing service, educational diets, anti-tuberculosis measures, and summer camps. Other forms of relief were given, according to the individual needs of the persons. This organization demonstrates practical methods of relief which lead to self-help, rehabilitation and prevention of the results of poverty.

The Olean Times of February 5th contains an account of a Mothers' Health Club which has recently been opened in the city as a part of the campaign to save the lives and health of infants. The work of the club is largely educational, and consists of instructing the mothers in the prevention of children's diseases, the proper feeding of children, and in instruction to the expectant mother, and general talks concerning the care of children.

The Niagara Falls Gazette of February 5th reports that more than seventy mothers residing in the north end of the city protested against the closing of the Child Welfare Clinic of that section. This clinic was closed on the recommendation of the Health Officer, Dr. Gulick, but it had evidently been found valu-

able by the mothers of children whom it served.

The Troy Record of February 7th contains an account of the reapportionment of the four administrative health districts of the city. The account goes on to state that several anonymous complaints about chickens had been received by the Board of Health and had been thrown into the waste basket. Rural problems of health administration seem to exist in Troy as well as in Yaphank and Speonk.

The Rochester Times-Union of February 7th carries a quarter column quotation from the Christian Science Monitor regarding the treatment of the city water with iodine for the prevention of goiter. We confess we do not know whether or not to take either paper seriously. The Monitor calls the iodine treatment a nefarious practice and makes reference apparently seriously, to the propaganda of the chemical manufacturers, to use prohibition for promoting the sale of iodine because the treated water was antiseptic and would not permit fermentation in home brews. If the article is intended as a joke, it should be labeled such, and placed in the PRUNE section.

The Binghamton Press of February 8th contains an account of the action of the Board of Health of Endicott in denying the petition of 568 signers to permit the sale of raw milk, Grade B, dipped from cans. Not one signer appeared and it was then shown that a dealer in that grade of milk prepared a petition and asked each buyer "Don't you want to be able to buy milk at 10 cents a quart? Well then put your name down here." The newspaper article says that there was no record that the petition was presented in the form "Don't you want the opportunity to have typhoid, or wouldn't you like the baby to chance a tuberculous spine? Well, then, put your name down here." The account states that the amount of milk sold by the low-grade dairy is only about one per cent of the supply of the city, and that the rest is either Grade A, or is pasteurized.

The Times, of Little Falls, of February 5th, records the appointment of Dr. A. B. Santry as health officer. It states that Dr. Santry is qualified for the position, having taken the course of instruction conducted by the State Department of Health. It also says "Dr. Santry is a Democrat, and the complexion of the Board is Democratic. The new official will succeed Health Officer Liverleigh, who is a Republican." Thus both politics inject itself where it is least wanted.

# NEWS NOTES

## THE MEDICAL SOCIETY OF THE COUNTY OF ONEIDA

The annual meeting of the Society was held in Hotel Utica, January 8, 1924

The following officers were elected President, G M Lewis, M D, Vernon, Vice-President, D E Pugh, M D, Utica, Secretary, W Hale, Jr, M D, Utica, Treasurer, H W Jones, M D, Utica, Librarian, T Wood Clarke, M D Utica Censors, G M Fisher, W B Roemer, E R Evans, D H Roberts, Andrew Sloan

The scientific program of the meeting was confined to the address of the Retiring President, Dr D H Roberts, who spoke at length and in minute detail of the work done in the field of obstetrics of the present day, and entered a plea for more study and scientific endeavors, with the view of lessening mortality rates of mother and child, and with the view of more healthy convalescence

Dr James N Vander Veer, Chairman, Legislative Committee of the State Society, addressed the meeting on the subject of current legislation, expressing the aims and hopes of the Committee. The Society by vote unanimously supported the work as outlined by Dr Vander Veer

The chairman and members of the County Society who worked so faithfully last year were all reappointed by Dr Lewis

## MEDICAL SOCIETY OF THE COUNTY OF ALBANY

The regular meeting of the Medical Society of the County of Albany, held on February 12, 1924, at the auditorium of the Municipal Gas Company, 124 State Street, Albany, N Y, was opened by Dr Edgar A Vander Veer, President. Thirty-seven members of the society were present

The Society went on record as being in favor of a reduction of the yearly tax paid by physicians under the Harrison Narcotic Law, furthermore, it was resolved that the Secretary of the society should be instructed to communicate such action to the Committee on Ways and Means, House of Representatives, Washington, D C

Dr Nelson K Fromm, chairman of the Health Committee, reported on the educational drive

which is being organized, to teach the laity the necessity for early medical attention to prevent the progress of cancer

Dr James M Archibold, Cohoes, N Y, was elected to membership, Dr Matthias Nicoll, Jr, of Albany, was received on transfer from the Medical Society of the County of New York

### *Scientific Program*

"The Surgical Treatment of Trigeminal Neuralgia," John Gutman, M D Discussion opened by Nelson K Fromm, M D

"Artificial Pneumothorax in the Treatment of Pulmonary Tuberculosis," W E Lawson, M D Discussion opened by Richard H Morgan, M D, Mt McGregor Sanatorium

"Hydrochloric Acid in the Treatment of Diabetes Mellitus," Thomas Jenkins, M D Discussion opened by E Martin Freund, M D

## MEDICAL SOCIETY OF THE COUNTY OF NEW YORK

There will be a special meeting of the Medical Society of the County of New York at the New York Academy of Medicine, Thursday, February 28, at 8 30 P M, for the purpose of considering and taking action on the bill requiring annual registration of physicians now before the Legislature

## THE WOMEN'S MEDICAL SOCIETY OF NEW YORK STATE

The Women's Medical Society of New York State will convene in Rochester for its annual meeting, on Monday, April 21st. The sessions will be held in Hotel Seneca

Dr Louise Hurrel, chairman, committee of arrangements, and Dr Marion Craig Potter, chairman, committee of program, assures us a splendid meeting

The State medical program, both scientific and social, promises to be one of the best we have ever had. So be sure and plan to attend both the Women's State and the State Medical meetings

Please write and engage your reservations at the Hotel Seneca immediately.

## BOOK REVIEWS

**OPTOTYPES, CONSISTING OF TEST LETTERS AND PICTOGRAPHS FOR MEASURING THE ACUTENESS OF VISION** By JOHN GREEN, M.D., LL.D., Professor Ophthalmology St. Louis Medical College, 1886 to 1913 and A. E. EWING, A.M., M.D., Professor Emeritus Ophthalmology in Washington University. Thirty five en gravés plates. C. V. Mosby Co. St. Louis 1923

This is a pamphlet of 24 pages, the foreword and first two sections written by Dr. JOHN GREEN before his death in 1913 the other two sections by Dr. A. E. EWING. It describes briefly a new form of chart for vision testing varying from the test letters of Snellen in form making for greater legibility and in the greater elaboration of the geometrical progression.

Accompanying the pamphlet are two sets of Optotypes, the first consisting of eleven charts, printed on both sides with a wide variety of test letters, and the other of six charts, also printed on both sides with pictographs for use with children and illiterates.

Completely to comprehend this brief and rather technical work, a good working knowledge of physiological optics and familiarity with other work along these lines are essential.

E. CLIFFORD PLACE.

**CURES** By JAMES J. WALSH, M.D., Ph.D., Sc.D. Professor of Physiological Psychology Cathedral College and College of the Sacred Heart (Manhattanville) New York City, Extension Professor Fordham University. D. Appleton & Co., New York 1923

The author goes far back into medical history and tells the story of "cures" that have failed. All of these "cures" cured for a time but eventually lost their popularity and then cured no more. They owed their value not to any peculiar inherent properties but to their effect upon the patient's mind. Clever substitutes were just as curative. The book was not written with the idea of eradicating the delusions, but rather with the purpose of getting a laugh at the humorous ways of human nature.

This volume will be read with considerable profit as well as entertainment by the profession and the laity alike. It brings home with a punch the fact that an unproved cure even though they number in the thousands, are never to be taken as evidence of the value of a new method or mode of treatment.

The association and comparison of psychoanalysis with Couéism appears to the reviewer to be ill founded and unfortunate. It is about as logical as likening a chicken to a centipede on the ground that each has more than one leg. The amazing statements are made that "psychoanalysis finds the root of all neurotic ill in sex repression" and that "Philadelphia and New York have taken a decided stand through representative neurologists against psychoanalysis." This chapter lacks the smooth, impartial treatment of the rest of the book. Nevertheless, it furnishes us with a laugh at the humorous ways of human nature but at whose expense, this time?

FREDERIC DAMEAU

**ESSENTIALS OF SURGERY** A Text Book of Surgery for Students and for Those Interested in the Care of the Sick. By ARCHIBALD LEETE McDONALD, M.D. Lecturer on Surgery Nurses Training School, St. Luke's Hospital, Duluth, Minn. 49 Illustrations. Second Edition, Revised. J. B. Lippincott Co., Phila. and London 1923

This second edition of this work originally brought out in 1919, is one of Lippincott's Nursing Manuals contains 288 pages and 49 illustrations follows the same scheme as the earlier edition in presenting surgical lesions in a general way and the indications for treatment but does not attempt to include operative technique.

It is intended for the senior student nurse who has knowledge of the fundamentals anatomy physiology and bacteriology and it covers the field very fully although not going into minute details. It presents the etiology pathology, and general principles to be considered in treatment but does not discuss technical nursing methods. There are three opening chapters on bacteria, local infections and the effects of specific bacteria. Then follow tumors wounds, hemorrhage, surgical operations and anesthesia bones and articulations vascular lymphatic and nervous systems. The surgical lesions of the different anatomical regions are then considered, and this has been completed in this edition by including a new chapter on gynecological lesions. A very useful glossary which is quite up to date completes this volume which is indeed a very satisfactory text book for the student nurse, and should be in the hands of every Graduate nurse as well. W. B. P.

**THE EXAMINATION OF PATIENTS** By NELLIS B. FOSTER, M.D. Octavo volume of 253 pages, illustrated. Philadelphia and London, W. B. Saunders Company 1923. Cloth \$3.50

This volume is written to review and impress upon the minds of students and practitioners the important clinical factors in physical diagnosis. The author emphasizes the necessity of observation and deduction from the patient, and the use of the laboratory and X-ray as adjuncts to diagnosis. The method of taking and the importance of a good history is emphasized. Each system is taken up for study with the important clinical factors to be considered. This will prove a useful book for practitioners to review their methods of examination of patients. H. M. M.

**INTERNATIONAL CLINICS** A Quarterly of Illustrated Clinical Lectures and especially prepared original articles on Treatment Medicine, Surgery, Neurology, Pediatrics, Obstetrics, Gynecology, Orthopedics and other topics of interest to students and practitioners by leading members of the Medical Profession throughout the world. Edited by HENRY W. CATTELL, A.M. Vol. II, Thirty third Series, 1923. J. B. Lippincott Co., Philadelphia and London.

This issue of a long-established publication would seem to be of unusual interest and merit. Perhaps the most opportune and attractive articles are those on Insulin four in number, by Banting and McPhedran of Toronto, Seale Harris of Birmingham Alabama, Hamburger of Baltimore, and Petty of Indianapolis. The international aspect of the volume is furnished by W. Storm Leeuwen of Leiden Holland, on Allergic Diseases, by James Burnet of Edinburgh, Scotland, on Chorea, and by Charles Greene Cumston of Geneva Switzerland, on Problems in Surgical Diagnosis, Pathology and Treatment.

The other articles are well written on well chosen subjects by well known clinicians. Consequently the entire text is well balanced and furnishes instructive as well as interesting reading. W. H. D.

**A TEXT-BOOK OF THERAPEUTICS INCLUDING THE ESSENTIALS OF PHARMACOLOGY AND MATERIA MEDICA** By A A STEVENS, A.M., M.D. Sixth Edition, entirely reset Octavo of 793 pages Phila and London W B Saunders Company, 1923 Cloth, \$6.25

This, the sixth edition of Dr Stevens' well known work, has been brought up to date and provides one of the most useful text books on this subject. It is concise, readable, sufficient and altogether a valuable addition to the practitioner's library. The section on "Applied Therapeutics" is lucid and in conformity with the best modern thought. It would be interesting to compare the "Treatment" of today with that advised by Dr Stevens in the first edition of his Therapeutics.

M F DEL

**OBSTETRICS FOR NURSES** By CHARLES B REED M.D., Obstetrician to Wesley Memorial Hospital, Chicago 144 Illustrations, two Color Plates C V Mosby Co., St. Louis, 1923 \$3.50

As a general text-book for nurses, easy of comprehension, clear and concise, this second edition will find a logical usefulness.

One of the nice features of the book is a detailed summary of important points brought out in each chapter, giving the nurse, therefore, in a few words not only a resume of the preceding chapter, but detailed instructions.

The book is well written, on good paper, with a considerable number of illustrations which might be improved upon.

G W P

**PRINCIPLES OF BACTERIOLOGY** By ARTHUR A EISENBERG, A.B., M.D., Director of Laboratories, St. John's Hospital, Pathologist to Lakewood Hospital Second Edition C V Mosby Co., St. Louis, 1923 Price \$2.25

This book contains the essential facts of bacteriology. The subject is covered clearly and concisely. Being intended for nurses, it might be criticized from the point of view that a number of descriptions, tests and technique have been added which as yet have not been universally accepted.

The little volume, as a whole, however, should make a useful addition to the nurses' library.

MAX LEDERER

**THE NORMAL CHILD, ITS CARE AND FEEDING** By ALAN BROWN, M.B., Physician in Chief, Hospital for Sick Children, Toronto, Associate Professor of Medicine in charge of Pediatrics, University of Toronto Century Co., New York, 1923 Price \$1.25

In order to recognize and successfully attack abnormalities or disease one must first acquaint himself with normal standards. It has always seemed paradoxical that in most of the medical schools of this continent so much time should be spent by the student in learning the normal anatomy, histology and physiology of the adult body before being permitted to study or attempt to treat diseased conditions, whereas, in the case of the infant and child, the curriculum plunges this same student directly into the study of the abnormal. If preventive medicine is to accomplish its object successfully it must begin with the child, and here no detail is too small or insignificant to deserve attention. The texture of the clothing, the temperature of the bath, the material and shape of the shoes, as well as the diet, should be given careful consideration. While this book is avowedly concerned with the normal child, nevertheless chapters are devoted to common diseases and to diet in illness. The illustrations are somewhat crude, seeming to be made from wood cuts, but the language and style are simple and the arrangement and paragraphing commendable. There is ample room for many more such simple handbooks such as this on the study of the normal child.

WM HENRY DONNELLY

**PHYSICAL DIAGNOSIS** By RICHARD CABOT, M.D., Professor Medicine, Harvard University Formerly chief of the West Medical Service at the Massachusetts General Hospital Eighth Edition Revised and Enlarged, six plates, 279 figures in text William Wood and Co., New York, 1923 Price \$5.00

There has been a complete resetting of the previous editions to bring this work up-to-date. Each chapter has been enlarged upon, especially the one on cardiac arrhythmia. About twenty new and helpful illustrations and X-ray pictures have been added. A printer's error, which should be corrected in future editions, appears on page 159, line 11, where Fig 86 should read Fig 81.

For aids in diagnosis, every physician and student will profit by reading this admirable work.

A T MAYS

**THE HEART ITS PHYSIOLOGY, PATHOLOGY AND CLINICAL ASPECTS** By SELMAN NEUBOF, B.S., M.D., Visiting Physician, Central and Neurological Hospitals, Consulting Cardiologist, Broad Street Hospital, P. Blakiston's Son & Co., Phila, Pa., 1923 Cloth \$10.00

The author has presented in a volume of 700 pages all that can be presented concerning the heart which is of practical value to the physician. The anatomy and physiology of this organ are clearly and concisely given. The causes of diseased conditions are explained. Methods in addition to clinical ones are thoroughly reviewed and due weight given to them. Abnormal conditions are explained together with the modes of prevention and treatment. This work is one that should be used by everyone who treats patients with cardiac conditions, as it presents the subject in as clear a manner as any of the recent publications on the care of the heart. Typographically the work is excellent.

H M M

**CONSTRUCTIVE CONSCIOUS CONTROL OF THE INDIVIDUAL** By F MATTHIAS ALEXANDER, Author of "Man's Supreme Inheritance," with an introduction by Prof John Dewey E P Dutton & Company, New York 1923

This book is a sequel to "Man's Supreme Inheritance." "It deals with Sensory Appreciation in its four aspects in relation to man's evolutionary development, in relation to learning and learning to do, in relation to man's needs, and in relation to happiness."

The subject matter defies analysis. To read the book is to play mental tag. We find ourselves just on the point of coming to some conclusion on an important educational topic, when the author hurriedly departs for Versailles on an errand of psychological castigation of the Peace Conference, and by the time our slower mental transportation has carried us thither, he has completed a tour around the world.

FREDERIC DAMRAU

**HABITUAL CONSTIPATION. ITS CAUSES, CONSEQUENCES, PREVENTION AND RATIONAL TREATMENT** By ISMAR BOAS, M.D., Translated by Thomas L. Stedman M.D., 12 Mo Cloth, 299 pages \$2.00 net N Y, Funk & Wagnalls Company, Publishers 1923

This is a book for the laity written in non-technical language, and covers the whole field of constipation in the typical German manner. Every possible cause of constipation and the measures for its relief are described. While careful perusal of its pages would be interesting to a sufferer from constipation, allusions to the many diseases which might be the causes of his trouble, would make a neurasthenic of many a layman. The many and varied suggestions for treatment would also mislead rather than help. A smaller and less detailed treatise on this subject would have been more desirable.

A F R A

**A MANUAL OF PROCTOLOGY** By T. CHITTENDEN HILL, Ph.D., M.D. 12 mo of 279 pages with 84 engravings Phila and New York Lea & Febiger 1923 Cloth \$3.25

The author presents a book on the common colonic and rectal diseases eminently suitable for the use of the general practitioner. His suggestions are replete with practical personal views which make the book more valuable than many larger volumes on the subject.

The book is well written and most attractive in the easy manner of describing the details of his subject. He has fulfilled his object in writing a concise masterly small book free from irrelevant material.

MARTIN L. BODKIN

**RHUS DERMATITIS FROM RHUS TOXICODENDRON RADICANS AND DIVERSILOBA (POISON IVY) ITS PATHOLOGY AND CHEMOTHERAPY** By JAMES B. MCNAIR, Octavo of 298 pages, illustrated. Chicago The University of Chicago Press, 1923. Cloth, \$4.00

This book is a most exhaustive and authoritative study of Rhus Toxicodendron L., Rhus radicans L. and Rhus diversiloba T. and G. The author gives a very accurate botanical description of the plants, particularly of Rhus diversiloba with its morphology and anatomy. This alone makes the book exceedingly valuable. The chapter on the chemistry of the poisonous principle treats of the work of many investigators beginning with that of Du Roi in 1788 and ending with McNair in 1916, giving in detail the various chemical methods employed by them in determining the cause of ivy poisoning.

The chapters on the pathology, differential diagnosis, internal poisoning and immunity are interesting and instructive.

However exhaustive as this work is no mention is made of the recent studies of this subject by Strickler and his antigen treatment which has proven so successful. Through this omission the book loses much of its value, for it is the treatment and prompt cure of this skin malady that interests physicians mostly rather than the botanical characteristics and chemical properties of the offending plants.

FREDERICK SCHROEDER.

**A MANUAL OF THE PRACTICE OF MEDICINE** By A. A. STEVENS, A.M., M.D. Eleventh Edition. Entirely Reset. 12 mo volume of 645 pages illustrated. Phila and London W. B. Saunders Co., 1923. Cloth \$3.50

This Manual, prepared especially for students has proven of value to many others. The fact that this edition is the eleventh shows that it contains much of value. The author has carefully presented the essential facts concerning conditions met in the practice of medicine. In addition to the usual medical disorders the author presents a complete review of the diseases of the skin. The book is concise and accurate, and for one who does not care to go thoroughly into the different treatments of disease it will be found useful. As a manual it is all that could be desired. H. M. M.

## BOOKS RECEIVED

Acknowledgment of all books received will be made in this column, and this will be deemed by us a full equivalent to those sending them. A selection from these volumes will be made for review as dictated by their merits, or in the interest of our readers.

**MOVEMENT IN ORGANIC DISEASE** by ERNEST KINGS COTE, M.B., C.M. Edit. Hon. Physician St. Pancras Dispensary. William Wood and Co., New York, 1924. Price \$3.50

**FEDERAL INCOME TAXES. PRINCIPLES AND PRACTICE**, by E. T. ROSSEMOORE, B.S., Certified Public Accountant (New York), Chief of the Consolidated Returns Section and Lecturer on Income and Profits Taxes in the Bureau of Internal Revenue, 1922. D. Appleton and Co., New York and London 1924

**A COMBINED TEXT BOOK OF OBSTETRICS AND GYNECOLOGY** by J. M. MUNRO KERR, M.D., F.R.C.P., and S. (Glas.) Professor of Obstetrics and Gynecology Glasgow University, JAMES HAIN FERGUSON M.D., F.R.C.S. (Edin.) Gynecologist Royal Infirmary, Edinburgh, JAMES YOUNG, D.S.O., M.D., F.R.C.S. (Edin.) Assistant Physician, Royal Maternity Hospital Edinburgh, JAMES HENDRY, M.A., B.Sc., M.B. Senior Assistant Murchison Professor, University of Glasgow. William Wood & Co., New York, E. & S. Livingston Edinburgh, 1923. Price, \$10.00

**MODERN METHODS IN THE DIAGNOSIS AND TREATMENT OF HEART DISEASE**, by FRANCIS HEATHCOTE M.B., B.S. (Lond.) F.R.C.S. Temp. Capt. R.A.M.C. superintendent heart clinic Manchester. Cardiologist to the Ministry of Pensions. William Wood and Co. New York 1923. Price, \$2.00

**HEALTH AND DISEASE, THEIR DETERMINING FACTORS** by ROGER I. LEE, M.D., Professor of Hygiene in Harvard University. Visiting Physician, Massachusetts General Hospital. Little, Brown and Co., Boston 1923.

**THE MOTHERCRAFT MANUAL**, by MARY L. READ, B.S., illustrated. Little, Brown and Co., Boston, 1922

**HEALTHY CHILDREN** A Volume Devoted to the Health of the Growing Child, by S. JOSEPHINE BAKER, M.D., D.P.H. Little, Brown and Co. Boston 1923. Price, \$1.25

**HEALTHY BABIES** by S. JOSEPHINE BAKER, M.D., D.P.H., Director Bureau of Child Hygiene, Department of Health, New York City. Little, Brown and Co., 1923. Price \$1.25

**HEALTHY MOTHERS** by S. JOSEPHINE BAKER, M.D., D.P.H., Director Bureau of Child Hygiene, Department of Health, New York City. Little Brown and Co., 1923. Price, \$1.25

**THE HYGIENE OF MARRIAGE**, by ISABEL EMISJIE HUTTON M.D., with foreword by Prof. A. LOUISE McILROY M.D., S.Sc., O.B.E. William Henemann, London 1923

**HANDBOOK OF ANAESTHETICS**, by J. STUART ROSS, M.B., Ch.B., F.R.C.S.E. Lecturer in Practical Anaesthetics, University of Edinburgh. Second Edition. William Wood and Co., New York. Price, \$2.75

**INDUSTRIAL HEALTH**, edited by GEORGE M. KOBER, M.D., LL.D., Washington D.C. and EMERY R. HAYHURST A.M., M.D., Ph.D., Columbus Ohio. 33 contributors illustrations reference tables and appendix. P. Blakiston's Son & Co. Philadelphia, Pa., 1924

**INTERNATIONAL CLINICS** A Quarterly of Illustrated Clinical Lectures and especially prepared Original Articles, by leading members of the Medical Profession throughout the World. Vol. IV Thirty third Series, 1923. J. B. Lippincott Co., 1923

**THE PRIMARY PROBLEMS OF MEDICAL PSYCHOLOGY, A TEXT BOOK FOR STUDENTS AND PRACTITIONERS**, by Dr. CH. DEMONTET Professor of Medical Psychology at the University of Lausanne. Translated by A. NEWBOLD. William Wood and Co. New York, 1923. Price \$2.50

### Try to Laugh This Off!

It is astounding that this great American nation, slave though it is to luxurious habits, can retire to its bed night after night, failing utterly to realize one of its most glaring forms of wastefulness. Isn't it?

We are informed rather reliably that the population of these more or less United States is on the verge of 120,000,000 souls. Of these 90,000,000 or more acquire during the course of a year ailments of sufficient importance to justify the advice of a physician. This means that at least 86,000,000 prescriptions (alcoholic documents excluded) a year are issued to maintain the national health.

But this is not waste, you will say at once. And you will be right. But wait! The waste lies in the fact that *not more than one-fifth of any prescription is ever consumed!*

Suppose one is ill. Very well. One's prescription is to be disposed of, according to directions, at the rate of a teaspoonful in one-fourth glass of water after meals and at bedtime. The druggist, generous soul, never fails to compound a sufficient quantity to accommodate an illness of some two weeks' duration.

What happens? After two days—three at most—the patient is feeling so much better that he decides to forget his medicine and eat a welsh rarebit or a lobster salad instead. The vial of medicine continues to occupy a sticky place on a shelf above the kitchen sink for a month, subsequently going to the medicine chest in the bathroom to join a dozen others of its kind, each of which is a monument to the memory of some dear departed ailment, nipped in the bud, as it were.

Think of it, fellow-Americans! Seventy-five million bottles, each containing at least \$2.80 worth of glorious, health-restoring fluid, representing the blood-chilling total of \$230,000,000! A bottle of medicine, once discarded, never is resumed, despite good intentions. And the bottles themselves! Laid end to end—my goodness—what a distance and back they would reach!

Cannot something be done to remedy this frightful situation? Something can. One suggestion is the establishment of medicine exchange bureaus in every hamlet town and city in the United States. The system will work out something like this:

You, for instance, have paid \$3.50 for a concoction prescribed for a rheumatic attack. Your neighbor has subscribed an equal amount for something good (or bad) for a touch of something or other. His neighbor and his neighbor's neighbors have bottles of drugs for indigestion, sore throat, dandruff, etc.

Let each patient upon recovery take his remaining medicine to the nearest clearing house, where he will be tendered a receipt for same. When next he accumulates a physical disorder, he visits his physician in due and ancient form, but instead of going to the druggist for his medicine, he stops at the exchange, obtaining just what he needs, and paying only a nominal fee for service.

Bah! you will say. Second-hand medicine! Well, what of it? It's being done with automobiles and everything else. So why not?

But perhaps you prefer to eliminate the middleman, in which case the transaction can be handled nicely by classified ad. For instance

EXCHANGE—Gentleman, just recovered from general break down, will exchange his medicine, used only a short time, for good, reliable cold in the nose remedy. Box 777, The Evening Enquirer.

Or why not sell it outright, like this

FOR SALE—Good all round collection of tonics, prescribed by one of the city's most expensive physician. Perfect condition. Bargain if you act quick. Phone Heinz 57 and ask for Al.

—John W. Kraft, Judge

### Anything in Drugs

SCENE. A modern city drug store, any time. The manager stands at the front of the store, ready to greet customers.

Enter, Mr. Jones (in a great hurry)

Manager. Can I serve you?

Mr. Jones. My car has stopped. I think it needs a new spark plug. Can I get one here?

Man. Certainly, sir. Right this way.

Enter, Mr. Smith.

Man. Can I help you, sir?

Mr. Smith. I want a flashlight battery.

Man. Yes, sir, etc.

Enter, Mrs. Wiggs.

Mrs. Wiggs. I see you are advertising aluminum cooking utensils.

Man. Yes, madam. Right over there.

Enter, Miss Jiggs.

Miss Jiggs. I want a good book to read and a nice box of candy.

Man. This way, please.

Enter, Mr. Brown.

Mr. Brown. May I leave some films to be developed, and prints made?

Man. First counter to the left, sir.

Enter, Miss Green.

Miss Green. Can I get a rubber swimming cap here?

Man. Yes, indeed. This way.

Enter, Mrs. Black.

Mrs. Black. I'd like to get some postage stamps and stationery.

Man. Right this way, madam.

Enter, Mr. White.

Mr. White. I want some castor oil.

Man. Yes, sir. One-in-Three is very good. Right—

Mr. White. No! No! Some castor oil for a sick little boy.

Man (dumbly). Castor oil?

Mr. White. Yes! Castor oil.

Man. Just a minute, please. (Confers with assistant.) We don't have castor oil, sir. Perhaps an electric vibrator would help the boy.

Mr. White (exiting in a huff). Or a vacuum cleaner.

Man (humming).

Yes, we have no drugs,

We have no drugs today.

We have cold creams and sodas,

Ma-GA-zines and razors,

And all kinds of drinks, and say,

We have a large stock of CIGARS.

And a truck full of can-DY bars,

But, yes, we have no drugs,

We have no drugs to-day.

## THE CAUSE AND PREVENTION OF THE COMMUNICABLE DISEASES OF CHILDHOOD \*

By CHARLES HERRMAN, M D

NEW YORK CITY

I SHALL limit my remarks to the more important communicable diseases of childhood but before taking them up separately, I shall briefly discuss some questions which are common to all

*Aq. Incidence* Infants under six months enjoy a relative immunity to several of the communicable diseases. This is a passive immunity transmitted from the mother to the fetus through the placental circulation, and gradually disappears so that by the end of the first year and thereafter infants and young children are very susceptible to these infections. In human beings little or no specific immunity is due to the passage of antibodies through colostrum or breast milk, so that artificially as well as breast fed infants enjoy this passive immunity. The advantages of breast as against artificial feeding probably depend on the fact that cow's milk as a foreign substance has a slightly injurious effect on tissue cells, so that they are less able to respond in a normal manner in resisting and overcoming infection. From the first to the fifth year, infants and young children may be considered as most susceptible for the initial passive immunity has disappeared and immunity has not yet been acquired by exposure. In the Schick test we have a simple and valuable method of demonstrating the presence of the initial passive immunity and the gradual appearance of an acquired immunity. However, aside from a humoral or blood immunity, there are apparently other factors, for a diphtheria carrier with a positive Schick reaction may not develop diphtheria. We must therefore assume a cellular immunity as well. Adults are not often infected primarily because they have had the disease in childhood and one

attack protects against future attacks. However, adults who have lived in isolated places, and have not been exposed to infection are almost as susceptible as children. A mild attack, especially in early infancy, may be overlooked. I believe this is the explanation of Sellard's negative results in the experimental inoculation of measles in adult volunteers who were supposed never to have had measles.

*Sex* In a few diseases one sex seems predisposed. For example, the incidence of whooping cough is greater in females. Although the respiratory symptoms are more spectacular, whooping cough is essentially a disease of the nervous system. A few other diseases of the nervous system, notably hysteria and chorea, are also more frequent in females. This may be associated in some way with gonadal activity.

*Seasonal Incidence* For the purpose of study measles presents the most favorable conditions. All persons over five months of age who have not had the disease are susceptible and contract it on exposure. The characteristic symptoms appear with mathematical precision after a definite period of incubation. In New York City diphtheria and scarlet fever are reported with a fair degree of accuracy, about 25 per cent of all cases of measles are reported, and about 10 per cent of all cases of whooping cough, but as the percentage of all cases of these diseases which are reported remains about the same, the curves of seasonal incidence based upon the number of cases reported is fairly accurate.

*Chart* It will be seen that in those years in which measles is epidemic, the number of cases is far in excess of all the other communicable diseases, and that in New York City measles is epidemic every second year. This is probably

due to the fact that in an epidemic year such as 1922, large numbers of susceptibles are infected, so that a comparatively small number are left for the succeeding year, time being required for a certain amount of inflammable material to accumulate so that there shall be a large number of foci of infection. This is rendered probable by the fact that in small towns such epidemics only occur every third, fourth or fifth year. However, the most remarkable fact is that such epidemics in New York City almost always occur in May. In looking over the meteorologic reports, I could find nothing in the temperature, humidity, rainfall, sunlight, or winds, which was characteristic of May as against the other months of the year. In almost all the communicable diseases of childhood, the infectious material is present in the rhinopharynx, and this is also the point at which the infectious material enters the body. Some years ago Amoss and Taylor showed experimentally that the nasal mucous membrane of most individuals had the power of neutralizing or inactivating the virus of poliomyelitis. This protective mechanism is apparently more or less developed in different individuals and is probably deficient in the 2 per cent of individuals who are susceptible to poliomyelitis. During the epidemic of 1916 we also noticed that those patients who contracted the disease were more

susceptible to ordinary nasal catarrh. However, the susceptibility to measles is universal, there are cases in New York City at all times, so that opportunity for infection is always present. We must, therefore, assume a special susceptibility in May. It is possible that at that season the nasal mucous membrane is in some way sensitized to the measles virus very much as persons have their attacks of hay fever and June cold at certain definite seasons. I have notes of three cases in which children exposed to measles in the fall and winter failed to contract the disease, and subsequently became infected in April and May. Although three cases are insufficient from which to draw any conclusion, the fact is at least suggestive. As a rule climatic conditions are supposed to increase the virulence of the infectious material, and in that way cause epidemics at certain seasons, however, it is also possible that *individuals* differ in susceptibility at different seasons. One naturally thinks of an increased or diminished activity of the endocrine system. In animals, moulting, mating, and hibernation are periodic phenomena, probably dependent upon such changes. It has been shown that in man the blood chemistry varies at different seasons. It would be interesting to compare the seasonal incidence of the communicable diseases as they occur in countries having seasons radically dif-

ferent from our own. It might be worth while to test similar groups of children and to note whether there was any difference in the percentage of positive Schick reactions at different seasons.

I think there can be little doubt that children with hypertrophy of the lymphoid tissue of the rhinopharynx are more susceptible to these infections and that the disease is more likely to run a severe course in them. We have noticed that nearly all our scarlet fever patients show such lymphoid hyperplasia. However, this may be only one manifestation of a lack or deficiency of ability to cope with infections in general, rather than the cause of susceptibility, for many children, even after the removal of hypertrophied tonsils and adenoid vegetations, still continue to be susceptible.

Almost all the communicable diseases are spread by direct contact with patients, not through inanimate objects. As sanitarians we should emphasize the manner in which the communicable diseases are usually spread, not how they may be occasionally spread. Although rooms, clothes, books and foodstuffs may be responsible in exceptional cases, for the most part they are negligible. Measles, chickenpox and possibly grippé may be air-borne at a short distance through air currents, in the other diseases close contact is essential. It is therefore important that children should be taught the proper use of the handkerchief at an early age. In hospitals for children, there should be an observation ward in which new patients may remain for two weeks before being admitted to the general ward. In the general ward the beds should be separated by a partition or there should be a distance of at least 4 feet between them. Cross infections are much more easily prevented if all patients are kept in bed until they are sent home. All patients who cough or sneeze should be isolated. Whenever isolation and proper care can be obtained at home, removal to a hospital should not be advised. As infection does not occur from rooms occupied by a patient, disinfection is unnecessary, a thorough airing and cleaning are sufficient. The spread of the communicable diseases is difficult to control because there are large numbers of mild unrecognized cases and carriers, and because they are most communicable in the early stage, before their true nature is recognized. Even if it were possible to detect all the mild cases and carriers, it would be impossible to isolate them.

**Immunity** Good health does not necessarily go hand in hand with immunity to the infectious diseases. In the late war only those men were selected for service who were free from organic

disease, and were therefore healthier than the average male adults in the community, however, when they were infected with measles, influenza, or pneumonia many showed a distinct lack of the normal defense reactions. The susceptibility or resistance to the infectious disease seems to depend on certain hereditary qualities, and is probably specific for each disease. It has been noted by Zingher that when the youngest child in a family has a negative Schick reaction, all the older children usually have a negative Schick reaction also. This would seem to indicate that the ability to develop antitoxin acts as a dominant character. It is probably this ability to form antibodies which is on a hereditary basis. It would be interesting to note whether those children who continued to have a positive Schick reaction in spite of two or more series of injections with the toxin-antitoxin mixture, were also more susceptible to infection with the other communicable diseases of childhood as shown by their previous history.

**Measles** The infectious material is present in the rhinopharyngeal mucous discharge, and in the blood, from the appearance of the catarrhal symptoms until the completion of the eruption, and the disease is communicable only during that period. An isolation of one week is therefore sufficient. The disease is spread by direct contact usually early in the catarrhal stage, a very short exposure being sufficient. Occasionally infection occurs at a short distance through a third person or through air currents. Mild atypical unrecognized attacks in young infants are sometimes responsible for the spread of the disease. One attack usually protects for life. A history of two or more attacks is probably based on an incorrect diagnosis. The spread of the disease can only be prevented if the patient is isolated when the first symptom appears, namely, a slight rise in temperature. After the catarrhal symptoms have appeared isolation is of little or no value, susceptibles who have been exposed have been already infected.

Prophylactic injections with convalescent serum confer a *passive* immunity. One week after defervescence from measles, from 60 to 80 c.c. of blood is withdrawn from a healthy child over three years of age. The serum is separated, a small portion is subjected to the Wassermann test, and a little tricesol as a preservative is added to the remainder. The serum of several patients is mixed and the material is kept in sealed vessels. For prophylactic inoculation from 3 to 6 c.c. of the serum is injected intramuscularly not later than four days after exposure to infection. The chief objection to this method is that it confers a *passive* immunity which lasts only about eight weeks, and that it is not absolute even for that

length of time. Its application and usefulness is limited to institutions for the care of young children. Its use will not solve the problem of controlling the spread of measles in the community. The situation is similar to that of diphtheria. Antitoxin injections will prevent diphtheria in children *known to have been exposed*, but it has not solved the diphtheria problem. This has been done through *active immunization* with the toxin-antitoxin mixture. My own method of conferring active immunity depends on the following. Seventy-five per cent of all deaths from measles occur in infants under two years of age. Any method of immunization which aims to control this disease must be employed in early infancy on all or nearly all children. Infants whose mothers have had measles are relatively immune during the first five months of life. The infectious material is regularly present in an active form in the nasal discharge from twenty-four to forty-eight hours before the eruption appears. It is not necessary to isolate or to identify the infectious material, or to obtain its growth in pure culture in order to immunize against the disease. In practice the infectious material is conveyed from the nasal mucous membrane of the patient to the nasal mucous membrane of the child infected. The immunizing inoculation follows the same path, the nasal discharge of the patient free from other disease is taken from twenty-four to forty-eight hours before the appearance of the eruption, and is mixed with a small quantity of normal saline solution, the bacteria and other extraneous material are separated by centrifugalization, and a few drops of the solution are applied to the nasal membrane of the infant to be immunized. *Only healthy infants between four and five months are inoculated.* The method endeavors to convert a temporary relative immunity into an active immunity which persists for at least two years, that is, during the most dangerous period. The best results are obtained when a reaction follows the inoculation, a slight rise of temperature on the eighth to the sixteenth day, occasionally a few spots on the face or trunk. It is therefore important to inoculate as near as possible to the end of the fifth month. In order to render the immunity more certain and lasting, I believe it would be advisable to reinoculate in the sixth and seventh months. I have inoculated 165 infants without a single unfavorable or injurious reaction. Forty-five of those inoculated have been directly exposed to infection without contracting the disease. None of those showing a definite reaction following the inoculation have contracted the disease, and thirty-six who were reinoculated after an interval of at least six months, did not develop the disease.

*Scarlet Fever* The character of the infectious material has not been definitely determined, as it is difficult to produce the disease experimentally by the inoculation of the rhinopharyngeal secretions. In addition to the virus a certain predisposition seems necessary, so that only a small percentage of exposed children contract the disease. Burns and open wounds of all kinds furnish such a predisposition. It is most communicable in the early stage, and is to a great extent spread through mild unrecognized cases and carriers, persons who have only an angina. The desquamating scales do not carry the infection, and "return cases" are probably due to carriers or patients who still have infectious discharges. Although an isolation of four or five weeks is necessary in most cases, in mild cases free from discharge, the period of quarantine could be shortened.

Attempts have been made to protect children against infection with scarlet fever by injecting convalescent serum. It is much more difficult to demonstrate its value than in measles, because while susceptibility to measles is almost universal, only about one-fourth of those exposed contract scarlet fever. From 15 to 30 c c of convalescent serum is injected into the child as soon as possible after exposure to infection.

*Whooping Cough* In true cases the Bordet-Gengou bacillus is pretty regularly present in the bronchial mucus in the catarrhal stage, and disappears after the fourth week of the disease, so that there is practically no danger of communicating the disease after that time, even if a spasmodic cough is still present. The disease is spread chiefly in the catarrhal stage, by direct contact, and mild atypical attacks in infants and adults may be responsible for the spread of the disease. As the disease is most communicable before the characteristic whoop is present, isolation to be effective must be carried out early. Where there is a history of exposure and when the disease is epidemic, every cough should be looked upon with suspicion. This is particularly true in hospital wards. As the disease is extremely serious in newborns, they should be protected from exposure. If the mother is exposed and has not had the disease, the close contact in nursing may be dangerous. I have seen several fatalities due to a failure to realize this danger. The only real isolation is isolation in bed. The wearing of a distinguishing band on the arm has not been a success, for the simple reason that children will not wear them. Mothers of susceptible children, especially infants, must be warned of the danger of exposure to infection.

The prophylactic injections of pertussis vaccine have not been uniformly successful. The introduction of any foreign protein seems to have some value in stimulating the formation of anti-

bodies. Recently I have used typhoid vaccine with about as good results as I obtained with the use of pertussis vaccine. In general the mother's blood would probably be the best for this purpose. The quantity necessary is small and easily obtained and it is not necessary to give it intravenously.

**Diphtheria.** The disease is regularly associated with the presence of the Klebs-Loeffler bacillus, but negative cultures may occasionally be obtained if specimens are not taken with care. As is well known, a small percentage of persons harbor the bacillus without having clinical manifestations of the disease. It is spread by direct contact with patients, and carriers. Children with hypertrophied tonsils and adenoid vegetations are more likely to be persistent carriers, so that removal of these structures may be indicated. The clearing up of such persistent carriers is very difficult. A number of different methods have been tried, but none with uniform success. Such carriers need not be isolated indefinitely, for the organisms are often avirulent. All children who have been exposed to infection and who have a positive Schick reaction should be given a prophylactic dose of diphtheria antitoxin. The immunity conferred is passive and cannot be depended upon for more than three weeks. In order to control the spread of the disease, all or nearly all infants must be actively immunized with the toxin-antitoxin mixture. Park and his co-workers have found that the results are just as certain when a smaller amount of less neutralized toxin is given and this has the great advantage that disagreeable reactions are avoided. All infants over six months of age should be immunized, the initial Schick test being omitted. They should be tested subsequently, and if a positive Schick reaction is present a second series of injections should be given. The present method is to give three injections each 1.25 c.c. of the toxin-antitoxin mixture, at intervals of two weeks. After the public has become familiar with the advantages of immunization against diphtheria, it will not be difficult to obtain the parents' consent. It will be advisable to require a certificate of immunization as is now required in the case of vaccination before entrance into school. Private physicians have the best opportunity to carry out this work of preventive treatment, for they have the infant under their care from birth and at the time when the baby is vaccinated, the importance of immunization against diphtheria can be emphasized.

**Grippe.** This term is loosely used for a number of catarrhal infections which occur in epidemic form, and have catarrhal symptoms, fever and malaise in common. In different patients and in different epidemics a number of different organisms have been found in the rhinopharyn-

geal secretions. Recently the "bacterium pneumosintes" has been isolated in a small series of cases by Oltsky Gates, and McCartney. A number of attempts have been made to produce the disease in human volunteers by inoculating the discharges from the rhinopharynx but without success. This is the more remarkable because susceptibility to grippe is almost universal. The disease is spread by direct contact, and mild cases and carriers are largely responsible. It is impossible to detect all of these, and even if it were possible they could not all be isolated. It has been suggested that all children with catarrhal symptoms should be excluded from school. This would be difficult to carry out in public schools, and if it was done, these children would have to be isolated at home. As such isolation is only effective if the children are kept in bed, the difficulties can be appreciated. It is possible that at the time the disease is epidemic the special causative organism or type might be isolated and a vaccine prepared for prophylactic inoculation, which would give at least a temporary immunity. If that was not possible, it might be worth while to attempt to stimulate the formation of antibodies by the injection of foreign protein.

**Chickenpox.** No definite infectious material has been isolated, but it is known to be present in the vesicles on the skin, and the disease can be produced in a mild form by inoculation with the contents of these vesicles. The disease is spread by contact, and also at a short distance, the infectious material being probably carried by air currents. It is most communicable in the early stage, but communicability is still present for a time after the eruption appears. Children may be immunized by inoculating them with the contents of the vesicles, and a passive immunity is conferred by injecting them with the serum of patients who have just recovered from the disease.

In order to really control the spread of these diseases it will be necessary to actively immunize all or nearly all infants against them, and to educate the public as to the value and necessity for such preventive inoculations. Vaccination against smallpox is an example of successful control and may serve as a model. In diphtheria we have a method of actively immunizing and it only remains to still further educate the public as to its importance. In measles I believe we also have a method of actively immunizing, it is only necessary to perfect the method and then bring it into general use. The whooping-cough problem should not be insoluble, for we know the organism which causes the disease, and it is not unlikely that a more potent vaccine will be prepared. Scarlet fever and grippe offer greater difficulties for in both diseases the character of

signs of poisoning have appeared it should be stopped until these have gone, and for forty-eight hours more, and then should be resumed with the maintenance dosage.

The excretion of the drug is variable with different patients, but usually lies between 2 and 3 grams of the leaf per day, so that 20 to 30 minims of tincture is the dose to give to maintain the therapeutic effect. It is best given as a single dose at night. There is no reason for dividing it up throughout the day, and the more frequent doses are an unnecessary source of annoyance to the patient.

When ordering the tincture, do not consider drops equal to minims. This is probably the commonest error made by physicians today in ordering digitalis, and leads to under-dosage and failure to obtain effects. Ten minims of the tincture of digitalis will take from 18 to 30 drops, depending upon the shape of the dropper, the position in which it is held, and the speed of dropping, so that 30 minims might be 54 or 90 drops in different cases. Either the patient should have a graduated measuring glass or pipette, or a mixture of the tincture in water, should be prescribed, so that there are 10 minims or 20 minims to the teaspoonful, and the teaspoon should be used for measuring the daily dose.

In considering what type of case demands digitalis treatment, it has become plain that it is not the mere presence of heart disease which makes digitalis necessary. There are many patients who have extensive heart disease and yet do not need this medication. No matter how severe the pathology may be, we feel that digitalis is only indicated by the presence of symptoms of cardiac insufficiency. There is no question, of course, about the advisability of giving digitalis to the severely sick-bed patient, whether the heart is regular or irregular, but it is not so generally realized that ambulatory patients, who complain of shortness of breath on ordinary exertions, are helped by the drug. A course of digitalis, lasting for from three to six weeks, will help most patients with these symptoms, even though the heart is regular and not especially rapid.

If the patient has the continuously irregular heart, due to auricular fibrillation, and if the heart rate tends to be 90 per minute, or more, when the patient is at rest, or goes to unusually high rates after exercise, then this patient should receive digitalis to show the heart rate, whether he has dyspnea or palpitation on exertion or not. The continual rapid beating tires the muscle and leads to a limitation of the ability to exercise. This limitation may entirely disappear when the rate is slowed to within normal limits. These patients then must continue to take digitalis as long as they have auricular fibrillation, in a daily dose sufficient to keep the heart at the proper

rate of beating, i. e., between 70 and 80 per minute.

The treatment of these patients with the irregular heart of auricular fibrillation has lately had a new phase revealed by the discovery of the action of quinidine. Quinidine is not a heart stimulant or a tonic drug, it is, in fact, a depressant to the cardiac muscle, but it has the peculiar ability of being able to abolish auricular fibrillation, so that the previous irregular heart beats again by the normal mechanism. The return to normal rhythm takes place in somewhat more than half of all patients who have auricular fibrillation, but some relapse again to the irregular action in a few days or hours, so that for practical purposes the treatment is effectual in about 40 per cent of the patients. If a patient remains with normal rhythm for a week or ten days, before relapsing to auricular fibrillation, it is usually possible, by a further course of quinidine, to return the normal rhythm in from 24 to 36 hours, and it may persist this time for seven to ten days, or more or less. Some patients retain the normal rhythm for weeks after quinidine treatment, and some for months or years.

The present state of our knowledge is so incomplete that we cannot say in advance whether a given patient will return to normal rhythm or not, or if he does, how long this will remain. On the average, a favorable reaction to quinidine is not as frequent in patients with advanced valvular disease, or patients with large hearts, as in those without valvular disease and without cardiac enlargement, but the individual patient often fails to follow the average behavior of the group. Many with much enlarged hearts or advanced valvular disease or both, can be returned to normal rhythm by quinidine, and some will retain this for a considerable time. I feel that at present, every patient who has auricular fibrillation should have a trial with quinidine, to see whether his heart cannot be returned to normal rhythm, for the patient is nearly always more comfortable with the heart beating regularly.

There are certain dangers connected with the use of quinidine, which should be clearly in the physician's mind, in order to avoid them, as far as possible. One danger lies in the fact that it is a depressant to the cardiac contractility, which results in a certain degree of weakening of the cardiac force in any patient to whom it is given. This effect only rarely causes an appreciable degree of cardiac failure during the administration of the drug, but it represents an influence which tends to be harmful rather than beneficial. In addition to this, quinidine tends to produce in certain patients, while under treatment, a very rapid ventricular rate. If this rapid rate is long persisted in, it will lead to a greater or lesser

degree of cardiac failure, from fatigue of the muscle. There are, thus, these two factors the toxic action on the muscle, and the production of a rapid rate, which tend to cause cardiac failure during the quinidine treatment. We must carefully watch the patients while under treatment, for signs of the onset of failure, or for an increase in the signs already present. If quinidine is seen to be doing harm in this way, it should be promptly stopped, for I have seen very serious failure result from continuing the drug after it had become evident that it was causing decompensation.

The tendency to cause decompensation should not amount to a serious danger, for it is easy to avoid if care is used. The one serious danger from quinidine is the possibility of sudden death. This occurs very infrequently, in less than 1 per cent of patients, but when it has once happened there is no redress. It is believed to be due to cerebral embolism, the clot coming from the interior of the left auricle. During fibrillation of the auricles they remain in the diastolic position, so that clots would tend to form because of stasis in the dilated auricular appendix. These clots are sometimes pushed out into the blood stream when the auricle begins to contract normally.

For this reason we should never attempt the quinidine treatment at any time less than four weeks after a period of severe decompensation. During this four weeks any clots that may have formed in the auricles will have become adherent so that they will not be so readily thrown into the circulation. Furthermore, the four weeks treatment with digitalis will improve the condition of the circulation and thereby the nutrition of the muscle of the auricles and by this will probably tend to favor the return to normal rhythm. I have, on several occasions found a second course of quinidine to be successful when it was given two or three weeks after an unsuccessful one and have often found the second course to result in a longer period of normal rhythm than the first. I attributed both these results to the improved condition of the auricular muscle, which resulted from the additional period of improved circulation.

Ventricular fibrillation may on rare occasions, be a cause of the sudden death during quinidine treatment. Ventricular tachycardia has been observed in patients under quinidine, and in dog experiments ventricular fibrillation itself has been noted. We do not know what predisposes to this, but it seems likely that the better the condition of the muscle the less the chances would be. This is an additional argument in favor of getting the heart in as good condition as possible before trying the quinidine.

The dangers from the use of quinidine must be contrasted with the dangers of continuing to

have auricular fibrillation. The danger is slight, if the patient is faithful in following out his digitalis treatment, so that his heart rate can be controlled by this. Occasionally sudden death occurs in these patients due to cerebral embolism, and occasionally they have emboli in the arteries of the extremities or the abdomen. Many of them have a more or less unpleasant sensation in the chest due to the irregular heart action and all of them must take digitalis daily throughout their life.

Patients who are not faithful in carrying out digitalis treatment and who have a too rapid heart most of the time, are in much greater danger of having emboli, and even without them the heart tends to a condition of chronic fatigue, which results in chronic myocardial changes. These patients tend more or less rapidly downward and for them the quinidine is especially indicated.

During the initial treatment with quinidine patients should be in bed and under close observation but a patient who has once been returned to normal rhythm by quinidine and relapses to fibrillation again need not be so closely watched, nor so closely confined during a second treatment. The first treatment should be preceded by a test dose of 6 grams of quinidine sulphate, to see if the patient has marked susceptibility as shown by buzzing in the ears, headache, nausea, or general weakness. If not then 6 grains every four hours should be given on the next day, giving 4 doses for the first two days and if normal rhythm has not resulted, giving 5 or 6 doses daily thereafter. The patient should be seen every day, and watch kept for signs of intoxication. It is hardly worth while to continue the treatment for more than six days in all, for those who return to normal rhythm after as much quinidine as this are not likely to continue with it long before reverting to fibrillation.

Sometimes the patient's reaction to the drug will demand its withdrawal. Palpitation which is very marked, headache, nausea, vomiting or diarrhea may appear, and indicate a harmful effect of the quinidine or, as has been already mentioned, signs of decompensation may appear to be increasing.

Whenever the patient returns to normal rhythm and usually they are able to realize this themselves the quinidine should be discontinued for that day. A dose of 6 grains should then be given every morning and night for several days following, as a prophylactic against the return of the fibrillation. The patient may now be allowed out of bed as soon as his state of compensation and general health warrant it.

A theoretical objection has been raised to giving quinidine while the patient is under the in-

fluence of digitalis Quinidine paralyzes the vagus endings, an action which helps to abolish the fibrillation, while digitalis stimulates the vagus, therefore tending to oppose the quinidine. The matter is of more theoretical than practical importance, for those who disregard it are able to report just as good results from quinidine as those who do not.

A patient whose return to normal rhythm is only for a brief time, does not receive much benefit, but when normal rhythm persists for from seven to ten days, or more, the patients usually feel much better. They have a consciousness that the heart is acting normally, they are released from the need to take digitalis continuously to keep down the ventricular rate and they have what little mechanical advantage accrues from the regular beating and from the presence of the auricular systole.

I wish to emphasize particularly that quinidine is an improper drug to use in the presence of a severely failing heart. It tends to increase the cardiac failure, and if normal rhythm is not quickly attained, may do irreparable harm. Moreover, the danger of embolism is greater at this time. First treat the cardiac failure with digitalis and then, if auricular fibrillation persists, treat this with quinidine.

Other forms of cardiac arrhythmia may be benefitted by quinidine. Paroxysms of rapid

heart action occur because of auricular fibrillation, or auricular flutter, or the rapid regular activity of some abnormal site of impulse formation, called paroxysmal tachycardia. The paroxysms may be of short or long duration, they may occur frequently or infrequently, but always their occurrence is a distressing event to the patient. Quinidine is often capable of stopping these paroxysms whatever their mechanism. It should be given in a 6 grain dose, immediately after the onset, and repeated at two hour intervals for two or three doses, if the attack persists. If one or more attacks occur daily, quinidine may greatly diminish their frequency, or even entirely stop their occurrence. For this purpose 6 grains before breakfast, repeated 6 hours later, has been found very successful, though one dose each morning may suffice, or 3 grains before each meal. I have seen no harmful results from continuing this dosage for many months.

The irregular heart action, due to premature beats, is not ordinarily a reason for treatment, as it does not lead to cardiac insufficiency or any other harm to the patient. Sometimes it is felt by the patient as a discomfort in the chest or even as a pain over the heart, and it then warrants treatment. Quinidine has been found of value for this purpose also, and should be given as described, for the prevention of paroxysmal attacks.

## SURGICAL TREATMENT OF GASTRIC AND DUODENAL ULCER\*

By GRANT C. MADILL, M.D.

OGDENSBURG, NEW YORK

UNTIL we are fully informed as to the cause of chronic peptic ulcer, there will be uncertainty and difference of opinion as to the treatment. On the one hand, patients will come to the surgeon for help when they should have been given a longer course of medical treatment, and on the other hand, physicians will continue to keep under their care those patients who should be in the hands of the surgeons. The laity is now familiar with the fact that operation can be performed for the relief of disturbances of digestion, that it is not unusual for the surgeon to be consulted concerning symptoms referable to the epigastric region before the patient has sought medical advice. The direct appeal by the patient to the surgeon, without careful investigation and judicious treatment by the physician, often tempts the surgeon to undertake immediate intervention in the hope of giving

prompt relief. His responsibility is thus greatly increased, and his unaided judgment passed upon a condition which, for the best welfare of the patient, requires consideration from the point of view of both the physician and the surgeon.

Possibly, this happens more frequently in small cities than in the large ones, for I have frequently heard surgeons connected with large hospitals state that they see practically no ulcers in the early stage, all having advanced to the stage requiring surgery before they see them at all. I believe that no chronic ulcer of the stomach or duodenum should be operated on before it has received careful and intelligent treatment by a physician, cases of acute perforation alone excepted. For acute perforation, both physician and surgeon agree upon immediate operation. Undoubtedly, patients with chronic ulcer do recover—at least temporarily—without treatment, but because

\* Read at the Annual Meeting of the Medical Society of the State of New York at New York City, May 22, 1923.

it can be shown roentgenologically that chronic ulcers do cicatrize, the evidence of ulcer disappearing, it does not necessarily mean that the ulcer is permanently healed. The important question for the surgeon to answer is "What can operative treatment accomplish in giving permanent relief from the symptoms, and what surgical principles should guide the operator in selecting the technic to be used in the individual case?" Reported percentages of recoveries and improvements, both under medical and surgical treatment, vary greatly, and it is difficult to obtain exact facts in any series of cases. The personal equation enters so largely into the conclusion based upon the final reports, that the percentages of recoveries, improvements and failures are only approximately reliable, no matter how carefully any certain group of cases may be studied.

The surgeons should not be satisfied unless the ulcer has been removed or the stomach put in such a condition that healing will result with restoration of approximately normal physiologic function. No patient has recovered until the ulcer is either removed or healed and the technic selected should either extirpate the ulcer by excision with knife or cautery or leave the stomach or duodenum in such a condition that permanent healing will take place. I do not however, advocate excision, because of the probability of the ulcer becoming carcinomatous for my experience, based on the clinical findings, the pathologist's report and the patient's after-history, does not lead me to agree with the teaching that chronic ulcers of the stomach become malignant, even those as large as 2 cm in diameter. I would not, therefore, offer a patient, as an argument in favor of surgical treatment, the possibility of the existing ulcer becoming malignant. In my own cases of gastric cancer, I am unable to find a single record in which the patient gives a clinical history that suggests the pre-existence of chronic ulcer. The symptoms of cancer come on suddenly, and when they first appear the disease has usually progressed to a stage that makes operative treatment hopeless as will be shown by X-ray examination or exploratory operations. If chronic ulcer be due to embolic infarcts the vitality of the tissues is reduced and repair is retarded, so that even when healing does occur, the scar tissue is easily destroyed by the action of the gastric secretions with consequent recurrence of the ulcer. Operative treatment that does not remove or destroy the diseased tissues is uncertain, and it is my opinion that failure to give the patient the relief expected after operation is usually due to the continuance of the ulcer, or its recurrence, even when cicatrization has originally taken place.

During the past twenty years, the operative technic of ulcer of stomach and duodenum has greatly improved. Gastro intestinal anastomosis has proved so satisfactory a means of giving relief in cases of cicatricial stenosis near the pylorus that patients were benefited by any method of anastomosis, provided only that the loop of ileum selected for attachment to the anterior wall of stomach was not too near the ileo-cecal valve. We have profited by the mistakes of our predecessors in the surgery of the stomach, and now have a fund of operative resources, enabling us to cope with any pathologic condition due to chronic ulcer. The method of choice should always be the one that offers, in the individual case, complete relief, prompt recovery, and the least risk to life. In spite of most thorough and careful study of a suspected case of chronic ulcer, by physical examination, chemical analysis of stomach contents, and X-ray, every operation upon the stomach is more or less "exploratory", and the technic to be employed is bound to depend upon what is revealed when the abdomen is opened and the organ exposed to the surgeon's eye and sense of touch.

There are many conditions so closely simulating chronic ulcer that the most expert roentgenologist or diagnostician may occasionally be deceived, so the surgeon should, therefore, always begin the operation in a humble frame of mind, only after the ulcer has been positively demonstrated can he feel certain of the diagnosis. When absolutely definite physical evidence is lacking we should not call upon our imagination to convince either ourselves or the visiting physicians that an ulcer exists. The fictitious finding of ulcer, and the performance of gastrojejunostomy in neurotic individuals, whose gastric symptoms were but a part of a general neurosis, has probably led to more failures and disasters in surgery of the stomach than any other cause. Blessed be the surgeon who, without a feeling of chagrin at not finding the preoperative diagnosis of ulcer confirmed on opening the abdomen, can after exploration of the viscera proceed to close the abdomen. I have much sympathy for the roentgenologist whose error in diagnosis is so frequently made an excuse by the surgeon when it is found on the operating-table that no ulcer exists. Roentgenology should neither be blamed for a mistaken diagnosis nor given all the credit for a correct one.

*Technic of Operation*—I find the upper right rectus incision the most satisfactory as it gives good exposure to the upper abdominal organs and can be so extended as to permit removal of the appendix if desirable, and exploration of the pelvic organs. When, however, an "hour-glass" contraction is shown by the X-ray located well

toward the cardiac extremity of stomach, the left rectus incision has distinct advantages. I am not in favor of the transverse incision through one or both rectus muscles, as it is difficult to explore the lower abdomen, or, if necessary, remove the appendix. Moreover, an incision in the abdominal wall for operating upon the stomach and intestine is liable to infection in spite of every precaution, and when this occurs in a transverse incision delayed healing with greater tendency to hernia will result.

After opening the abdomen by an adequate incision, a thorough exploration should be made, not only of the stomach and duodenum, but, so far as possible, of all the other abdominal viscera as well. If an ulcer is found as diagnosed, still further search should be made to determine if others exist. The ulcer on the duodenal or gastric side of the pylorus, which has produced marked stenosis, will be relieved by a simple no-loop gastrojejunostomy. Ulcer on the anterior wall of the first portion of the duodenum should be thoroughly destroyed by the cautery, the opening in the intestine closed, and a posterior gastrojejunostomy performed. Ulcer in the posterior wall of the duodenum is usually adherent to the pancreas, so that it cannot be dealt with by the cautery. Pylorectomy with removal of the first portion of the duodenum, is the most satisfactory method of treating this condition. Ulcers located in the wall of the stomach near the pylorus are best treated by a partial gastrectomy. There is a wide selection of a method for resection of the pylorus, with partial gastrectomy, and the choice of technic will be influenced by the surgeon's experience in the ease of its performance and the results he has achieved with it. It is, I believe, a good rule to adhere to the technic with which one is most familiar, and unless convinced that his method possesses distinct disadvantages one should not change because some other surgeon does the operation differently.

The method which I prefer is closure of the end of the duodenum and the divided end of the stomach with a posterior gastrojejunostomy, Billroth II. This has been so satisfactory that I employ no other, except in special conditions. Polya's original operation or Balfour's modification of it I employ occasionally, but can see no real advantage over the Billroth II except when a considerable portion of the stomach is removed for cancer or "hour-glass" contraction situated in the pyloric half. I have had no experience with the Billroth I, which, with certain modifications, has been recently advocated by Dr. W. J. Mayo. An ulcer located in the lesser curvature of the stomach is best dealt with by the technic devised by Balfour—the destruction of the ulcer by cautery, suture

of the opening, and a posterior gastrojejunostomy. If the ulcer is small the anastomosis is omitted. An ulcer on the anterior or posterior wall of the stomach I also prefer to treat by Balfour's technic, but unless it is so large that the defect left after destruction by the cautery cannot be closed without strain on the sutures and deformity of the stomach, I do not make an anastomosis with the intestines. The method employed in dealing with the "hour-glass" contraction of chronic ulcer should vary with location of the ulcer. Believing in destruction by cautery or excision, I am opposed to anastomosis, which overcomes the mechanical obstruction, but leaves the ulcer, unless, of course, it can be definitely determined that the ulcer has healed. Ulcers in the pyloric half of the stomach, or in the center, with great inequality of size of the two pouches, I prefer to treat by partial gastrectomy, with either the Billroth II or Balfour's modification of Polya's method. When "hour-glass" contraction is situated in or near the center of the stomach, with the caliber of the pouches about equal, I prefer to treat it by partial gastrectomy, with end-to-end approximation of the divided ends of the stomach, without anastomosis. The operation is sometimes difficult because of adhesions which make mobilization of the stomach hard to accomplish, but the results of this operation have been, in my experience, satisfactory. In suturing the stomach or intestine, it is important to have the parts so mobilized that there is no strain on the line of suture, to tie the sutures lightly and not to have them sufficiently numerous to produce strangulation of the tissues, thus interfering with repair.

Acute perforation of an ulcer of stomach or duodenum is a tragedy, and the outcome depends more on the promptness of the diagnosis than on the technic employed. The diagnosis ought to be made almost immediately from the history, symptoms and physical signs, and the patient given surgical treatment at once. In dealing with an acute perforation in the duodenum, the margin should be destroyed by cautery and the opening closed by sutures which include a graft of omentum in the second row. If operation is done within twenty-four hours of the occurrence of the perforation the general condition of the patient will be such as to make a posterior gastrojejunostomy reasonably safe. Later than twenty-four hours, an anastomosis may be done, but simple closure of the perforation will probably be all that is advisable. Whether gastro-enterostomy should be performed depends rather on the condition of the patient than on the length of time that has elapsed since the perforation occurred. Perforations of the stomach wall should be similarly treated, and a gastro-enterostomy

need not be done unless the ulcer is large with much surrounding induration and inflexibility, thus making closure difficult, with resulting deformity of the stomach.

The question of drainage is an important one and difficult to decide. The surgeon will be influenced by the time that has elapsed since perforation occurred and by the amount and distribution of fluid in the peritoneal cavity. Occasionally I feel secure in dispensing with all drainage, but if in doubt place a cigarette drain at the bottom of Morrison's pouch for twenty-four or forty-eight hours. If the peritoneal cavity contains a large quantity of fluid it is safer to introduce a drain extending down to the floor of the pelvis through a supra pubic stab wound. These patients should be kept under close observation, as serious complications frequently develop, requiring further operative treatment. The most frequent complications are infections of the incision in the abdominal wall, localized abscess within the peritoneal cavity, subphrenic abscess, abscess of lung, and empyema. As soon as abscess formation is recognized it should be promptly treated by drainage.

The after-care of patients operated upon for ulcer differs but little from the routine care following other abdominal operations. They are placed in bed in the Fowler position and given a solution of glucose and soda per rectum. Sufficient morphine should be administered to

keep the patient comfortable. Nothing is given per mouth for twenty-four hours. Should persistent vomiting occur the stomach tube is employed for siphonage and gentle irrigation. One troublesome feature of recovery from operation for ulcer is the partial suppression of respiration because of pain produced by the movements of the diaphragm; this, I believe, quite frequently induces pneumonia. It is a good plan to urge such patients to cough frequently, even though the effort should be painful, in order to clear the trachea of mucus. The diet should be increased gradually. Usually those recovering without complications are able to be out of bed at the end of two weeks.

**Summary**—The first stage of chronic ulcer of the stomach or duodenum represents a border line disease, which requires the attention of both internist and surgeon. While judicious medical treatment should always be tried at first, the patient should not be condemned to years of suffering and invalidism, in the hope of avoiding surgical intervention.

To those suffering from this type of ulcer, surgery now offers prompt and permanent relief with little risk to life.

Speedy and complete recovery of the patient should be the aim of both surgeon and physician, and no feeling of rivalry should ever arise between them, but rather whole-hearted and complete coöperation for the patient's best interest.

## ARTHRITIS IN ASTHMA AND OTHER FORMS OF ALLERGY\*

By WILLIAM LINTZ, M.D.,

BROOKLYN, N. Y.

**B**RONCHIAL asthma is still shrouded with a great deal of darkness, and any light that can be shed on the subject is certainly welcome. In examining a great many asthma patients I was struck by the fact that so many of them presented creaking crepitating joints. I wish to draw this fact to the attention of the medical profession because one does not expect arthritis in asthmatics. I wonder whether the vague pains, especially in the upper and lower extremities, which these asthmatics complain of, particularly upon change of weather and for which we have had heretofore no rational explanation, are due to involvement of the joints. The bones, muscles and nerves do not seem to be involved. Some asthmatics complain very bitterly of these pains in the upper and lower extremities and present

a confusing and obscure symptom but most of them, however, are not aware of the existence of the arthritis.

The arthritis affects the knee joints by far more frequently. Usually it is bilateral although one joint may be involved more than the other. The next joint affected is the shoulder joint. The small joints are but seldom involved. As a rule, the joints are perfectly normal in appearance, there is no redness, tenderness nor swelling. Occasionally, however, the knee joint may be definitely swollen, the normal depressions of the joint being rounded and filled out, and the whole joint presenting a full, glossy appearance. In the latter cases the joint is filled with a moderate amount of fluid, and the patella is floated upwards, and the patella click can be distinctly obtained. Motion of the joint is invariably not limited and is painless. The most characteristic objective finding about

\* Read at the Annual Meeting of the Medical Society of the State of New York at New York City, May 23, 1923.

this form of arthritis is the crepitation. If one places the palm of the hand over the front and sides of the knee joint and alternately flexes and extends the legs, a definite sense of crepitation can be felt, and sometimes even heard. Another characteristic feature of this arthritis is the fact that the patient is not aware of it, and, as a rule, complains of no pains. This arthritis is associated with no fever. As these cases were all office cases and did not have a periodic observation of the temperature, a slight temperature may have been present at times, but was unobserved by the patient. *An attack of asthma is apt to be associated with an aggravation of arthritis.*

I have no autopsy observations of the joints of these asthmatics. Comparatively but few autopsy examinations of asthmatics are recorded, and in these few, while the lungs, bronchi and the upper respiratory passage are thoroughly examined, the joints are neglected. For who would think of examining the joints of dead asthmatics? And yet I am convinced that there is definite pathology in most of the cases. In view of the fact that the X-ray examinations of these joints are negative, with the exception in some cases where it shows the presence of a moderate amount of fluid, the arthritis seems to involve the fibrous tissue resulting perhaps in a fibrositis and a certain amount of periartthritis. The bones do not appear to be involved. The pathology may be that of villous arthritis.

It is difficult to determine the cause of this arthritis. That asthma is an allergic phenomenon is universally admitted. That arthritis is very frequently associated with allergic and anaphylactic phenomena is very well known, for not infrequently after the administration of serum a very severe form of arthritis is seen. I believe that in nearly all of these cases the arthritis is part of the picture of allergy of asthma. I have seen the same arthritis in other forms of allergic diseases, migraine, urticaria and allergy of the gastro-intestinal tract. A group of such cases are reported by Bezançon<sup>1</sup>. His first patient had a long history of repeated attacks of acute articular rheumatism, and in 1918 developed symptoms of gastric ulcer which was treated by gastro-enterostomy. In 1919 he suffered again from acute articular rheumatism and diarrhea. Acute paroxysms occurred at short intervals, which were characterized by the appearance of pains, chills, fever and perspiration. It was discovered that these febrile seizures were caused by the ingestion of meat or eggs, the patient remaining free from symptoms when he was placed on a milk or milk and vegetable diet, and also that when he was given 0.02 gm. peptone one hour before meals he could eat eggs or meat with impunity.

It was noted that the food ingested passed abnormally rapidly through the alimentary canal and that meat was scarcely digested. This case of alimentary anaphylaxis is particularly interesting on account of the articular symptoms which make it analagous to serum sickness. The other patient had previously had several attacks of gout, the first of which appeared after intense digestive disorders. When he came under the author's observation he had a pleurisy, probably of cardiac origin. Whenever his chest was tapped and also when the pleuritic fluid was inoculated by hypodermic injection, typical symptoms of serum disease, with fever and arthralgia, were produced, which finally ended in an attack of gout located in the wrist. A parallel may be drawn between the symptoms produced in this patient also by the absorption of proteins and those which are observed in serum sickness.

*As most of our cases in our series of arthritis were aggravated by an asthmatic attack, this fact would tend to prove that it is of allergic origin.* I wonder whether, as in the bronchi, a pathological secretion is here also present, leading to changes in the joints, which are responsible for the crepitation.

Some cases may be infectious in origin. In view of the autopsy findings of Huber and Koessler<sup>2</sup>, and of Harkavy<sup>3</sup>, who have demonstrated practically in all their cases of bronchial asthma that the lungs and bronchi show definite changes which can only be interpreted as the result of chronic infection, it is logical to suppose that the arthritis in these cases is caused by a pulmonary focus of infection, for reasoning by analogy, we know the rôle played by focal infection in arthritis. On the other hand, the focus of infection may be in some other part of the body, as the teeth, sinuses, pelvis, etc., and causing both the asthma and the arthritis. It is improbable that the arthritis is the primary focus of infection which causes the asthma. *In practically all of our cases no focus of infection could be determined clinically.*

In some cases the arthritis seems to be of endocrine<sup>4</sup> origin, seems to bear a definite relation to the disturbance of ovarian, thyroid and pituitary function in particular. I have seen the same arthritis in cases of goitre, cystic ovaries, etc., without asthma. Some of these cases of arthritis may have a metabolic origin.

Seventy-seven cases of allergy had arthritis. Nearly all of the cases manifested definite crepitation in the joints, particularly the knee joints. Few of the cases presented no objective arthritis, but a definite unmistakable history. Evidently the arthritis had not progressed sufficiently to yield objective find-

ings. The complete diagnosis of each case may be seen from the chart. The blood and the other laboratory findings of these cases did not differ from the remaining cases of this series. There were 2 cases of migraine, 9 cases of skin and gastro-intestinal allergy, 10 cases of hay fever and 55 cases of asthma. As may be seen from the table, most of the cases presented at the same time a combination of the various forms of allergy. One case with pure endocrine manifestations with no other symptoms is included in the list to illustrate what I have said above. The total number of allergy cases examined is 200, practically all of them being asthmatics. This means that 38½ per cent of these consecutive cases in our series examined showed symptoms of arthritis. These 77 cases in no wise differed from the remaining 123 cases which were without a history or objective finding of arthritis. The blood findings were the usual ones of allergy.

#### Resume

1 The vague pains in the extremities of asthmatics is due to arthritis.

2 In most patients the arthritis is painless, and crepitation is the most conspicuous objective finding.

3 The arthritis affects the knee joints by far most frequently.

4 X-ray examination of joints are negative. Some show a moderate amount of fluid.

5 The arthritis is allergic in origin.

6 In a consecutive series of 200 office cases of asthma and other forms of allergy, 38½ per cent gave a definite history or objective findings of arthritis, arthritis is practically never mentioned in connection with these diseases enumerated in Table I.

7 Arthritis in the history or physical examination is a conspicuous finding in asthma and other forms of allergy.

### IMPORTANT EMOTIONAL TRENDS IN CHILDHOOD \*

By EDITH R. SPAULDING, M.D.

NEW YORK CITY

AS preventive medicine proves more and more what can be accomplished in the lessening of physical disease, so mental hygiene is showing at the same time what can be accomplished in the lessening of mental disease. There is probably no one section of this latter field not excepting the very definite luetic one, that is as pregnant with possibility as that of the development of personality during childhood.

From among the many unconstructive deviations which may be found among children's personalities a few trends stand out as important because of the close relation they appear to bear to the psychotic conditions of adolescence and of adult life. Of these trends the following six will be described in this paper.

I The tendency to indulge in unprofitable day dreaming which promotes unsatisfactory contact with reality as expressed in the accomplishment of every day tasks and actualities.

II The tendency to be resentful of authority

in any form with an associated desire to be supreme and to rule the world.

III The tendency to be overcome by feelings of inferiority based on real or imagined limitations or on false goals with no attempt to over-compensate for difficulties.

IV The tendency to indulge in tantrums and other forms of evasion as an alternative to facing the difficult and unpleasant situations of life.

V The tendency of shut-in ness the so-called introvert personality in which spontaneous physical and mental expression is inhibited.

VI The overdependence on home ties and childish affections which keeps the child at too self-centered levels and interferes with the socialization of his ego.

I The day dreaming in the adult and in the child is well represented by Miss C, a young woman of twenty five, and in Jane, a child of five years. The former patient who has been diagnosed as a borderline case of dementia præcox lived in a dream world much of the time from

her fifth to her twenty-fifth year. Some of her dreams were of such a deeply emotional nature that for hours she would lose contact with her surroundings.

She spent hours at a time in the bath tub, or lying on the floor, lost in a world that became so intense and so disconnected from the real world that she often had no memory for what she had been thinking after she emerged. There were several types of dreams, however, which she realized recurred constantly. One type had for its content the setting of a happy home and a mother and father who loved her. This was an attempt to compensate for maladjustments in the home of her childhood and to satisfy her inordinate craving for maternal and particularly for paternal affection. The second type of dream centered about the patient's ambition to be a genius in one of many ways, while the third type and the most dangerous represented extreme masochistic cravings. These last dreams had great emotional power, were very dramatic to the patient, and reached a climax of emotion while the patient imagined herself to be beaten. At the age of twenty-five after twenty years of comparative mental and physical incompetency this young woman is emerging from her dream world, is gradually becoming fit both physically and mentally and has given up entirely the extreme obstructions in which she has indulged for so many years.

Jane, a child of six, who had been diagnosed as a mental defective, was found to be entering on a similar career of evasions. It was suspected that her real difficulty was one of abstraction rather than of mental defect. This was borne out by the fact that in a three-month period of intensive treatment the mental age advanced one year and eight months, from four years and two months to five years and ten months, the Intelligence Quotient changing from 71.4 to 95.9. The attention and the concentration were greatly improved, the child became more naturally spontaneous and less erratic, and has been able for the first time to join in the play of other children. A visit from the parents, however, always tends to throw her back into her dream world and she will repeat aimlessly any questions asked her rather than make an effort to answer them.

The interesting point in these two cases is that at the ages of five and twenty-five respectively they represent similar types of evasion of reality through the mechanism of a dream world. The similarity of the two cases was so striking that the older saw in the younger her own childhood to such an extent that incidents and impressions of her earliest years came flooding back to her memory in a dramatic way, and became of help in the analysis of the factors on which her mental deviation was based. In *Peer Gynt*, Ibsen represents to us but too well the unconstructive results of such unproductive day dreaming.

II The second trend of importance, that of resentment of authority and a corresponding desire to rule the world, frequently results from either a too strict up-bringing or a too lenient one. A parent will sometimes say "this was our first child and we made up our minds that he should obey us at all costs. With the next child we were not so strict." An example of the results of the too strict training in early life is Miss F., a young woman of seventeen, who married on a dare and left her husband immediately after the ceremony. On further investigation the motive for this act was found to be an attempt to get even with the parents from whom the patient had never obtained the affection that she craved.

A precocious boy of ten whose more obvious problem was stuttering had attempted to thwart the too strict supervision of the parents by indulging surreptitiously and with amazing finesse in group immorality that knew no bounds. The resentment that develops of not being able to rule the world when parents are too indulgent and of not being able to rule anything when they have been too strict, is alarming. It is frequently found in paranoid states and reactions, and may be an explanation of much radical behavior. If the resentment can be unearthed in early childhood when it begins to develop, a useful adjustment to authority can be made and energy may be directed consciously into social channels rather than being allowed to drift unconsciously into asocial ones.

III The tendency to accept real or imagined limitations both physical or mental and to allow them to dominate ambition in actual accomplishment, instead of attempting to overcompensate for them in some way and make assets out of what appear to be liabilities, results in a state of inferiority which later may be found as a basis of mental depressions and of excitements, of schizophrenic states and of inadequacies in general.

A child of fourteen when away at school was asked by the other girls to be particularly kind to a classmate because they said it was the anniversary of the day when she accidentally killed her little brother. The child was thrilled and horrified by the tale told her and did everything in her power to help her friend. A few days later the girls told our patient that it was all a joke and laughed at her gullibility. During the entire year the child suffered keenly at their jibes at what they called her lack of sense of humor. She felt that she was inadequate in her estimation of human nature, and from being a dominating, self-confident personality she lost all faith in her own judgment. Her mental distress at the time was associated with a cessation of menses for a period of several months. It was the sense of inferiority resulting from this experience that formed the basis for indecisions later in life,

which together with an inability to adjust actually with idealism furnished a foundation for a manic-depressive psychosis.

A sense of fear or of shame is frequently a cause of feelings of inferiority. A boy of six who was told by his father that if he continued a certain type of behavior he would never be able to look any man in the eye, was haunted and depressed by the remark for years. The fact that he chose the ministry for a calling, instead of counteracting the effect only served to increase his sense of shame. A girl of eight was told by her mother that if she continued in her ways she would be either a bad woman or insane. In the psychoneurotic condition that developed in later life her mother's ill advised admonition was an important factor. A girl of five had an emotional experience which was so unpleasant that she was soon able to forget about it. A psychoneurotic condition that developed at sixteen and lasted until twenty one was almost wholly relieved when, soon after treatment was commenced, the incident was recalled to her mind through an association of a dream. While the incident was recalled intellectually at that time with marked relief of the symptoms it was not until a year later when the incident was recalled with all its emotional setting that the patient was wholly cured.

The middle child often grows up with a sad dearth of affection which may result in a feeling of not being wanted. A case in point is one that in addition to having this situation to meet, heard in her childhood that her parents had wanted a boy rather than a girl when she was born. The thought of this dominated her entire youth. She tried to compensate by always doing what she thought others would like her to, and formed of herself an artificial personality that quite took the place of her genuine self. When all these compensatory props failed to satisfy, she wove for herself in desperation a fantasy about an approaching marriage, and an elopement with a modern Prince Charming. She became so involved in her own imaginative ideas and the detailed plans for her elopement which she described to her school friends that she had difficulty herself in separating the real from the fictitious. It was a terrible task for this young woman of eighteen to face the world as it actually existed for her and to discover what her true self really was.

It is comparatively easy to help the child to face and overcompensate for such feelings of inadequacy. His sporting blood may be appealed to. But later in life when the individual is scarred with disappointments and defeat, the task is a difficult if not an impossible one.

IV The tendency to avoid difficult situations or to express anger at thwarted wishes through indulgence in tantrums is a common condition in childhood. Its true significance, however, and

the value of the tantrum as a means of interpreting the needs of the child are seldom appreciated. For the tantrum expresses not only a protest against authority in some form but it represents a projection of the child's inadequacy onto the other person. At the same time the child is reminded of past failures and associated emotional episodes, and experiences a corresponding chagrin. If the child can be helped to understand this and to face the reality of the situation an attitude can be developed which will be of inestimable value in both his personality development and his mental health of later life. Frequently the young woman of twenty or thirty tells of her struggles to attain such an attitude after adolescence. Often they feel that it is too late to begin and bitterly shift the responsibility onto their unwise training.

As we have pointed out elsewhere, equivalents of the tantrum expressed either negatively or positively, may be traced in many psychoneurotic symptoms in the psychoses, in antisocial behavior and in certain physical conditions. Other habits of evasion are frequent and have a similar effect on personality. It is not uncommon for a boy to admit that most of his time is occupied with trying to get out of work or of other disagreeable tasks. It was such an attitude as this that was in part responsible for some of the war psychoneuroses. The soldiers unconsciously became blind to avoid seeing, and paralyzed to avoid carrying on. In those companies in which this situation was recognized and in which the men were willing to carry on in spite of fear and inadequacy there were relatively few cases of so-called shell shock.

V One of the important reactions to inadequacy, defeat or thwarted desire is seclusiveness. From this characteristic develops the make up known as the shut in personality that is so often found in the early history of dementia præcox.

Before she was five years old Dorothy thought her father the most wonderful person in the world. She believed him when he said he went to his office each morning to press a button that would make the world go on. She wished to be supreme with him and when he betrayed her confidences, telling them to her mother, she suspected that her mother might come first in his affections. Gradually as she found she was not getting from him the affection she craved she sought for it in herself. For the next twelve years she indulged herself to an extreme degree in emotions which came at will following her mental content. Not until she was in a sanatorium during her nineteenth year did she become conscious of their nature or significance.

The conditions which result in shut-in ness can be reached in children, and much unhappiness

and resulting mental abnormality can be prevented

Another patient who was brought up in an idealistic atmosphere in which the physical universe was considered unclean and personal interest of any kind was discouraged developed such a starved and thwarted personality that spontaneous action was almost impossible in spite of her superior mind. On analysis it was found that her emotional development had remained fixed at the lowest level of childhood and that as soon as an emotion of any kind had tried to express itself it had been repressed, as unclean and unworthy. Such a foundation is favorable for the development of dementia præcox as well as of depressed states.

VI It is in the overdependence on home ties and on childish affections that the personality is prevented from reaching the power to which it is entitled and remains fixed at a level of immaturity. In several of the cases already cited there was a dependence on home conditions and on family affections that proved disastrous in many ways. The last patient described who had an extreme feeling of inferiority became acutely depressed whenever she was obliged to leave home. Another who had resorted to day-dreaming to compensate for the affection she craved, sank to a low level of inadequacy whenever she went home to visit, was erratic in the extreme, at times being highly excitable and controversial. At such times she became so dissociated and out of contact with her surroundings, that it required many hours for her to dress herself.

It is well known that many of the maladjustments and personality incompatibilities of married life are based on the too great emotional attachments of childhood and a corresponding dependence on nursery ideals.

A child who presents a behavior problem will frequently do well when removed from the home environment while a return to that setting for even a short period, will result in a return of all the asocial reflexes that have been conditioned there.

The trends that have been described are rarely as simple as might be imagined from the cases given. In each case there is a multiplicity of factors that are interwoven in such a way and are so closely interrelated in their causes and their effects that the entire picture appears as an intricate picture puzzle which instead of but two has three dimensions.

The three dimensions referred to might be described briefly as the intellectual, the emotional, and the physical, a combination of all of which constitutes the social and gives the reaction pattern of the individual. A factor in the physical, the importance of which is being more and more appreciated, is the endocrine status. Recent ex-

perience is substantiating the great value of this element in the trends that develop in the personality. It will be many years, however, before we shall be able to understand the intricate relationship between the endocrinogenetic and the psychogenetic elements.

In each picture pattern, however, there appears one motive that dominates all the others. It is this motive that constitutes the trend which the personality is developing.

### *Conclusions*

It is difficult for many people, and especially for mothers, to give up their illusion of altruism and disinterestedness in their children and to realize that every act is an attempt to gain an end which to them spells power. Still, even as old a friend as Ralph Waldo Emerson tells us that power is the aim of all existence, and we have only to consult some of the philosophers of the last few centuries to find the same mechanistic theories that are held by psychiatrists at the present time. Thomas Hobbes, of the 17th century, believed that the individual's behavior was based wholly on self interest, and that the conduct of each was but the expression of his fundamental instincts. John Locke somewhat later answered the controversy of free will versus determinism by saying that will is but a power or an ability which is determined by the desire for happiness. Freedom is another power or ability. To speak of free will, therefore, says Locke, is like speaking of swift sleep or square virtue. Hegel, in the 18th century, socialized this concept by showing the right of the other person to live his life also and to express his instinctive energy, too. He described the antagonisms which naturally exist between the individual and society and showed what advantage existed for both in the obligation which each felt for the other.

It is between the mill stones of the desires of the individual and the demands of society, of elemental desires and the standards of civilization, that the child's personality is constantly being ground.

If we grant the power of cause and effect in the universe, especially as it is evidenced in the development of personality, we should appreciate, too, the great opportunity that lies in directing the adjustments that are being made in the life of the child, so that they may result in social power rather than in antisocial or in psychotic conditions. To this end the child must be helped to go through, rather than around difficulties, by facing reality and avoiding unprofitable day dreaming. He must have adequate affection and encouragement in the family life, but not enough to cripple him by causing overdependence. His confidence must be won so that he will not repress

episodes and thoughts that cause him a sense of unnecessary shame and which may live in his unconscious to become the spectres of later life. He must be helped to make an adjustment with authority of whatever kind it may be, and to

assume his share of responsibility and obligation. And, above all, his life must be so full of healthy interests and activities that the less constructive ones will not have a chance to grow and will be crowded out.

## MODIFICATION OF BREAST MILK.\*

By WILLIAM HENRY DONNELLY, MD

BROOKLYN, N. Y.

**B**REAST milk may be modified as to quantity and quality in the mother's breast, and as to composition in the infant's stomach after nursing.

The quantity of breast milk may be increased

- (1) By nursing both breasts at each feeding
- (2) By increasing intake of liquids
- (3) By proper exercise, short of fatigue
- (4) By providing sufficient rest at night for the mother

The quantity of breast milk may be lessened

- (1) By limiting the fluid intake
- (2) By unwise purgation
- (3) By binding the breasts

The solids in breast milk are increased by shortening the intervals between nursings, and they are diminished by lengthening these intervals, especially by substituting or skipping a breast feeding.

The protein of breast milk is increased by nervous tension in the mother, or by overexertion and fatigue.

The fats in breast milk are increased by removal of mental worry from the mother, and by avoiding exertion or exercise.

The vitamins in breast milk depend absolutely on the vitamin content of the mother's diet. The main source of vitamins are fruit juices, eggs, fresh milk, preferably raw, leafy vegetables, the outer coats of the grains, and the glandular organs of animals. Deficiency of vitamins in the mother's diet may produce deficiency disease not only in her own body but also in her nursing infant.

O'Keefe of Boston and Shannon of St. Paul have shown that breast milk may transmit proteins to which the nursing baby is sensitized but which are apparently harmless to the mother. Skin tests have repeatedly shown this reaction to foods on the part of the child while the same tests were negative in the mother. Consequently digestive disturbances may sometimes be due to this cause in the nursing infant, and can therefore be corrected by eliminating the offending foods from the diet of the nursing mother.

Breast milk has about same caloric value as cow's milk, and the caloric system of feeding may be used in breast feeding exactly as it is used in artificial feeding. The caloric needs of the individual child may be estimated, and by weighing the child before and after nursing, it can be easily ascertained whether or not the caloric requirements are being met.

Laboratory tests of breast milk are unsatisfactory and I have come to use the phrase "The child is the best laboratory for testing his mother's milk." Such authorities as Fritz B. Talbot and Julius H. Hess agree in this statement for the following reasons:

(1) Because it is very difficult to secure every drop of breast milk for a sufficient period (24 hours, for example).

(2) Because the composition of breast milk may vary greatly in the same woman not only from day to day, but even from nursing to nursing.

(3) Because it is a common experience to have a child satisfied with, and thriving on, a breast milk which, from a laboratory standpoint, is all wrong. On the other hand, a laboratory report may show a classically correct chemical composition in the case of a breast milk which causes colic, flatulence, and digestive disturbance in the child.

If the child has colic and frequently green fermentative stools with excoriation of the buttocks, then that particular milk is too high in sugar for that individual baby. In this case, it often happens that the child is not emptying the breast but is taking principally the foremilk which is relatively high in sugar. This is common in cases where both breasts are fed at each nursing and it constitutes one of the objections to this practice. In such cases, if the milk supply be abundant, it is only necessary to express an ounce or so of the foremilk to correct the trouble. However, if the milk supply be scanty and the stools watery and green, then expression may or may not be done as is seen fit, and a complementary feeding given with high protein and low sugar content. For this purpose one may use Eiweiss milk, buttermilk, or the calcium caseinate powders of which the most commonly used are Larosan Casec, or Protolac.

In the use of protein powders it is wise to omit sugar from the formula, and to use saccharin if the child will not take an unsweetened formula.

If the stools show undigested fat, either macroscopically or microscopically, the child may be taken from the breast just before the complete emptying of that organ. This leaves the cream still in the breast, and it should be expressed manually by the mother after the nursing. Other evidences of fat indigestion are vomiting or sour eructations with the rancid odor of fat, and yellow glistening stools. In the case of fat indigestion a complementary feeding may be given which should be low in fat and high in protein, such as skim milk or calcium caseinate mixtures.

It is sad to note the number of babies which are taken from the breast every day merely because the milk of the mother was not 100 per cent suitable. No breast milk is wholly bad, but it may be corrected or modified either in the mother's breast or in the child's stomach so as to supply its deficiencies. It is a fact to be deplored that many physicians who observe keenly the stools of bottle-fed babies and are guided thereby in the management of their feeding, do not follow out the same cardinal principles in their management of breast-fed babies. Any one who has given careful study to infant feeding knows how to differentiate the various kinds or forms of indigestion by an inspection or examination of the stools, and is guided thereby in the prescribing of a formula. On the other hand, many capable artificial feeders of babies do not put into practice these same principles in the case of breast-fed babies. They either rely on a laboratory test of milk, or they take the baby completely off the breast because of factors which should be given a fair trial at correction by complementary feeding.

#### Conclusions

(1) No breast milk is wholly bad for any infant.

(2) Breast milk may be modified as to quantity, quality, and composition in the mother's breast.

(3) Breast milk may be modified as to composition in the infant's stomach by complementary feedings.

(4) Indications for the exact nature of complementary feedings may be made out from the infant's stools.

(5) Laboratory tests of breast milk are not a reliable guide in deciding the question of weaning a breast-fed infant.

#### DISCUSSION

DR DEWITT H. SHERMAN, Buffalo. The fore-milk contains about one per cent of fat, the middle milk two per cent and the strippings four per cent. This low percentage of fat renders fat fermentation in the baby infrequently. Fat

curds in the stools of a wholly breast-fed baby mean little, and never indicate fatty acid fermentation.

DR T. WOOD CLARKE, Utica. Feeding vitamin-rich foods to nursing mothers is too often neglected, owing to the belief that fruits and vegetables cause colic in the infant.

If the nursing mother eats what she does ordinarily, not only will she get plenty of vitamins, but she will not be likely to lose her milk.

DR FRANK HOWARD RICHARDSON, Brooklyn. Dr. Donnelly has in this paper done what we must all begin to do—consider breast-feeding as something to be conducted and directed and modified by the doctor, just as the doctor has previously done with his artificial feeding, whereas in the past it has been the custom to leave the details of breast-feeding to the mother and the grandmother.

The conscientious pediatricist can no longer neglect the fact that the maintenance and adaptation of mother's milk is his task, and that the earlier he has a chance to help in directing the whole process, and with it the health of the baby while he is well, the sooner will artificial feeding, with all its attendant ills, vanish from the face of the earth. The Minneapolis experiment, the Nassau County (Long Island) demonstration now going on, and the personal experiences of men who have made a definite effort to maintain, improve, and reinstitute breast-feeding as a definite routine in their practices—all have proved that the vast majority of babies can be kept on the breast—not wholly on the breast—for we have come to realize that the two most important features of the technique of breast-feeding are (1) manual expression of the milk left in the breast after the baby has finished nursing, and (2) the offering of a complementary feeding to make sure the child has had all that he needs.

Not all mothers need either of these procedures in order to carry lactation through the whole nine months of the lactation period *par excellence*, but the use of the complementary feeding, like the employment of a second speed for the laboring motor, even though it may not be absolutely necessary, makes it possible to make many a grade easily that would otherwise tax the engine seriously. A combination of breast and complementary feeding may be far better than exclusive breast feeding, for, while it gives the baby everything that an exclusively breast feeding would give him, it also ensures him an adequate supply at all times, accustoms him to the use of the nipple and bottle against the weaning time later on, and enables his mother to get about the rest of her multifarious household duties without fear that she may be defrauding him of some of his meal. Further, it enables the medical attendant to remedy any suspected insufficiency in the maternal supply, whether it be of quality or quantity.

*Neurology and Psychiatry*  
Chairman—IRVING H. PARDEE, M.D. New York  
Secretary—EUGENE N. BOUTREAU, M.D. Syracuse

## THE PRESENT STATUS OF THE PRACTICE OF MEDICINE ACT

Two weeks have elapsed since the Practice of Medicine Act was introduced in the Legislature and a week since the NEW YORK STATE JOURNAL OF MEDICINE carried the act to every member of the MEDICAL SOCIETY OF THE STATE OF NEW YORK. There has been abundant time for thoughtful consideration of the proposed act, and we can summarize the present status of the act.

1 Governor Smith has gone on record that a strong Medical Practice Act is needed, and that he will give his support to any measure which is approved by the medical profession. Since the proposed bill has the endorsement of the State Medical Society, the State Department of Health, and the State Department of Education, there is no doubt regarding Governor Smith's approval.

2 The Council of the Medical Society of the State of New York gives its approval of the proposed bill, and considers the bill to be for the best interests of the medical profession as well as of the public.

3 A large number of county medical societies have gone on record in favor of the act (see this JOURNAL, February 22, page 214). Those counties which are listed in the JOURNAL in opposition to the act, seem to be opposed to only one feature of the bill—that of re-registration.

4 Those physicians who are opposed to the proposed Practice of Medicine Act assign the following reasons for their attitude:

a. They object to the principle of taxation of physicians, although few object to the mere payment of the fee as such.

b. They fear that their licenses may be taken away on slight technical grounds. The law specifically provides that no physician can be penalized, except in a nominal way for mere failure or neglect to register and in no case can so severe a penalty as the revocation of a license to practice be imposed for the failure to register.

c. They fear that the law will not result in preventing the practice of cults.

5 It seems to be agreed that the proposed act will accomplish the following results:

a It will secure an accurate registration of all those who are entitled to practice medicine

b The five year period during which annual registration will be required is necessary in order to check up all practitioners. It gives the medical profession five years in which to clear house

c It provides an official bureau on which to place the responsibility for the prosecution of illegal practitioners

d It will permit a licensed physician to practice medicine anywhere in New York State

e It takes advantage of the present state of public opinion against quacks which may not be reached again in ten years

f The benefits of the medical profession far outweigh the petty annoyances that it may impose on physicians

g Destructive opposition to the proposed act will subject the medical profession to the accusation of blocking the sincere attempt of the State's Administrative officers to make a really effective Practice of Medicine Act

6 The chiropractors are holding meetings all over the State in an attempt to arouse public sympathy for the cult. Arguments used in these meetings are misleading and untruthful but they can be controlled by those who are willing to take the trouble to do so, as the following extracts from a letter show

"I want to report a matter of interest. We have a patient named ——— from ———. This place is a small town near Olean. He was an Assemblyman some years ago and knows more or less about how the strings are pulled. The other evening in Olean he heard there was to be a meeting at the Town Hall, and upon making inquiries, found that there had been about 300 people given invitations to come in, and they were having the Assemblyman and Senator from that district present. The idea was to show how the public felt toward the chiropractors and the bill that they have up.

After the chairman of the meeting had given a glowing report of what the chiropractors are doing and some of the audience had spoken in

favor of them, the ex-Assemblyman got up, and although the chairman told him that he had no business to speak, he insisted upon doing so, stating that it was a public meeting, and from what I gather, he certainly hit out straight from the shoulder. When once he gets started talking, he goes like an alarm clock. He called the chairman and all the rest of the chiropractors there in Olean a bunch of fakirs, and said that he had \$100 in his pocket that they could not prove to the contrary. He also told them that if they were holding any more meetings in the county he would make it his business to attend and let the public know the truth. He pointed out first one and then the other of the chiropractors, and called attention to the audience who they were, and what their preparatory education had been, and how they had only been away from four to six weeks and had returned to take the lives of the citizens in their hands. He tells me that they are going to hold a meeting in Wellsville, N. Y., next week, and I gave him the last number of the STATE JOURNAL that he might read those articles on chiropractic.

"That is the sort of thing that is more effective than a doctor, because everybody realizes that he has no axe to grind."

7 It will be necessary for the members of the County Legislative Committees to use their influence with their representatives in the Assembly, where the real contest for passage of the bill will take place.

In order that every physician may know who his Assemblyman is, a list of Assemblymen is printed on page 274 of this JOURNAL.

All letters and other communications regarding legislative matters that are sent to the STATE MEDICAL SOCIETY, 17 West 43rd Street, New York City, will be forwarded to the proper Assemblyman.

O S W

## THE NARCOTIC BILL

We have attended a meeting of the committee called by Commissioner of Health Nicoll, to confer with the Committee of the Bar Association regarding the re-wording of the Narcotic Act that was introduced into the Assembly on January 16th, by Mr. Weinfeld (see this JOURNAL, February 1, page 86). It was agreed that the medical profession should not be hampered by requiring physicians to fill out any slips and forms in addition to those already required by the Federal Harrison Act. It was felt that the Federal Act was ample so far as the physicians are concerned.

The committee was in sympathy with the views of Dr. Carleton Simon, that the problem of heroin control was one relating to the police and not to physicians, for Dr. Simon has shown that 97 per cent of heroin users are members of the underworld.

The attitude of the Bar Association is that of co-operation with the physicians and was taken in response to the representation of the leaders of the Medical Society of the State of New York and of the Department of Health of the State and New York City.

O S W

## BREADTH OF VIEW

The present discussion of the proposed Practice of Medicine Act reminds us of the debates in 1788 in the individual states over the adoption of the proposed Constitution of the United States of America. Earnest patriots, such as Patrick Henry, said that the Constitution would be the death blow to individual freedom and to local self government, while others, such as Alexander Hamilton, took the broad view of the national powers that finally prevailed. The Constitution is by no means perfect, the most eminent jurists differ in its interpretation, and it has been amended in eighteen details, and yet after a century and a quarter no one would consider its abolition.

The proposed Practice of Medicine Act may not be perfect in every respect, and no one can foresee its effect in every minute detail, but its broad principles are sound and the law as a whole is admitted by all to be the best that has ever been devised. If its execution is 75 per cent perfect, the physicians will probably be as well satisfied with it as they are with the Constitution of the United States.

The objections of the Practice of Medicine Act are based on three groups of arguments:

1. The failure of many phases of medical laws in the past
2. Present annoyance over re-registration
3. Fears of the inefficiency of future executions of the laws

Two outstanding past failures are urged against the proposed Practice of Medicine Act:

1. A somewhat similar law has failed to remove quacks and pretenders from among the dentists

2. The State Department of Education has not kept a record of those who have been licensed to practice medicine

The law relating to the Practice of Dentistry is similar to that of the Practice of Medicine. It provides for the education, State examination, licensing and county registration of dentists, but it fails to provide the machinery for the detection and prosecution of quacks and illegal practitioners. It selects and classifies the dentists and collects them into a bundle and puts a chain around the package, but the chain is too short and lacks the link of a responsible prosecuting body. The features of annual registration and notification of the State Board of Dental Examiners which are in the Practice of Dentistry Act accomplish nothing with the dentists because of the lack of responsible prosecutors, just as is the case with physicians. The chain is just one link too short. The present Practice of Medicine Law makes no provision for the collection and filing of a list of registered physicians. A criticism of the Department of Education as of all other Departments of the State Govern-

ment has been that it spends too much time collecting useless statistics. An up-to-date list of physicians would have been costly to obtain and would have been useless in the absence of a prosecuting bureau. But the fact remains that such a list is absolutely necessary in order to enforce the law. There is no use in deploring the lack of the list. The present problem is to go out and get it, and this brings us to the question of re-registration which simply means that the physicians shall do their share of the work of making the list.

The Practice of Medicine Law will be enacted and executed by office holders nearly all of whom are laymen. To them there is nothing incongruous or burdensome in requiring re-registration and the payment of a fee for the privilege of practicing a remunerative profession. Moreover, they accuse physicians of dodging their proper civic burden when objection is made to re-registration. Physicians will do well to remember who are making the laws, and to accept some annoying features along with those which are satisfactory.

The fears of the inefficiency of execution of the proposed Practice of Medicine Act in the future center around two arguments:

1. That the funds provided will be insufficient
2. That the method of raising the funds is wrong in principle and therefore the funds will not be effective

Those who fear that registration fees and prospective fines will be inadequate for the enforcement of the law may have good ground for their fears. The bill provides that the fees and fines collected under this act shall be used to pay inspectors and prosecuting officers in the Attorney General's office, and that the Attorney General may pay additional sums out of the appropriations for his office. A question arises as to the amount of money that will be at the disposal of the Regents and the Attorney General. If the legislators will provide a liberal sum of money, then the law can be enforced, but if the sum is too small, then the enforcement will be inefficient. Objection is made to re-registration and its fees on the ground that they are bribes to the State. A principle may possibly be raised that any registration fee is wrong. If it is wrong, it is an error of judgment and not of morals. The State is supreme and may impose any requirement that it sees fit. The principle of registration is old and well established in New York State, and physicians cannot expect to reform the fee system at the present time. We believe that the results which the proposed Practice of Medicine Law will accomplish will abundantly justify its makers and proposers, just as the operation of the Constitution justified the makers of the United States of America.

## ACTION WANTED

It is pleasing to note that the JOURNAL in its new make-up and with the broadened policy that has been adopted is apparently being perused at least, and mayhap being read more carefully since assistance in the form of correspondence is beginning to drift in to the Legislative Bureau relative to events happening in various places throughout the State. As has been pointed out before, the Bureau is anxious to have sent to it reports of medical meetings, welfare organizations and of cultist's propaganda, whether the same be in printed pamphlets, newspaper form, or authenticated word of mouth. For many times some little event may hook up in this Bureau with other material or reports and be of great value. For instance, this last week information has come to the Bureau that a meeting was held at Olean, N. Y., on or about February 15th, for the purpose of putting out cultist propaganda in the interest of the chiropractic cause. Your Bureau knew nothing of this from any of the physicians in that city, but the report was given by an interested person who lived in a neighboring city. That not alone are the physicians interested, but far-seeing laymen and legislators, who have listened to the arguments of

cultist propaganda, are interested in the public health to a degree beyond that which would be expected, is evidenced by the following information.

At this meeting, which was a public one, but apparently limited to those deluded individuals who had been exorcised to attend, there presented himself an ex-Assemblyman whose interest in the conservation of public health through rightful and lawful means was purely of an unselfish nature. He was informed, when the discussion was declared open to the body, that his presence was not desired and that he had no right to speak, but he proceeded to discuss the negative side of the question at issue, to the discomfort and dismay of the audience, and did so to such a degree as to impress some of those in the audience that the claims of the cultist were far and beyond the fact of the present day, and to say the least, were ephemeral in their logic. Would that other laymen and lay bodies might rise to the defense militantly of the medical fraternity whenever and wherever the opportunity is given, that the healing art may be kept within the sane bounds of absolute fact.

J N V V

## BIRTH REPORTS

Last week's issue of this journal, page 229, carried a note stating that prosecutions would be begun against physicians and others who persistently fail to report births. This action has been forced upon the State Department of Health after a long and patient campaign of education and persuasion.

The statutes of New York State charge every physician with the duty of reporting every birth within five days of its occurrence. This is a reasonable and necessary procedure and no physician finds fault with the requirement. The five days' time which a doctor has in which to make the report errs in being unreasonably long in favor of the doctor. The blanks with stubs are supplied by the State Department of Health, and are easy to carry and to fill out. The whole procedure is simple and easy, and requires only about ten minutes of a doctor's time, for which he is entitled to a fee of twenty-five cents.

It would naturally be supposed that the registration of births would approach one hundred per cent perfection, but such is not the case. Excluding the emergency births at which no physician or midwife was in attendance, and those in which two doctors were called and each supposed the other made a report, there are a considerable number in which the physicians themselves are negligent. There is a type of physician, fairly common, whose

aversion to putting pen to paper is as great as that of a truant school boy to writing a composition. The same physician will neglect reports time after time and will give no excuse for his delinquency. It will not do to say that the physician who is delinquent in his birth reports will be delinquent in other medical duties, for this is not usually true. The psychology of the matter seems to be simply an unconscious dislike to writing.

What is the remedy? It is not education, for the delinquents know the law and its penalties, and have received numerous warnings and appeals from the Vital Statistics Division of the State Department of Health and from the District State Health officers. It would seem that the only procedure is that of imposing a penalty for the violation of the Vital Statistics law. The maximum penalty is a fine of one hundred dollars or imprisonment for sixty days or both. The statutes provide that the commissioner of health, when he deems it necessary, shall report the violation to the district attorney, who shall forthwith initiate and promptly follow up the necessary court proceedings against the violator of the law.

If a physician finds himself under the ban of the law for failure to report his births he has no one to blame except himself.

F O

## HEALTH NEWS

The February 18th issue of *Health News*, the weekly publication of the State Department of Health, is an excellent example of what such a publication should be. The publication is a four page folder whose sheets are the size of the NEW YORK STATE JOURNAL OF MEDICINE. It contains official announcements and up-to-date news from the central office and from health officers' districts throughout the State. The present issue contains seventeen items eight of which are on scientific topics and have a direct application to the common experiences of physicians in private practice. Among these topics are the following:

1 The effect of freezing on toxin antitoxin mixtures

2 Typhoid carriers in New York State

3 Trichinosis in New York State

4 Chlorination of highly polluted water gives insufficient protection

5 Tularemia in New York State

Nine of the items are on administrative topics. Among those which are of direct interest to practicing physicians are the following:

Prosecutions for failures to report births

State clinics to be coordinated

Committee to investigate health conditions meets

Treatment of syphilis

MD or MV?

Three of the topics have been mentioned in the Daily Press Department of the NEW YORK STATE JOURNAL OF MEDICINE, and one is the subject of an editorial in this issue, but it was written before *Health News* appeared.

It is gratifying to physicians to know that the editors of *Health News* and of the NEW YORK STATE JOURNAL OF MEDICINE working entirely independently of each other, should discuss so many topics in common. This is an evidence of an increasingly close cooperation between the State Department of Health and the Medical Society of the State of New York. The editors of both Journals are finding that getting out their publications weekly requires an unexpected degree of speed and advance preparation.

*Health News* is sent to every physician practicing in the jurisdiction of the State Department of Health. Every doctor should read it regularly for it contains information which is sure to interest him.

F O

## PUBLICATIONS OF COUNTY MEDICAL SOCIETIES

The field of the activities of the official medical societies of the State and its several counties has broadened tremendously in recent years. Physicians are recognizing their civic relations to one another and to the public generally. The programs of medical societies now usually include discussions of civic relations as well as the presentation of scientific papers.

The State and the county societies represent organized medicine, and their leaders speak the opinions of the great mass of their members. It is manifestly impossible for all the members to attend conferences, study the details of laws, and make themselves familiar with the ramifications of medical civics. If one were to devise a means for informing the members regarding the policies and activities of the medical societies one would choose a periodical publication that should go to every member.

At least five county medical societies have recognized this need and have begun to issue their own publications to their members. These are as follows:

*The New York Medical Week*, published by the Medical Society of the County of New York.

*The News Letter* of the Suffolk County Medical Society.

*The Bulletin* of the Bronx County Medical Society.

*The News Bulletin* of the Medical Society of the County of Westchester.

*The News Bulletin* of the Medical Society of the County of Erie.

*The Bulletin* of the Medical Society of the County of Kings.

*The New York Medical Week* is now in its third year. It consists of from sixteen to twenty pages, about half of which carry advertisements. It gives the programs of the several medical societies of New York County, and contains special comments on current medical topics. It lacks the personal touch and appeal of the publications of the other counties, but it seems to be well suited to the varied medical constituency of the central county of the big metropolis with its cosmopolitan interests.

*The News Letter* of the Suffolk County Medical Society was described on page 574 of the December 1922 issue of the NEW YORK STATE JOURNAL OF MEDICINE. It is issued at irregular intervals as there is need for giving information to the members.

The Bronx County Medical Society issues a monthly *Bulletin* which reflects the enthusiasm

of the officers and members of the Society Its scope is confined almost entirely to the Bronx County Medical Society, and it fulfills the design of its editors to carry information and appeals to the members of the Society Its pages are enlivened with humor, and altogether it sets an admirable standard for other county medical societies to follow

The *News Bulletin* of the Medical Society of the County of Westchester is described on page 123 of the March, 1923, issue of this Journal

The Medical Society of the County of Erie began to issue a four-page *News Bulletin* on December 16, 1923 It is published under the direction of the Council of the Society, under the editorship of Dr G R Critchlow, Chairman of the Committee on Legislation It is filled with news of the activities of the County Society

The object of the *Bulletin* is clearly set forth in the first article, as follows "We believe that indifference and neglect (of civic duties) are due to the fact that the members at large are not kept in touch with the matters which constantly engage the attention of their officers and committees How could it be otherwise with meetings at two month intervals, and an attendance at these meetings of perhaps 15 to 30 per cent of the membership? What then is the remedy? Obviously closer contact between officers and members This little *Bulletin* is an effort in that direction"

Nearly a page of the *Bulletin* is given to legislative matters, and another page is a memorial to the late Dr John Pryor A striking feature is a half column description of the activities of the censors Five persons were successfully prosecuted for the illegal practice of medicine during 1923, three physicians were compelled to refund excessive fees to their patients, and three or four practising quacks were driven out of the city "The Board read the riot act to a number of druggist medicine demonstrators in department stores, etc, about counter prescribing, and believes the practice has been slightly curbed Many fakirs absconded after a visit from our investigators"

The *Bulletin* also contains news of hospitals and public health nurses and is well calculated to keep the Buffalo physicians informed about their civic duties

The newest publication of a county society is the *Bulletin of the Medical Society of*

*the County of Kings* It consists of four pages the size of the pages of this Journal It is written in a breezy, conversational way that pleases and attracts attention It starts off "GREETINGS! I make my bow to you This is a new departure The purpose of this monthly talk is to interest you and give to you the news of things medical—especially concerning your County Society"

The remainder of the first page consists of an appeal to attend the meeting of the Society on February nineteenth It says "*No scientific paper will be read* Inasmuch as we conduct twenty Friday afternoon lectures a year, the scientific part of our Society life is amply covered The eight monthly meetings will be devoted to civic and economic problems"

A half column is given to an appreciation of the work shop of Mr Paul Hoeber, who is publishing the year's Practical Lecture Series There are a dozen items of a civic nature, among which is a description of the conviction of a doctor who refused to pay his taxes on the ground that he wanted to be left entirely alone and permitted to mind his own business The *Bulletin* is full of humor, and is written in a style of friendliness that is characteristic of the Brooklyn physicians generally

The *Bulletin* makes several references to activities which are well known to all Brooklyn physicians, and whose fame is spreading to other communities The Friday afternoon lectures are a unique series given free at 5 o'clock in the auditorium of the Library of the Medical Society of the County of Kings Each one has been attended by an average of over 500 doctors, and the room has been filled to overflowing at every lecture

The Society is also conducting a plan for graduate medical education in co-operation with the Long Island College Hospital Medical School The instruction is given in the several hospitals at hours which are convenient to the physicians of Brooklyn and Long Island It is intended that the physicians shall have the opportunity to learn modern medical procedures while they are attending their private practice These two activities indicate the possibilities of united co-operation of the physicians of a community The new *Bulletin* is well adapted to arouse a desire for participation in the activities of the Medical Society of the County of Kings

BY GEORGE W. WHITESIDE

## EXCERPT FROM OUR BRIEF IN A MALPRACTICE CASE

Plaintiff seeks to recover on the basis of liability of the defendant arising from the relation of patient and physician and the defendant's breach of duty resulting from that relation.

The basis of liability, as in all tort actions is injury resulting from breach of duty. The duty of a physician relates particularly to his exercise of skill, learning and care, and his best judgment in the treatment of his patient. Mere failure to exercise these required elements of his duty is but the first step in establishing liability. The injury claimed to have been suffered must be one which is the result of that failure of duty on the part of the doctor. In this branch of any malpractice case there is a broad field of possible speculation that is not usually present in other tort actions. In ordinary cases of negligence the resulting injury is one which the average layman, from his general experience, recognizes as a consequence of the negligent act. Whether or not an injury arises in the treatment of a case by a physician, from his failure to use his skill, learning or care, is not so easy of determination because at the time the physician assumes the relation of physician to his patient, the patient is not in a normal state of health. The physician is summoned by reason of the fact that the patient is suffering from some physical disability. Whether the bad result or injury that is the basis of a plaintiff's claim in a case of malpractice is attributable to the physician's treatment or neglect or whether it is a condition that may reasonably arise under most skillful treatment is also a question that has to be determined in a malpractice case. It is in this field that the courts have attempted through their enunciation of principles to prevent physicians being mulcted by lay juries indulging in mere surmises or speculations with respect to technical and scientific facts. To determine whether or not the result in the case is a bad result and whether that bad result is attributable to some failure of the physician's duty to the patient in all cases requires evidence from medical experts.

This was stated by the Appellate Division of the First Department, as follows:

that the right of the plaintiff to recover must necessarily depend upon medical evidence, for the question is to what extent if any the failure of the defendants to properly treat the plaintiff aggravated the disease from which he was suffering or increased his pain or suffering. That question can be decided neither on the testimony of laymen nor by the jurors

on their own knowledge and experience without testimony" (*Lubbe v. Hulbert*, 135 App. Div. 227, 231.)

Even though it appear from expert testimony that such injury has resulted from the physician's treatment, unless the error of treatment be due to a failure to use skill or care there is no liability.

If such improper treatment is the result of an error of judgment in the selection of one of two or more procedures in a case, such error of judgment would not be the basis of liability, provided the procedure employed was an approved one and was skillfully used. Where there is more than one procedure in a given case which may be followed, there will necessarily be disciples of both methods in the medical profession. A small minority may steadfastly believe and employ one and a large majority the other. Both procedures may have definite advantages that may reasonably be claimed for them. It becomes a matter of judgment as to which procedure a physician should employ. If the profession is to be deprived of this freedom in the treatment of disease, no progress can be made. Departure of course, from approved methods may be at the peril of the physician employing such.

This may be the penalty that has to be paid for attempting innovation.

The question arising in this case at the outset is what is the proper and approved method of treatment of the disease of tuberculosis of an ankle in a child two years of age. If there were two schools of thought as to proper treatment in such a case, both of which have reasonable following in the medical profession could it be said that those following one would be answerable for bad results ensuing when disciples of the other school would condemn such procedure if called as expert witnesses? There may not be necessarily, but one proper and approved method of treatment, there may be many, and a physician in treating a case discharges his legal obligation if he employs with care and skill a proper and approved method. In the case at bar let us assume for the purpose of illustration that there are two procedures that are employed by reasonably skillful physicians in the treatment of the plaintiff's condition.

1. The immobilization of the local part affected and a general building up of the system by fresh air, sunshine, diet, tonics, etc.

2 Early operation upon the particular bone or joint affected

If a physician employs the first and there develops thereafter evidences of the disease in other parts of the body and the disciples of the second method of procedure were of the opinion that the appearance of the disease locally in other parts of the body was occasioned by the failure of early operative interference, would that create a liability upon the physician who had employed the first method? If the non-operative method were a recognized approved method it could not be contended that there is liability, because to do so would require that we hold that a bad result is evidence of malpractice, which would do violence to the established law of malpractice. Similarly, if the second school, believing in early operative interference, were to employ its method of treatment and a similar bad result appeared, that fact would not be evidence of any liability on that physician.

In the case at bar we have not as strong a justification for the operative procedure as the one just supposed. Operative procedure in this case is supported only by the expert testimony of one physician, which when analyzed constitutes simply a statement of what he would have done under the circumstances, what he would regard as proper, what he believes was the result flowing from the use of the immobilization procedure. Assuming that he possessed the necessary qualification, his opinion at best is simply of one school of thought. The predominant opinion is to the contrary, as is shown by the testimony of the eminent surgeons who testified for the defense, and by the quotations from eminent authorities in the cross examination. The mere expression by expert witnesses of different views and opinions does not necessarily create an issue for the jury. It is not for the jury simply to choose one opinion or another on a thoroughly scientific subject and to believe one and disbelieve the other, where both may have substantial scientific support. The best that could be said would be that the question of method was doubtful, and if that be so, the jury would

not be permitted to guess or surmise as to which method should have been employed and whether different results would have flowed from employment of a different method where both methods have support in scientific circles.

A physician is not liable in negligence for his treatment because other physicians might have adopted other methods, if the method adopted has substantial medical support, and where there is a difference of opinion a physician may exercise his own judgment. *Schumacher v Murray Hospital, et al* (Supreme Court, Montana), 193 Pac Rep, 397. *Yaggle v Allen*, 24 App Div, 594.

The plaintiff, however, in this case had but one physician who advocates early operative interference and who has not in any way indicated that his opinion has the weight of authority among his professional brethren. His opinion is based on the assumption of the presence of an abscess in the ankle, and that opinion rests solely upon what the father and other members of the family of the plaintiff stated were the symptoms they observed. His willingness to make such a diagnosis upon the observation of lay persons of admittedly subnormal intelligence was expressed by him when he testified that he would order an operation over the telephone were such symptoms told him by a layman, without seeing the patient. It is difficult to believe that he represents any recognized school of thought in medicine. There is no proof in the case that he does. There is no evidence in the case that any other physician agrees with him. If this type of evidence is sufficient to discharge the plaintiff's burden, then all that is necessary to place in the hands of a lay jury the opportunity for wild speculation on scientific facts, the condemnation of an established medical procedure, the ruination of a professional man's reputation, is to have some one holding a degree of Doctor of Medicine, utterly unknown, unvouched for, a professional rolling stone, take the stand and express his personal condemnation of the treatment. This does not discharge the plaintiff's burden in this class of case.

G W W

#### OBSTETRICIAN ENGAGED FOR DELIVERY—SUED FOR NON-ATTENDANCE

The defendant was engaged to attend the plaintiff in her confinement and for the aftercare, also to give the plaintiff the necessary medical attention before delivery.

At about the time of the plaintiff's expected delivery the defendant examined her and found that she would not give birth at that time and stated that he should be called when the plaintiff felt ill. Two days later the defendant was notified that the plaintiff was about to give birth and, it is claimed, that the defendant though repeatedly notified failed to call upon the plaintiff and

attend her during her delivery, that he sent another physician to attend the plaintiff, that this physician administered medication to the plaintiff for the purpose of delaying her delivery until the arrival of the defendant, that early in the morning of the succeeding day the plaintiff was in active labor and was delivered of a child by the physician whom the defendant had sent in his place and that the defendant though notified did not attend the plaintiff at the time of her delivery. The plaintiff's child died on the day following its birth and the plaintiff claimed that

by reason of the failure of the defendant to attend her at the time of her confinement she sustained various injuries to her internal organs and suffered great pain and sought to hold the defendant responsible.

The defendant had seen the plaintiff from time to time during the prenatal period and given her the necessary and proper attention and treatment. At about the time of the expected delivery of the plaintiff the defendant upon examination found that the membranes had ruptured and that she had a temperature. At that time he advised the plaintiff to go to a hospital. She deferred following his advice until the return of her husband, who though advised by the defendant to send his wife to a hospital refused to consent.

On the afternoon of the second day the plaintiff was again examined by the defendant and her condition disclosed that birth was not imminent at that time. Out of precaution the defendant notified his associate to call upon the patient that evening and to keep watch of her and if labor progressed to notify him. The defendant's assistant attended the plaintiff that evening and found upon examination it might be necessary to induce labor as the pains were weak and tardy and she was also running a marked temperature. Later that evening the defendant's assistant notified him by telephone of the plaintiff's condition. The defendant again advised that the patient be removed to a hospital, which the patient's husband refused to consent to. Medication was administered by the defendant's assistant pursuant to his instructions to shorten the first stage of labor. The assistant remained in attendance upon the patient, making the necessary examinations to observe her condition. After several hours there was little progress in the labor and the assistant left the patient's home with instructions to notify him when labor had further progressed. Within about half an hour he was notified and returned to the patient's home, at which time he found that the head was engaged and that there had been rather rapid developments towards delivery. The defendant was immediately notified by telephone, which was about four

o'clock in the morning. The assistant then proceeded to care for the plaintiff and delivered her. There was normal delivery of the placenta and no tear of the perineum.

After the defendant's assistant had fully cared for the patient and child he cleaned up and prepared to leave when he was told by the plaintiff's husband that he had gotten rid of the defendant and that the defendant's assistant should take care of the mother and baby. The assistant returned later on the same day and also in the evening giving necessary care and attention to the mother and child. Other physicians were called in consultation as to the child but its condition was such that it died on the following day.

The defendant when he had received notice that labor was progressing which was about three or four o'clock in the morning, prepared to go to the plaintiff's home, but as he was leaving he received a telephone call from the plaintiff's husband who told him that his services were no longer required as his assistant was attending to the patient. Upon this notification the defendant did not go to the plaintiff.

The theory of the plaintiff's complaint was that having engaged the defendant to attend her in her confinement he had breached his obligation and attempted to lay at his door responsibility for the injuries which she claimed to have suffered which were the natural and inevitable results of her physical condition and delivery. There was no complaint made by the plaintiff as to the services rendered by the defendant's assistant, it being admitted that he had properly attended and cared for her at the time of delivery and in the aftercare of herself and child.

Upon the trial of this action, after the plaintiff had introduced her testimony and rested the court dismissed the complaint, characterizing it as entirely baseless and unfounded. The attorney representing the plaintiff in this matter had several other malpractice actions but having met with the result of a dismissal of this case he decided to abandon his other actions, concluding that malpractice litigation was unproductive.

# LEGISLATION

By James N Vander Veer, M.D

## LEGISLATIVE BILLS

### SENATE

In Re the State Institute for the Study of Malignant Disease at Buffalo, N Y—Senate Int No 175 (Print No S 175), by Senator Michael E Reiburn of New York, concurrent Assembly Int No 195 (Print No A 195), by Assemblyman Julius Berg of Bronx County, would amend Section 345, Public Health Law, by placing fiscal control of State Institute for Study of Malignant Disease with State Department of Health

See comment on page 82 of the February 1st JOURNAL and page 132 of the February 8th JOURNAL

We have received from the Chairman of the Committee on Legislation of the Erie County Medical Society the following letter, which is published for the information of the members of the Society

### COPY

MEDICAL SOCIETY OF THE COUNTY OF ERIE

February 12, 1924

Dr James N Vander Veer,  
Pine & Chapel Sts,  
Albany, N Y

DEAR DR. VANDER VEER

I have before me Senate bill No 175, introduced by Mr Reiburn and referred to the Committee on Public Health This bill proposes to amend Public Health Law in relation to the fiscal management of the State Institute for the Study of Malignant Diseases

The Erie County profession is strongly opposed to this bill, as it proposes to take the management of the Institution out of the hands of the present Board of Trustees and make it a department of the State Board of Health We look upon this as only a first step to further measures looking toward absolute control of this Institution and possible removal of same from Buffalo

I am writing Mr Carroll, of the Committee on Public Health, along this same line As this measure is of interest particularly to the Erie County membership of the Society I feel that the Committee should be guided by our feelings in the matter

Very truly yours,

(Signed) G R CRITCHLOW

Another letter has been received which brings up certain considerations of a personal nature and commends the present Board of Trustees of the Institute, but which also points out that the Institute was under the State Department of Health from 1902 to 1911, and in the latter year legislation was sought and obtained putting the Institute on an independent basis under the present Board of Trustees, who are appointed by the Governor, and may be removed at his pleasure These trustees serve without compensation and have charge of the finances and management of the Institute

In view of the fact that the Chairman of the Committee on Legislation of Erie County Medical Society has asked me to bring this matter once more to the attention of the members of the Society, the bill will be kept in the active columns of the JOURNAL and information given to the Society as to its progress or disposition

The Narcotic Bill—Senate Int No 285 (Print No S 289), by Senator Morton J Kennedy of New York, concurrent Assembly Int No 342 (Print No A 342), by Assemblyman Morris Weinfeld of New York, still rests in Public Health Committee in each House

It is to be hoped that a conference will be held concerning the elimination of certain features which are considered objectionable by the medical profession In this connection your Chairman has received a letter from Mr Stephen P Anderson, who is the Chairman of the Committee on Legislation of the New York State Bar Association, together with a report of that Committee in relation to Narcotic Drug Control presented at the 47th Annual Meeting of the New York State Bar Association, held on the 18th and 19th of January, 1924 The report of the Committee is printed here in full

Report of the Committee on Legislation of the Bar Association in relation to Narcotic Drug Control Presented at the Forty-seventh annual meeting of the New York State Bar Association Held at the City of New York, on the 18th and 19th of January, 1924

To the New York State Bar Association

Your Committee was appointed at your annual meeting in January, 1922 For over two and

one-half years, since the repeal of the Narcotic Drug Control Law at the legislative session of 1921, our State government has wholly lacked indispensable control over the drug evil. Apparently, its repeal was induced primarily by onerous regulations adopted by the Commissioner, and its concurrent re-enactment, but eliminating the Commission, failed accidentally. We understand that the bill for that purpose, having been passed practically unanimously, was not approved by Governor Miller because no appropriation had been made for enforcement by the State Department of Health.

The policy of State control over the drug evil has been imbedded in our statute law since the evil first manifested its intolerable menace more than two decades ago. The alarming increase in addiction and illegitimate traffic led to the exhaustive Whitney Committee investigation, promptly followed by the formulation of the elaborate Narcotic Drug Control Law enacted in 1918. It was then regarded by many as a model. Undoubtedly, defects and deficiencies developed in enforcement. But a State control law is indispensable to effectively cope with the evil, and it is hardly conceivable that the Legislature would have repealed that law, except upon the assumption that the substitute enactment would be approved by the Governor.

The repeal of the law aroused an immediate public demand for effective legislation, in which the Committee of the State Association of Magistrates, Committees of all the more important Medical Associations and of this Association urgently joined.

The activities of your Committee in forwarding legislation in the session of 1922 and the Committee's recommendations are shown in detail in its special report dated February 28, 1922, and its annual report dated December 29, 1922.

At the Medical Conference called by Governor Smith and held at Albany in February 1923 attended by the leading medical men of the State the urgent need of legislation on this subject was unanimously proclaimed giving to this vital public movement the professional impetus and direction essential to a rational and progressive solution of its inherent problems. Through the active participation of your Committee with Committees of representative medical and other organizations, and with public officials, a simple and comprehensive bill was formulated in accord with the Federal Harrison Act and along the lines generally of a draft for a Uniform State Narcotic Drug Control Law, formulated under the auspices of the American Medical Association Committee on Narcotic Drugs.

The enactment of this bill was recommended in a special message by Governor Smith to the Legislature dated April 11 1923.

The Governor's recommendation gives a concise statement of salient features of the proposed legislation, demonstrating clearly that there can be no real ground for legitimate professional or trade opposition, as follows:

"At the same medical conference the subject (narcotic drug control) was discussed, and based particularly on recommendations by the committee appointed at that conference and by other groups called in to advise me I am transmitting to you legislation which I think will meet the situation as it exists at the present time, and enable us to go forward gradually to the acquisition of a body of information concerning the subject as it affects this State. We will then be able to apply more constructive remedies as the situation clarifies.

"Naturally our efforts should be toward prevention of the spread of drug addiction, and the legislation which I am submitting to you is aimed at this. It provides for the enactment into State law of the provisions of the Federal law, known as the Harrison Drug Act, and permits acceptance of the Federal order slips and blanks as of record in the State, requiring a third blank to be filed so that we will be able to build up our own body of statistics. From these statistics it will be possible, in a year or two, to know what further steps, if any, are necessary for the control of the addict who is not a criminal.

"Police authorities will be assisted in their prosecution of drug peddlers by placing at their disposal an analyst whose function it will be to analyze drugs confiscated and to testify in court concerning them. The Insanity Law is to be amended so as to place under the supervision of the State Hospital Commission, private institutions for drug addicts. The State Hospital Commission is also given the right to license and inspect such institutions. This is a logical expansion of their functions.

"Reputable private physicians are not restricted by the provisions of this Act. It contains provision for the commitment by a magistrate of persons applying voluntarily to a magistrate or judge for such commitment for treatment.

"In the main the police authorities will administer the act. The triplicates of the order blanks on which the drugs are bought and sold are to be filed with the State Police for the purpose of having a centralized record. By enacting the provisions of the federal drug control law into the statutes of the State and building up a volume of statistics, we will not be creating any new administrative department and we will strengthen our control of the criminal and come closer to a solution of the preventive phases of this problem.

"I hope that you will proceed to early enact

ment of this much needed legislation so that we can have a constructive program under way which will finally lead to a rational solution and control of this dangerous and evil traffic

\* \* \* \* \*

"Certainly there can be no difference of opinion either as to the need to go forward with a program for control of the spread of the narcotic drug evil"

The bill (See Assembly Print Nos 2223, 2400, Int No 1835) was not reported out of committee by either House. We cannot conceive of any explanation for failure to enact this legislation, other than the lateness of the session when introduced and tremendous pressure incident to unprecedented volume of important matters

Partisanship impeding an indispensable measure to arrest the ravages of this sinister monster, the narcotic drug evil, is inconceivable. The Federal foundation for the form of the measure, and its disinterested conception through high and representative professional efforts, preclude any possible suspicion of partisanship in its inception

The bill is about to be re-introduced. Its passage will be a demonstration of public-spirited, non-partisan devotion to the sovereign welfare of the whole State, such as has invariably actuated all legislation on this subject

Intricate ramifications in the highly profitable illegitimate traffic in these dangerous drugs lead us to give warning of insidious, obstructive propaganda, so disguised as to delude the ignorant or thoughtless. We instance an assertion broadcast last session that it should be the policy of our State to leave narcotic drug control to Federal law and enforcement, since liquor prohibition under the Volstead Act was treated that way by repeal of the Mullen-Gage Law. Whatever public opinion may be in this State regarding the prohibition of light wines and beers, there is and can be but one, unaltered public opinion regarding the non-medicinal use of narcotic drugs—that it is a monstrous evil which must be fought to extermination by organized society over the whole world, and against which every nation, State and community must wage relentless and concerted warfare, as almost all are earnestly striving to do

Indeed, it must be a dominating aim throughout our country to have formulated through the indispensable processes of the National Conference of Commissioners on Uniform State Laws, a Uniform State Narcotic Drug Control Law, and to secure its adoption by the legislatures of every State in the Union. The proposed legislation in this State was formulated so as to accord strictly with this ideal, after taking into consideration the laws of the principal States affected by the evil, as well as the Federal Law

We recommend that the Committee be continued, also the adoption of a resolution at the Association's annual meeting recommending the enactment of the proposed legislation, and the formulation of a Uniform State Narcotic Drug Control Law under the auspices of the National Conference of Commissioners

In conclusion, we deplore the death during the year of Hon Charles Thaddeus Terry, whose zealous and invaluable services as a member of this Committee are indelibly impressed in its work. Professor Terry was probably the most distinguished national authority on uniform State laws, having served seventeen years as one of the Commissioners of this State, and several years as President of the National Conference, and we feel bound to publicly record his opinion

"There is no subject on which there is more need of uniform laws than that of narcotic drug control"

New York, January 8th, 1924

Respectfully submitted,

STEPHEN P ANDERTON,  
*Chairman*

GEO GORDON BATTLE  
J HARRIS LOUCKS,  
PETER B OLNEY,  
CORNELIUS F COLLINS

The letter accompanying the above report calls attention to the fact that the Committee believes "the bill is in accord with the recommendations in the report (See NEW YORK STATE JOURNAL OF MEDICINE, May 1923, page 222) of the Medical Advisory Committee appointed by the Governor after the Governor's Medical Conference last year, of which you are a member, with one qualification, which I shall presently mention"

The letter then goes on to state the embodiment of the Harrison Act in the State law that there are no provisions for a State regulation of reduplicating of blanks affecting the physician, that under Section 426 the sole test of professional responsibility is good faith in the course of practice, Section 427, regarding the written prescription, is the same as in the Harrison Act, Section 428, regarding the record of drugs administered or dispensed, is the same as in the Harrison Act, BUT requires an annual return on blanks, showing the amount of drugs on hand and, etc., for that period

The letter calls attention to the fact that ambulatory treatment of drug addicts should be prohibited by law, and substitutes a policy of segregation and confinement

Attention is also called in the letter to Section 435, providing for reports of treatment so that

official statistics may be compiled, thus "affording a foundation for constructive adoption of the policy of segregation and confinement recommended."

"Need for immediate State legislation for control of the evil is such that no other course seems practicable this session."

Again a digest of the bill from the viewpoint of the Law Committee is printed here.

The attention of the members of the Society is again called to the full text of the bill as printed on page 86 of the February 1st JOURNAL.

Assembly Introductory Bill No. 342 introduced by Mr. Weinfeld, follows as closely as practicable the provisions of the Federal Harrison Law. No State authority or court has any power to enforce that law. The primary purpose of the bill is to confer the same power upon the police authorities and courts throughout the State. It further provides for building up statistics enabling future constructive solution of the entire problem, and provides for a means of caring for addicts committed for treatment either involuntarily, when arrested for any reason or voluntarily, in the desire to escape the drug.

#### *Peddling and Illegal Possession a Crime*

The bill makes possession, or dealing in the narcotic drugs specified, except in accord with the law a misdemeanor, and then proceeds to describe how persons can legitimately come into possession of and deal in them as under the Harrison Law. Except physicians, dentists, veterinarians, manufacturers or dealers, an individual can legitimately acquire the specified narcotics only through a professional man for a medical need.

#### *Federal Order Blanks Used*

It adopts the system of the Harrison Act for purchase on order blanks adopting the Federal order blanks and adding only the requirement that the person giving the order must make an other carbon copy of the original and file it with the State authority. This copy is to be made on a blank furnished by the State.

#### *Physicians*

No record of prescription is required. Prescriptions must be kept on file by the pharmacist filling them for the two-year period he is required to keep them under the Harrison Act. No special prescription blank or duplicate prescriptions is required, but the physician or veterinarian writing the prescription must date and sign it, and

give his Federal number, as required under the Harrison Act. If a physician dispenses or administers narcotics, he must keep the same record as required under that act, and send a report to the State authority annually, showing the gross amount used in the past year. He may prescribe, dispense or administer narcotics in good faith in the course of his professional practice only thus adopting the language of the Harrison Act. Dentists may not prescribe. Veterinarians may prescribe or dispense for, or administer the drug to, animals and not for any human being.

Physicians undertaking treatment of the habit are required to file reports with the authorities in each case except that cases treated in a hospital or sanitarium are to be reported annually. In this way statistics will be accumulated showing the extent and localization of addiction, affording means for future constructive solution of the problem. Private hospitals and sanatoria must be licensed by the State Hospital Commission which already has a similar function for private insane asylums.

#### *Commitment of Addicts*

The need of the addict prisoner for treatment is met by permitting the court to commit him to an institution for treatment. Voluntary commitment of other addicts is also provided for.

#### *Statistics*

Statistics of the amount of narcotic drugs dealt in are collected in the office of the State police where the copies of Harrison Act order forms are sent, and to make these statistics complete dealers file returns of the amount of drugs received by them from without or sent outside the State. Thus the record will indicate where large amounts are being used. These records are important for purposes of detection and enforcement as demonstrated in the administration of the Harrison Act, in showing leaks from the legitimate traffic into the illegitimate.

#### *Administration of Act*

The enforcement of the act is placed in the hands of the police authorities and courts throughout the State. The other administrative features are placed in the State Hospital Commission as affecting the professions and copies of Federal order blanks are filed with the police authorities. Peddling and other illegal traffic in the drugs are treated as crimes to be detected and punished like other violations of the law.

**In Re Appointing an Eye and Ear Specialist to Assist the Medical Inspector of Schools**—Senate Int No 317 (Print No S 321), by Senator Benjamin Antin of New York, concurrent Assembly Int No 370 (Print No 372), by Assemblyman Frederic S Cole of Herkimer County, is still in Public Education Committee in each House

The following letter, in explanation of the above bill, is published for the information of the members of the Society

The State Department of Education

Albany, February 15, 1924

MY DEAR DR VANDER VEER

I am just in receipt of yours of yesterday regarding the Reich and Cole bills. In reply I am pleased to advise you as follows

I have always been and am still opposed to State medicine. I do not believe that it is a function of the Education Department to practice medicine. This is a function that belongs strictly to the physician, and as an Educational Department we should encourage the physician so far as we can. I have already filed a memo with Commissioner Graves as follows

"The bill introduced by Mr Reich to amend the Education Law in relation to medical services in the schools of the State is the same as the Ullman bill of last year. This bill distinctly provides for State medicine for which, as a department, we cannot stand. The State Medical Society is unanimously opposed to the measure, and I feel as a department we should do likewise."

Regarding the Cole bill—we are greatly in need of more medical, dental and other assistants, to enable us to stimulate and supervise school medical inspection throughout the State. For several years I have recommended appropriations to enable us to strengthen our force for those purposes. The members of our staff, as you of course know, do not attempt nor are they privileged to practice medicine. They serve the State in purely a supervisory capacity. Should we obtain an expert on eyes and ears, his services would be utilized purely in a supervisory capacity and in training pupil teachers in our normal schools to make the simple Snellen test, to recognize defective vision, that children may be sent to physicians for proper advice and attention. It is my desire to be clearly understood in this matter by you and by the medical profession throughout the State.

I greatly appreciate your willingness to assist such legislation as might be necessary to strengthen our force to enable us to accomplish more of the real purposes for which school medical inspection is intended. Believe me,

Very sincerely yours,

WM A HOWE, M D,  
State Medical Inspector of Schools

**In Re Peddling Unpasteurized Milk**—Senate Int No 425 (Print No S 434), by Senator Chas Hewitt of Locke, N Y, concurrent Assembly Int No 642 (Print No A 651), by Assemblyman G S Johnson of Wayne County, will be dropped

**In Re Reporting Vaccinations to Local Health Officers**—Senate Int No 430 (Print No S 440), by Senator Wm Love of Kings County, concurrent Assembly Int No 565 (Print No A 568), by Assemblyman Frank H Lattin of Orleans County, the bill has been reported and is up for passage

If there is no request on the part of any member of the Society this bill will be dropped

**In Re Distribution of Information Concerning Results of Scientific Study**—Senate Int No 436 (Print No S 445), by Senator Michael E Reiburn of New York, concurrent Assembly Int No 588 (Print No A 592), by Assemblyman Joseph Gavagan of New York, referred to Judiciary Committee in each house, still in committee

Objection has been made to the above bill

**In Re Health Districts to be Created by State Commissioner of Health**—Senate Int No 448 (Print No S 457), by Senator Daniel J Carroll of Kings County, concurrent Assembly Int No 646 (Print No A 655), by Assemblyman Frank H Lattin of Orleans County, is still in Public Health Committee in each house

Information has come to your Committee on Legislation that abuses are prevalent on the part of tourists who are using the public lands and certain of the parks in the State which are of such great size as to be located overlying districts of local health officers who are reluctant to act in matters involving State territory, the bill has been introduced for the purpose of giving the State Commissioner of Health jurisdiction over such State lands in order that he may conserve the interests of the public health by action where the local health officers are somewhat negligent and allow nuisances to exist, especially from the sanitary point of view

Your Committee can see no reasonable objection to the bill and in fact, in view of the great tourist population of certain of the forest preserves and State parks, believes it is in the interest of the public health and is in favor of the measure, and unless there is comment offered by the members of the Society, the bill will be dropped

**In Re Violations of Local Health Orders**—Senate Int No 455 (Print No S 464), by Senator George L Thompson of Kings Park, N Y, concurrent Assembly Int No 513 (Print No A 515), by Assemblyman Edwin W Wallace of Nassau County, will be dropped

**In Re Refusal to Comply with Rule or Order of Local Health Board**—Senate Int No 459 (Print No S 468), by Senator George L Thompson of Kings Park N Y, concurrent Assembly Int No 542 (Print No 545), by Assemblyman Edwin W Wallace of Nassau County, will be dropped

**Amendment to Workmen's Compensation Law**—Senate Int No 463 (Print No S 477) by Senator Peter J McGarrv of Queens County, concurrent Assembly Int No 632 (Print No A 693), by Assemblyman A. I Miller of Westchester County, which has been referred to the Labor and Industries Committee in each house, this bill will be dropped

**In Re Deduction from Income Tax of All Expenses Paid for Medical, Surgical or Dental Services**—Senate Int No 527 (Print No S 543), by Senator John A Hastings of Kings County, concurrent Assembly Int. No 65 (Print No A 65), by Assemblyman Joseph Reich of Kings County, still in committee, this bill will be dropped

**The Child Experimentation Bill**—Senate Int. No 584 (Print No S 603), by Senator John P Ryan of Rensselaer County, no concurrent Assembly bill as yet, still in Senate Codes Committee

Too strong a representation on the part of the County Chairmen and County Society officers cannot be made to the introducer of the bill and to the Senate Committee on Codes and your Committee must be ready undoubtedly, to appear at a hearing reinforced by those who are most conversant with the subject, and yet the County Chairmen and County Society officers can be of great aid to your State Committee on Legislation if they will voice their protests to their individual representatives in the legislative halls

**The Anti-Vivisection Bill**—Senate Int No 588 (Print No 512), by Senator John P Ryan of Rensselaer County no concurrent Assembly bill as yet, the bill is still in Senate Codes Committee

The same comment may be offered as above in the Child Experimentation Bill, for un-

doubtedly those who are interested in this bill do not appreciate what the sciences have done in advancing public health and the extent to which the study in the art of healing of human ills would be retarded as has been evidenced in such countries which have attacked the good faith of the medical profession at large and have placed obstructions of this or a like nature in the way of progress

Senate Int. No 603 (Print No 629), by Senator Clayton R Lusk of Cortland, N Y. concurrent Assembly Int. No A 824 (Print No A 850), by Assemblyman Edmund Jenks of Broome County, would add new article 4-a, Domestic Relations Law, by providing child born out of wedlock shall be entitled to support and education by both parents and shall inherit from each in same manner as legitimate children Referred to Judiciary Committee in each house

No comment thereon, digest given for the information of the members

**State Education Department Bill to Amend the Medical Practice Act**—Senate Int. No 637 (Print No S 663), by Senator Daniel J Carroll of Kings County, concurrent Assembly Int No 888 (Print No A 927) by Assemblyman Frank H Lattin of Orleans County, which has been referred to the Public Health Committee in each house, which would amend sections 170, 171, 173, 174 Public Health Law, relative to practice of medicine. Every person now lawfully practicing and hereafter authorized to practice must register with the secretary of the board of medical examiners

**Comment** This bill has to do vitally with the medical profession and has been introduced at the request of the State Department of Education following conferences that have been held with the various state departments, in the hope on the part of the State Department of Education, that they may clear up and strengthen the medical situation in this State

Attention is called to the bill printed in full in the previous JOURNAL, and to the stand which the various County Societies have taken in regard to the general features of the bill The following counties have not expressed an opinion either "for" or "against" the general propositions, singly or *in toto*, as expressed in the bill, and the request is made that the bill be perused thoroughly and the decisions of the County Societies and of all others interested be transmitted to the Legislative Bureau Bronx, Cattaraugus, Chautauqua, Chenango, Columbia, Cortland Delaware, Herkimer, Lewis, New York, Onondaga, Oswego, Otsego, Steuben, Tioga, Wyoming, Clinton, Niagara

In the February 8th JOURNAL on page 126

your Chairman of the Committee on Legislation has called attention to the County Societies which do not seem to be of aid to the Legislative Bureau that they have helped in creating

Honorable criticism and constructive suggestions make for better understanding of a legislative procedure, and your Committee feel that they should be instructed from every angle relative to such an important move

Senate Int No 738 (Print No S 781), by Senator William T Byrne of Albany County, would add new sections 281-b, 281-c, Public Health Law, relative to practice of chiropody and podiatry Referred to Senate Public Health Committee

No comment

### ASSEMBLY

Medical Inspection in Schools Bill—Assembly Int No 66 (Print No A 66), by Assemblyman Joseph Reich of Kings County, is still in Assembly Public Education Committee No concurrent bill has as yet appeared in the Senate

It would seem that a bill of such a socialistic tendency is well cared for at the present time by the legislators in its negation

In Re State Institute for Study of Malignant Disease at Buffalo—Assembly Int No 195 (Print No 195), by Assemblyman Julius Berg of Bronx County, concurrent Senate Int No 175 (Print No S 175), by Senator Michael E Reiburn of New York, the Assembly Bill has been changed from Public Health Committee to Assembly Ways and Means Committee, see concurrent Senate bill for digest and comment

In Re Nursing and First Aid Services in Factories, etc—Assembly Int No 309 (Print No A 309), by Assemblyman Joseph Reich of Kings County, is still in Assembly Labor and Industries Committee, no action having been taken No concurrent bill has as yet appeared in the Senate

The Narcotic Bill—Assembly Int No 342 (Print No 342), by Assemblyman Morris Wemfeld of New York, concurrent Senate Int No 285 (Print No S 289), by Senator Morton J Kennedy of New York County

See concurrent Senate Int No 285 for comment

In Re Appointing an Eye and Ear Specialist to Assist the Medical Inspector of Schools—Assembly Int No 370 (Print No A 372), by

Assemblyman Frederic S Cole of Herkimer County, concurrent Senate Int No 317 (Print No S 321), by Senator Benjamin Antin of New York County, still in Public Education Committee in each house

See concurrent Senate Int No 317 for comment

In Re Distribution of Information Concerning Results of Scientific Study—Assembly Int No 588 (Print No A 592), by Assemblyman Joseph Gavagan of New York, concurrent Senate Int No 436 (Print No S 445), by Senator Michael E Reiburn of New York, still in Judiciary Committee in each house

See concurrent Senate Int No 436 for comment

In Re Health Districts to be Created by State Commissioner of Health—Assembly Int No 646 (Print No A 655), by Assemblyman Frank H Lattin of Orleans County, concurrent Senate Int No 448 (Print No S 457), by Senator Daniel J Carroll of Kings County, still in Public Health Committee in each house

See concurrent Senate Int No 448 for comment

State Education Department Bill to Amend the Medical Practice Act—Assembly Int No 888 (Print No A 927), by Assemblyman Frank H Lattin of Orleans County, concurrent Senate Int No 637 (Print No S 663), by Senator Daniel J Carroll of Kings County, has been referred to the Public Health Committee in each house

See concurrent Senate Int No 637 for comment

Assembly Int No 890 (Print No A 929), by Assemblyman Frank H Lattin of Orleans County, concurrent Senate Int No 376 (Print No S 380), by Senator Henry G Schackno of New York, would add new sections 446, 447, 447-a, Penal Law, forbidding sale of wood alcohol except as metheriol, and making it a felony to sell any article of food or drink or medicinal or toilet preparation for internal or external use, in which there is metheriol Referred to Codes Committee in each house

To date, February 18th, there have been 1,003 bills introduced in the Assembly, and 742 bills in the Senate

Action on Bills—Assembly Int No 195, relative to the control of the State Institute for the Study of Malignant Disease at Buffalo Reference has been changed to the Ways and Means Committee of the Assembly

**Committee Hearings**—Your Chairman appeared at a hearing on February 13th, before the Assembly Committee on Public Health, in relation to Assembly Bills Int No 232, 267 and 565

Your Committee on Legislation has received from the Committee on Live Legislation of the American Medical Association, Section on Laryngology, a tentative bill to safeguard the distribution and sale of certain dangerous caustic or corrosive acids, alkalis and other substances.

The purport of the bill seems to be proper and just and your Committee will favor the bill when introduced.

It is of interest to the Chairman of your Committee on Legislation to study the situation now existing in the State of Ohio where their law classifies the offense of illegal practice as a misdemeanor and a fine of \$25 to \$500 is the penalty, unless the affidavit states that the offense is a second offense then imprisonment is a part of the penalty and a jury trial is required.

It is of interest to note that illegal practitioners of one cult were prosecuted for illegal practice to the number of 386 cases during 1923, 326 were convicted, 24 were dismissed and 36 are still pending, and there are two inspectors employed who have since January 1st had 15 convictions and 50 cases pending.

The penalty section is, in the main, similar to the one vetoed by Governor Miller in our State some two years ago.

It has been noted in the Ohio situation that where chiropractors were involved the majority of them elected to go to jail rather than to pay fines, on the advice of the Universal Chiropractors Association of Davenport, Iowa, which protects its members in malpractice suits, agrees to pay fines and furnishes legal help in case of arrest for illegal practice.

Evidently the courts of Ohio are determined right and left that the practice of Chiropractic is the practice of medicine, and that those who are following this practice in the State of Ohio without first passing the Medical Board, as duly constituted there by law, are illegal practitioners.

## REPORT ON NARCOTICS

In the report of the Commissioner of Internal Revenue for the year ending June 30, 1923, just received, it is stated that 410 persons were registered under the Harrison Narcotic Law as importers and manufacturers, 2,256 as wholesale dealers, 45,536 as retail dealers 147,891 as practitioners, and 90,942 as dealers and manufacturers of untaxed narcotic preparations. During the year, 6,450,605 ounces of imported taxable narcotics was withdrawn from the customs custody for domestic consumption, which, added to the amount (2,312,695) in the possession of manufacturers, July 1, 1922, made a total of 8,763,300 ounces. Manufacturers exported 9,800 ounces of this supply or of drugs derived therefrom, and 2,393,844 ounces of like description was sold by them to domestic purchasers, leaving a total of 5,017,652 ounces with the manufacturers June 30 1923. An aggregate of 6,180,582 ounces of narcotic drugs was imported during the year, which is an increase of 3,480,706 over the previous year. During the same period 13,683 ounces were exported a decrease of 26,430 ounces over the previous year. Officials of the Federal, State, county and municipal governments and institutions, who are exempt as such from registration and payment of tax under the Harrison Narcotic Law, purchased a total of 9,398 ounces of narcotic drugs contained in stamped packages amounting to 83,606 taxable ounces. A total of 8,678 ounces of narcotic drugs and preparations came into possession of the gov-

ernment during the year through enforcing the laws which was a decrease of 62,473 ounces over the previous year. There were 4,194 convictions under the internal revenue narcotic laws for which sentences aggregating 4,692 years, and fines amounting to \$291,690.46 were imposed. The general attitude of the courts toward violators is reflected in the fact that the number of convictions during the year was larger by 1,050 than for the previous year. Penalties were assessed during the year (Section 3176, revised statutes as amended) against 29,776 registered persons for failure to register and pay special tax required, and 1,572 violations of the law were reported which involved other charges of greater significance. A total of 8,683 violations accrued during the year against unregistered persons, and 33,268 violations of all kinds against registered persons. Of the unregistered persons charged with violations, 3,953 were convicted, 1,093 cases were dropped, and 3,366 cases were pending at the close of the year, of the cases against registered persons collection of special penalty was made in 29,776 cases 241 persons were convicted 30 were acquitted, 452 cases were dropped and 2,035 cases were pending at the close of the year. The number of agents and inspectors in the narcotic field force averaged 176 for the year. The collections under the narcotic laws were \$998,197.41, a decrease of \$270,842.49 over the previous year.

## ASSEMBLYMEN BY COUNTIES

## ALBANY COUNTY

1st Dist, William J Snyder, Dem, 248 Madison Ave, Albany  
 2nd Dist, John A Boyle, Dem, 48 Bassett St, Albany  
 3rd Dist, Frank Wilson, Dem, 108 Hudson Ave, Green Island

## ALLEGANY COUNTY

Cassius Congdon, Rep, West Clarksville.

## BRONX COUNTY

1st Dist, Nicholas J Eberhard, Dem, 300 E 162nd St, Bronx  
 2nd Dist, Lester W Patterson Dem, 201 Alexander Ave, Bronx  
 3rd Dist, Julius S Berg, Dem 887 Forest Ave Bronx  
 4th Dist, Louis A Schoffel, Dem, 1387 Crotona Ave, Bronx  
 5th Dist, Harry A Samberg, Dem, 927 Fox St, Bronx  
 6th Dist, Thos J McDonald, Dem, 876 E 224th St, Bronx  
 7th Dist, John F Reidy, Dem, 636 E 183rd St, Bronx.  
 8th Dist, Joseph E Kinsley, Dem, 63 E 190th St, Bronx

# State Department of Health

## REPORT OF DR WADSWORTH ON THE EFFECT OF FREEZING TOXIN-ANTITOXIN MIXTURES

Following the occurrence of unfortunate reactions after the use of a toxin-antitoxin mixture which had been frozen, Commissioner Nicholl requested Dr A B Wadsworth, Director of the Division of Laboratories and Research of the State Department of Health, to make an investigation. Dr Wadsworth's report is as follows:

After exposure to severe cold, certain preparations of the diphtheria toxin-antitoxin mixture may become extremely toxic. In a neighboring State severe reactions in a group of children immunized with one preparation of the mixture have recently been reported and very carefully investigated. This mixture during transit had been exposed to "0 degrees F for approximately 48 hours." Subsequently experimental tests have been made by the Hygienic Laboratory in Washington with frozen samples of toxin-antitoxin mixture prepared in different laboratories. The mixture that incited the severe reactions was the only one of the series which became toxic. As a result of freezing, the toxin and the antitoxin became dissociated and did not reunite. However, preparations of toxin-antitoxin mixture which had been accidentally frozen have been administered without noticeable increase in the severity of the reactions.

An experimental test of the toxin-antitoxin mixture prepared by the Division of Laboratories and Research of the New York State Department of Health, made in March, 1922, for purposes of control, failed to demonstrate any material increase in toxicity after freezing. A precipitate developed but the toxicity was not materially increased. No reactions have been reported from the use of the toxin-antitoxin mixture distributed by the laboratory which could be attributed to freezing. However, no toxin-antitoxin mixture which has been frozen should be used.

## TRICHINOSIS IN NEW YORK STATE

Three separate outbreaks of trichinosis have recently come to the attention of the Department, vs 10 cases in Yonkers, 7 cases in Rochester with 3 fatalities, and 2 cases in Patterson, Putnam County. Laboratory confirmation of the diagnosis was obtained in every instance. The physician who attended the Yonkers cases is convinced that trichinosis is by no means uncommon in and about that city. According to his statement, such cases are usually diagnosed as grippé, and he emphasized the importance of a blood

examination (for eosinophilia) in every case of suspected grippé who has edema of the eyelids.

## TYPHOID CARRIERS IN NEW YORK STATE

On January 1, 1924, the State Department of Health had 90 persons on its list of typhoid carriers. None of these resides in New York City. This is a net gain of nineteen over January 1, 1923, twenty-one new carriers having been discovered. Three old ones were returned to the list, four died and one moved out of the State.

The twenty-one new carriers are known to have been responsible for sixty-nine cases of typhoid fever, not all, however, having occurred during 1923. One woman alone has been the source of sixteen cases during a period of twelve years.

## GOVERNOR'S RURAL HEALTH COMMITTEE MEETS

The first meeting of the Governor's Committee to investigate the status of rural medical practice was held February 1st at the office of the State Commissioner of Health.

The members of the Committee are Professor Dwight Sanderson of Cornell University, Dr Orrin S Wightman, President of the State Medical Society, Mrs Grace A Powell, President of the New York State Federation of Home Bureaus, Dr Grant C Madill, ex-President of the State Medical Society, Dr Stover of Amsterdam, State Senator Byrne of Albany, and Dr Matthias Nicholl, Jr, State Commissioner of Health.

After organizing permanently with Professor Sanderson as Chairman, the Committee agreed to study ways by which a careful survey could be made of some rural county, that the adequacy of medical service, especially in the more remote sections, might be definitely determined.

## BIOLOGICAL AND CHEMICAL PRODUCTS DISTRIBUTED BY THE STATE LABORATORY

During one recent month the State Laboratory in Albany sent out nearly 18,000 separate packages of biological and chemical products prepared at the laboratory for therapeutic and preventive use. Among the items were over four thousand 6,000-unit packages of diphtheria antitoxin, and 4,500 packages of diphtheria toxin-antitoxin mixture.

# THE DAILY PRESS

We are all interested in what the newspapers say about physicians and medical topics. To the credit of both the physicians and the newspapers, criticisms of particular physicians are seldom or never published, but the papers often publish criticisms of medical methods and procedures. On the other hand, the newspapers publish much about public health movements—probably because those who carry on the movements maintain efficient publicity bureaus. It is our intention to prepare a cross section of the medical news contained in the daily newspapers in order that physicians may know what the people think about them and their work. (The Editor)

The Niagara Falls *Gazette* February 11 contains an article with the double column heading "Anti-compulsory Medicine group wants toxin antitoxin treatment investigated." The article quotes the Citizens Medical Reference Bureau 145 West 45th Street, New York, as advocating an investigation into the ill effects following the use of frozen toxin-antitoxin mixtures, which were mentioned on February 15th in the Daily Press department of this journal. The article makes the most out of arguments against toxin-antitoxin. It first quotes the Summit, N. J., *Herald* as in turn quoting Dr. W. H. Park as saying that the toxin antitoxin is absolutely harmless. The *Gazette* goes on to say that the results in Massachusetts prove that such was not the case. It quotes Dr. Zingher's article on toxin antitoxin in the February 1st issue of the *JOURNAL*, and says "Dr. Zingher refers to experiments conducted on children in the local schools, with a large number of different mixtures of toxin-antitoxin and refers in a general way to very severe reactions in a number of cases." The article then gives quotations from Dr. Zingher's article, describing the reactions in children, and the results of inoculations into guinea pigs in which death occurred all tending to show the poisonous nature of the toxin-antitoxin. However, the *Gazette* refrains from comment on the article or the ill effects of the injections in Massachusetts.

The Binghamton and Syracuse papers carry accounts of the administration of toxin-antitoxin to school children in those cities. Apparently the propaganda against the immunization is not having much effect. The Albany *Journal* quotes Dr. Nicoll, State Commissioner of Health as saying "If Syracuse where one of the Milbank

fund demonstrations is being conducted, does not eradicate diphtheria within five years, I shall be very much disappointed."

The Watertown *Times* February 11, contains a column account of the expected action of the Board of Supervisors of Jefferson County in voting \$8,000 to maintain three public health nurses who shall cover the entire county. An office and automobiles will be provided for the nurses. The appropriation will be duplicated by an equal assignment of money from the Shepherd-Towner Funds of the State Department of Health.

This action by the Board of Supervisors is the direct result of the action of the Jefferson County Medical Society, which voted to petition the supervisors to appoint the nurses in expectation of the duplication of the funds by the State. The County Medical Society will continue to take a deep interest in the work through a committee of three physicians, who will supervise the work of the nurses. The Society was stimulated to take the action because of the high infant mortality in the county.

The physicians of Jefferson County are to be congratulated in setting a new standard of leadership in public health affairs by practicing physicians. We shall follow the demonstration with interest.

The Troy *Times* of February 12th contains a well-written editorial on the keep-well movement. While it ascribes much health value to a line of vigorous ancestors, it also calls attention to the satisfactory results of hygienic efforts. The text of the article was Dr. Haven Emerson's speech before the State Charities Aid Association, on February seventh.

The newspapers of Albany and vicinity carry an account of the appointment of Dr. Otto R. Eichel to take charge of the epidemiological statistics of the League of Nations. Dr. Eichel has been granted a six months leave of absence from the Vital Statistics Division of the State Department of Health in order that he may go to Europe to compile statistics there.

Dr. Eichel is a born statistician. He lives on figures and draws elaborate graphs for the same compelling reason that other persons paint pictures or compose orations.

The New York *Telegram* of February 13th contains an account of the death rate among the

people who are insured in the Metropolitan Life Insurance Company. The Company has 15,000,000 industrial policy holders, and in this group the death rate for 1923 was 9 per 1,000. The account states that the influenza epidemic of the beginning of the year prevented the rate falling below that of 8.8 for 1922, which was the lowest in the experience of the Company. This rate shows a considerable decrease from the rate of previous years. In 1919 the rate was 10.6, in 1917 it was 11.6, and in 1911 it was 12.5. The reduction in death rates is extremely creditable to the Metropolitan Life Insurance Company. Some companies take the stand that a reduction in death rates is of very little concern to them for they fix their rates according to the estimated deaths, and any money collected in excess of that needed to pay death claims must go back to the policy holders as dividends. But the Metropolitan Life Insurance Company places its work on broad humanitarian principles, and spends immense sums each year on public health nursing and other forms of preventive work among its policyholders.

The Buffalo *Commercial* of February 13th contains a discussion of the hospital needs of the city. It quotes figures given by Superintendent Lindbald of the Millard Fillmore Hospital. Three per cent of the population are usually sick at any given time or 16,000 in the City of Buffalo. It is estimated that about one in six of those sick requires or will accept hospital treatment. Various surveys show that 5 beds per 1,000 inhabitants will be occupied by the sick. This ratio exists in New York City, while in Buffalo there are 3.5 beds per 1,000 inhabitants, giving 1876 beds instead of 2,800 which the city should have. If the surveys show that 70 per cent of the beds are occupied, the occupancy is a fair average. New York City had 89 per cent of the hospital beds occupied in 1922. The percentages for Buffalo per beds occupied was 89 in 1918, and since then the percentage has been over 90 per cent and in 1921 it was 100 per cent. This indicates the overcrowding of the Buffalo hospitals and the need for more institutions. The Buffalo papers also state that the annual convention of the

American Hospital Association will be held in Buffalo on October 6th of this year.

The Buffalo *Express* of February 10th contains an article which is evidently intended to discredit health propaganda. It is entitled "Walk and be happy, but wear out your shoes," and concerns a walk-and-be-happy week in an Indiana town promoted by the Y M C A and Y W C A under the chaperonage of the Mayor. The article asks "Who pays the bills? People wear out shoes when they walk. The men behind the guns are the Associated Retail shoe dealers of the City."

The week is announced as a big success and one dealer has reported a sales increase of 46 per cent. Plans are being made for a walking week next year. The article continues "The trade publications do not reveal the identity of the religious or uplift organization that is to be chosen as a sponsor but we may be sure the right one will be found."

The Ithaca *Journal-News* of February 13 contains an account of an argument for a contagious disease hospital presented by Dr. L. T. Genung, the City Health Officer. He told of a girl coming down with scarlet fever in a family with several small children, and the difficulty of finding a place in which to care for her. He said that two lives were lost last year because of no place where the patients might receive proper care.

The Amsterdam *Recorder* of February 12 contains a column account of a report given by the Amsterdam representative who attended the Public Health conference of the State Charities Aid Association in New York on February seventh. After describing the program the article concludes by quoting from the address of Dr. Haven Emerson as follows: "We have almost reached our limit as to what can be done *to* you *for* you. We have come to the point where the things have got to be done *by* you, *for yourselves*, and until you accomplish that you will not get a great deal further." This is in line with the arguments that have frequently been heard from the floor at the meetings of the New York State Medical Society.

## NEWS NOTES

### BRONX COUNTY MEDICAL SOCIETY

A regular meeting of the Bronx County Medical Society, held at Concourse Plaza on February 20, 1924, was called to order at 9 P.M., the President, Dr. Podvin, in the Chair.

Dr. Sidney Cohn moved that we suspend the regular order of business and proceed with the election of new members. Dr. Gitlow amended the motion that in addition to the election of new members, the Society also take action in regard to the proposed Bill for Annual Registration of Physicians. The motion as amended was then carried.

Dr. Gitlow moved that the Secretary be instructed to cast one ballot for the following applicants for membership:

Emmanuel W. Billard, William Lenetska, Joseph G. Levine, Matthew A. Liotta, Isidor Mogil, William J. Walker, Carl Wurm, Jr., Maurice Meltzer (Associate).

Dr. Gitlow moved that the Society go on record

as in favor of the Bill introduced in the State Legislature providing for the Annual Registration of all Physicians and that notice of this action be sent to the State Society for publication in the *NEW YORK STATE JOURNAL OF MEDICINE*. This motion was discussed and strongly endorsed by Dr. Cunniffe, Chairman of the Committee on Legislation. The motion was then put to vote and was carried.

The program of the evening, arranged for the benefit of the members of the Society and their guests, thus being an Open Meeting, then proceeded as follows:

Illustrated Lecture with Colored Slides  
"Camping Along the Saskatchewan River,"  
Frank Richard Oastler, M.D.

Dr. Sidney Cohn moved that the Society give a rising vote of thanks to Dr. Oastler to express our appreciation for this wonderful lecture. This motion was seconded and carried.

It was moved and carried that the meeting adjourn.

The meeting adjourned at 10.50 P. M.

### LECTURES ON TUBERCULOSIS AND INDUSTRIAL HYGIENE

A six weeks' combined course on tuberculosis and industrial hygiene for medical practitioners has been arranged at the Academy of Medicine under the joint auspices of the Public Health Committee of the Academy, the New York Tuberculosis Association, and the Division of Industrial Hygiene of the New York State Department of Labor.

The purpose of the course is to focus the attention of the physicians of this city on such problems of tuberculosis and industrial hygiene as would be of practical assistance to them in their professional work.

The lectures will be held at the Academy of Medicine on Tuesday and Friday afternoons at 4.30, beginning March 14th and ending April 22nd 1924. Two lectures of thirty minutes each, one on tuberculosis and the other on some phase of industrial hygiene will be given at each session. An additional half hour will be devoted to answering questions from the floor.

Enclosed is a schedule of the lectures with the topics, names of lecturers, and dates. It is of a size that can be easily inserted in the pocket appointment book.

Physicians are cordially invited to attend these lectures.

*March 14*  
4.30 p.m. Prevalence and Distribution of Tuberculosis in New York City—Haven Emerson, M.D.  
5.00 p.m. Industrial Poisonings and Diseases.—Leland E. Cofer, M.D.

*March 18*  
4.30 p.m. Industrial Neuroses—Michael Osnato, M.D.  
5.00 p.m. Tuberculosis in Children.—Charles Hendee Smith, M.D.

*March 21*  
4.30 p.m. Etiology and Immunology of Tuberculosis.—Allen K. Krause, M.D.  
5.00 p.m. The Diagnosis and Treatment of Lead and Copper Poisonings.—William E. Ramsay, M.D.

*March 25*  
4.30 p.m. Carbon Monoxid Poisonings—Charles Norris, M.D.  
5.00 p.m. The X ray—Its Use in Diagnosis and Treatment.—C. E. Hamilton, M.D.

*March 28*  
4.30 p.m. Treatment of Tuberculosis—J. B. Amberson, Jr., M.D.

### George Crabbe Brought Up to Date

But now our quacks are gamesters and they play  
With craft and skill to ruin and betray,  
With monstrous promise they delude the mind,  
And thrive on all that tortures human-kind

How strange to add in this nefarious trade  
That men of parts are dupes by dunsters made,  
That creatures, nature meant should clean our streets  
Have purchased lands and mansions, parks and seats,  
Wretches with conscience so obtuse, they leave  
Their untaught sons their parents to deceive,  
And when they're laid upon dying bed,  
No thought of murder comes into their head  
And then in many a paper throughout the year,  
Must cures and cases, oaths and proofs appear,  
Men snatched from graves as they were dropping in,  
Their lungs coughed up, their bones pierced through  
the skin

And chiropractors is their latest name,  
The sturdy spine they give an evil fame,  
Distorted vertebrae gangrene the lung,  
And dandruff from a crooked spine is sprung  
The rotten bladder-slough will grown anew,  
And pus will vanish as the morning dew,  
The spirochete we all may scoff and puff  
If we'll but hold our backs erect and stuff  
When dogma such as this can gain assent,  
The world's askew and not the spine that's bent  
'Twas ever thus, and ever will be thus  
While men keep patent their esophagus

What then our hopes?—perhaps there may by law  
Be method found these pests to curb or awe,  
Yet in this land of freedom, law is slack  
With any being to commence attack,  
Then let us trust to science—there are those  
Who can their falsehoods and their frauds disclose,  
All their vile trash detect, and their low tricks expose.  
Perhaps their numbers may in time confound  
Their arts—as scorpions give themselves the wound,  
For when these cures dwell in every place,  
While the cured, we not a man can trace,  
Strong truth may then the public mind persuade  
And spoil the fruits of this nefarious trade.

—STEPHEN J. SPITZER, in *Bronx Bulletin*

Fair Patient Oh, doctor, what do you recommend  
for tired, fagged-out brain?

Doctor Well, fish is a great brain food

Patient What kind of fish?

Doctor Why, for you, a couple of whales might be  
about right to start with.—*Brown Jug*

## SOME ABNORMALITIES OF THE URINARY TRACT IN THE MALE, WITH SURGICAL METHODS OF CORRECTION \*

OSWALD SWINNEY LOWSLEY, A.B., MD, F.A.C.S

NEW YORK CITY

### ABNORMALITIES

#### Introduction

**C**ONGENITAL malformations met with in the urinary tract often assume considerable importance and sometimes may be of vital significance

Due to the perfection of instruments of precision, chiefly the cystoscope and X-ray apparatus, we are now able to investigate cases which were formerly beyond our reach. The greatest recent advance has been the discovery of a safe pyelographile media with which the upper urinary tract may be outlined

It is impossible to even mention all of the variations from the normal that occur in the urinary tract so it is thought best to discuss a few cases of each type with a brief mention of the surgical significance.

#### MALPOSITION OF THE KIDNEY

**Unilateral Dystopia**—Our routine investigation of a case in the cholec disclosed the fact that the patient had a fused kidney located on his right side with two ureters entering the bladder at their usual locations. The upper kidney pelvis was connected with the right ureter, the lower was connected with the left ureter. The lower kidney pelvis connected with the left ureter was infected and located just under McBurney's point. Pus was obtained from the catheter inserted into this ureter

While the patient was under treatment for pyelitis he had an accident and was rushed as an emergency case to another hospital. We were notified and immediately communicated with the surgeons as we felt that they should be informed of the infected kidney pelvis in a location noted for abscess of the appendix.

Dr Clark has collected data regarding renal

and ureteral anomalies in 4,215 routine autopsies and I quote from his work freely

Acute military tuberculosis in two cases

*Cause of Death in the 62 Cases of Anomalies*

—The variations seldom played an important role. Deaths occurred, as a rule, from causes totally unrelated to the congenital defects

1 A congenital absence of a kidney was found twice in the series of 4,215 consecutive cases. Piersol<sup>4</sup> states that this happens about once in every 2,650 individuals

Extreme congenital atrophy of one kidney, almost to the point of its absence, was found in four more cases

Marked congenital atrophy, a fibro-cystic mass of small size, was recorded in ten additional cases

Extreme cases of congenital cystic kidneys forming large masses were found six times

This forms a total of 22 cases in which the change was limited to the right side in eight cases, to the left side in nine cases and being bilateral in the others

Therefore, about 0.5 per cent of the series were cases in which one side could not have been safely relied upon to assume the duties of the other in case of its incapacity from disease or injury and nephrectomy would have been contraindicated in this group of cases under any circumstances

2 The "Horseshoe Kidney" occurred 7 times or about once in 600 cases. Piersol<sup>4</sup> states that it is found about once in 1,000 cases. There is usually a marked malposition of the horseshoe or fused kidney to a position low in the abdomen over the psoas muscle groups or in the pelvis. This can lead to wrong conclusions when found by palpation over these regions

3 Congenital dystopia of a kidney either in a

Read at the Annual Meeting of the Medical Society of the State of New York at New York City May 22 1923

FIG I Horse shoe kidney, in which the renal structures are arranged in four separate groups, with each group drained by its ureter. These join high up, so that only two ureters enter the bladder.

FIG II Case of bilateral double kidney, in which the kidney pelvises are separate on the left side and connected on the right.

unilateral or its bilateral fused state occurred 15 times. A low position in the right iliac fossa or over the right sacro-iliac joint in 6 cases and in 6 more cases in a corresponding position on the left side. The location was three times over the median line in the lumbar region or over the promontory of the sacrum. Thus there was one case in every 281 individuals showing a low malposition of one or both organs. This can easily lead to confusion in palpation of the pelvic and low abdominal regions.

4 No accessory kidney was encountered. The number of kidneys was reduced to one by fusion in seven individuals and by a congenital absence in two additional individuals.

5 Ureters. Multiple ureters (unilateral or bilateral), going as far as the pelvic brim or sometimes as far as the bladder wall before fusion to empty as one normal channel, were found in 10 cases.

Complete doubling of the ureter was found in 10 cases.

Complete absence of a ureter was recorded in two cases and extreme atrophy of a ureter in eight more cases.

Short ureters were associated with all cases of renal dystopia. In all, there were 40 cases in the series which presented some form of a variation but a multiple ureter which empties into the bladder as one channel is probably the variation which might cause the greatest difficulty in diagnosis, since ureteral catheterization without associated radiographic assistance might yield little knowledge of the functional state of such a kidney. The pelvis of a kidney is frequently divided and a given branch of the ureter would, therefore, drain only a fractional part of the kidney.

About one in every 100 cases had some form of a ureteral variation. Therefore, for good orientation in the study of these tracts, a combined ureteral catheterization, instillation and radiographic examination is indicated if confusion is to be avoided.

6 Variations in number or origin of the renal arteries were noted in 40 cases, but this by no means represents all that were present. They probably have little or no clinical importance except to the surgeon during nephrectomy.

7 Veins. There were 25 variations found, but these were practically all associated with cases of renal dystopia.

8 Anomalies were slightly more frequent on the left side than the right side, while in about one-fifth of the series some form of a variation was bilateral.

9 Serious developmental defects were common enough in the renal apparatus to justify a careful examination of the entire system before directing radical surgical intervention against one

side Congenital cystic kidneys, usually bilateral, are probably the most serious variation so far as danger to life is concerned through the simple presence of the anomaly itself

Some developmental defect in the system was found in 147 per cent of the 4,215 consecutive cases. About one-third of these were capable of causing confusion in diagnosis and treatment

10 Race This did not appear to be an important factor in the incidence of the anomalies

11 Sex. Nearly all the cases in the series examined were males, therefore, little can be said as to sex incidence. Fifty-three cases were in males and nine cases in females

12 Age Most of the individuals lived a normal length of time or died of a disease or accident that was totally unrelated to the presence of the anomaly

13 There was never a consecutive series of more than 380 cases in which a renal variation of one character did not appear

14 No sustained effort was made in many parts of the series to search for minor vascular and ureteral variations near the pelvis of the kidney nor for divisions in the pelvis

Exaggerated kinking of the ureter was more or less frequently noted at the points where normal constrictions in the ureter are expected to occur

*Malformation of the Kidney*—Unilateral double kidney is of fairly common occurrence. Nearly all of such cases, seen by the urologist are infected in one or the other pelvis, sometimes both

Treatment of infections in malformed kidneys is the same as that in other kidneys. The first step is to get rid of all infected or questionable teeth, tonsils or other foci of infection in accordance with the splendid research of Bumpus who has been able to reproduce kidney infections and stones by repeated injections of organisms from carious teeth. The patient is put on urinary antiseptics and the kidney pelvis involved is irrigated with an appropriate antiseptic solution. Only as a last resort is the kidney removed

Bilateral double kidney we have seen once. All four pelves were infected and on the right side the upper pelvis and lower communicated with each other. This case has been reported by Drs Kingery and Kirwin

Other malformations, such as fused kidneys of various sorts are important and recognized by pyelography

An important congenital lesion of the kidney from the surgeon's viewpoint is bilateral cystic kidney. Three cases have been met with in our clinic since Christmas and a beautiful specimen

FIG. III Picture of wax model of polycystic kidneys (Dr Pool's case)

presented to us by Dr Pool of the general surgical service, and of which our artist has made a

FIG. IV Pyelogram of polycystic kidney, showing typical cupping of the distorted kidney pelvis due to encroachment of the cysts upon it.

wax model This condition presents a typical pyelographic picture which is unmistakable The treatment of polycystic kidney is never nephrectomy Ordinarily the less done to such a case the better In case of grave abscess formation in such a kidney nephrotomy and drainage may be performed as a last resort

FIG V Congenital stricture of ureteral orifice, resulting in dilatation of the lower end of the ureter Easily cured by slitting the orifice by means of the operating cystoscope.

*Abnormalities of the Ureter*—Stricture of the ureter is more liable to be of infective origin than congenital, although the latter unquestionably does occur The best example of the congenital form is stricture of the ureteral orifice of which we have several cases The treatment is universally successful and consists of merely incising the ureteral orifice with the small scissors through an operating instrument

*Abnormalities of the Bladder*—The abnormalities of the bladder which are of most importance are, extrophy, incontinence due to congenital sphincteric deficiency, double bladder, hour-glass bladder, etc

Surgical intervention in extrophy is of two sorts The commonest procedure is to transplant the ureters into the large intestine at different sittings The mortality from ascending infection of the kidneys is high It seems to be more fa-

vorable in children than in adults The other procedure is the reconstruction of the bladder and penis, which is always a complete epispadias.

*Abnormalities of the Urethra.*—These are so varied and interesting that one could fill a large volume in their discussion Two cases that have come to the author's attention are deserving of mention

*A Case of Complete Epispadias with Incontinence of Urine*—Patient. J L C, Jr, six years of age, walked into the hospital in good health Well developed and nourished boy, with negative clinical history, presented a congenital deformity of penis with all characteristic symptoms of a typical pubo-penis epispadias in the third class or complete epispadias with incontinence

The little patient had worn a diaper for the past four years and had history of very little control of urine, that is, he knows when he wishes to void, but is unable to control urine

Patient was examined carefully X-ray picture was taken before introduction of the catheter, and after the introduction of No 14 F catheter into the bladder, about fifteen c c silver iodide solution was injected into the bladder and X-rays taken

This X-ray examination of the bladder before and after cystogram shows considerable separation in the symphysis pubis The injection was not definitely opaque, but faintly showing, suggesting an abnormally low location of the bladder

Patient was examined under ether The corpora cavernosa were noted as a huge mass inferior to the urethral opening, which latter consisted of an infundibulum-shaped passage just above the corpora extending into the bladder

The foreskin consisted of a loose tab of skin lying underneath the corpora and without particular shape or form and recognized by its consistency Both testicles are descended and present in scrotum No hernia, no other deformities made out The kidney function was tested by p s p reaction Both kidneys had good function and good concentrated amount of phthalein made out

The first operation done on this case was done on May 6th, 1922, under gas-ether anæsthesia The first stage of the operation was the suprapubic cystotomy accompanied by dissection of the bladder neck

Patient in dorsal position, incision in midline as usual for cystotomy Bladder exposed and peritoneum stripped back as far as possible This was done with considerable difficulty owing to the fact that in a child of this age the peritoneum is more adherent and reflected lower than in older individuals

Peritoneum noted as particularly thin Blad-

der opened in midline and contents evacuated. A small rubber catheter which was previously introduced into bladder was identified.

Digital examination of the vesical neck showed it to be moderately relaxed, presenting roughly a triangular form and the tip of the index finger could easily be inserted into the orifice. The bladder was previously found to contain about six ounces of fluid.

The bladder was mobilized from its attachments anteriorly and freed up as far as its attachment to the symphysis. The vesical neck was divided superiorly and a wedge-shaped piece excised and then a through and through suture of chromic gut passed through with a boomerang needle tightening the sphincter. It was noted

FIG VI Picture of wax model of repair of congenital epispadias with incontinence of urine. Penis is entirely reconstructed and patient has good control

that following this compression the catheter could be withdrawn with moderate difficulty thereby indicating a moderate increase in constriction as the result of the procedure.

The bladder wall was sewed up in the midline and a rubber cystotomy tube sewed firmly in position. The muscular tissues were loosely approximated with plain gut interrupted—fascia with chromic and skin with interrupted silkworm gut with a rubber tissue drain inserted in the space of Retzius.

*Second Operation*—One month later, after period of suction drainage, the second operation was done under gas ether anesthesia. The operation consisted in the plastic repair of the congenital deformity of the penis.

Usual picric acid preparation of skin and genitalia. The suprapubic opening made at the previous operation was noted as almost closed. This

was enlarged slightly and fitted with a close-fitting rubber tube with an accompanying smaller enclosed tube for suction drainage. A tight connection was made between this outer tube and the skin so as to insure adequate fixation for the tube giving ample opportunity for permanent drainage.

The penis was then put on a stretch and the urethral mucosa was represented by a long funnel-shaped arrangement of tissues. The lower portion of this extended to the glans penis, mucosa incised and blunt separation made between this mucosa and the tissues just inferior to the symphysis. This was stripped back for a distance of about one and a half inches until the external sphincter fibres which were well defined were made out. These were tightened around the urethra in a criss cross fashion with sutures of plain gut. A grooved director in the urethra during this procedure gave indication of amount of tension and increased sphincteric action exerted by these sutures.

The urethral mucosa on the lower aspect of the urethra was then separated at its most external portion from the underlying corpus cavernosa and denuded until the entire corpus could be picked up between the index finger and thumb. Separation was partially accomplished on the opposite side but at this point a moderate amount of union between the urethra and corpus was left intact in order to supply vascularity to the newly formed urethra and urethral mucosa.

The freed surface of mucosa on the right side was then turned over a grooved director and united with the freed edge of the opposite side with sutures aimed to approximate the healing surfaces. The glans penis was partially incised and its outer edges brought together forming a new meatus. This closure was effected for a distance of two inches.

The corpora were then united superiorly over the newly made urethra and this line of sutures reinforced. Union of skin surface was accomplished covering over the entire organ.

A small dead space at the root of the penis just inferior to the symphysis was closed with buried sutures of silkworm gut and an attempt made to obliterate this space insofar as possible. A small rubber tissue drain was packed gently into the upper portion of the wound at this point. A catheter was then passed into the bladder and found to meet moderate resistance throughout the entire urethra. The presence of the grooved director in the urethra throughout the union of the mucosa prevented any of the sutures from buttonholing the urethral mucosa.

The entire area was then carefully cleaned with alcohol and wet alcohol dressing placed on the row of sutures. A gauze dressing was reinforced with an overlying dam of rubber tissue which was then sealed to the skin by collodion.

It was observed that the suprapubic drainage by suction worked well and there was no leakage observed into the wound

*Third Operation*—Patient recovered pretty well from this operation and three weeks later a third operation was performed to attempt the reconstruction of the anterior urethra, which had partially broken down. Under gas-ether anaesthesia, incision made on either side of the corpora cavernosa and the union of the two corpora was again attempted. The suprapubic drainage by suction was left in position and after three weeks the patient went home.

*Fourth Operation*—Later, about one month, the patient returned, and another attempt to reconstruct the anterior urethra was made.

This time, as before, this was not very satisfactory on account of the stitches loosening and the outer portion of the urethra broke down due to pressure. The glans penis was deeply incised.

*Fifth Operation*—Three weeks later further attempt to reconstruct the anterior portions of the urethra was made. This time the glans penis was split entirely through and apparently prevented its healing and exerting pressure whereby the wound was broken down. In this last operation a perineal drainage tube was inserted in order to keep the upper portion of the reconstructed urethra dry.

The patient at the present time is entirely cured and his condition is very satisfactory. The sphincter shows signs of successful reconstruction, the patient has better control and incontinence is not observed.

J. M., aged three and one-half months, was admitted to the department of pediatrics at Bellevue Hospital on July 30, 1913, as an urgent case. He had a temperature of 105 degrees, and died a few hours after admission, with oedema of lungs. The only history obtainable was to the effect that the child had been ill for a few days only, and the mother had noticed nothing unusual about its micturition.

*Autopsy Was Performed*—In the dilated posterior urethra are observed a number of prostatic duct openings. The verumontanum is peculiar in that six small bands are seen extending from the apex of the trigonum vesicae to the largest portion of that structure, where they seem to become imbedded in and form an integral part of it. At its widest portion, the verumontanum measures 3 mm. At this same point it is 3 mm in height. At its lowermost portion, a particularly interesting arrangement is noticed. Ordinarily the verumontanum, which is formed by the ingrowth of the Mullerian and Wolffian ducts and their accompanying muscular coats, as described previously by the author,<sup>1</sup> becomes smaller and smaller at its lower portion

FIG VII Congenital stricture of posterior urethra, resulting in bilateral hydroureter and hydronephrosis. This condition could have been easily repaired by merely passing a small sound, which would have ruptured the diaphragmatic membrane which sealed off the posterior urethra. Site of stricture marked by arrow.

where its fibres, about 1 cm below its upper end in a specimen of this age, finally disappear by spreading out on the floor and sides of the urethra in from 2 to 6 strands, some of which attach themselves to the walls. In this case some of the tissue of the verumontanum is disposed in the usual way, but a considerable portion of it continues down to the membranous urethra, where it divides into two portions and then attaches itself intimately to the entire urethral circumference with the exception of a very small slit-like opening on the floor of the urethra, just to the left of the median line which is lined with mucous membrane and could be penetrated with a fine probe.

The manner in which the division into two rather thick membranous bands occurs, and their attachment to the entire circumference of the urethra with the exception of a small aperture on the floor to the left of the median line, and also the fact that the entire structure is more or less dome-shaped, make the term "diaphragm" seem most appropriate in referring to this anomaly. Almost complete obstruction to urinary outflow is caused by this unusual arrangement.

Below the point of blocking, the bulbous urethra is considerably dilated.

There is a very large hydrocele of the right cord. Both testicles, the vasa deferentia, seminal vesicles, and the prostate are normal in appearance.

**Urethra.** The dilated prostatic urethra is lined with epithelium of the transitional type, resting upon a felt-work of fibro-elastic bundles under which is a thickened submucosa. The verumontanum is interesting in that, by the use of Van Gieson's stain, it is observed that while there is a sprinkling of muscular elements throughout it is at its lower portion made up mostly of connective tissue fibres. It is quite vascular throughout its entire length the vessels being rather more numerous and considerably larger than is usually the case. Cross section at the point of obstruction shows a very small slit-like lumen lined with stratified epithelium, resting on

a felt like base under which is a very thick submucosa. Surrounding this there is an exceedingly extensive area rather densely arranged, made up of connective tissue and smooth muscle fibres. There are a number of dilated vessels quite thickly scattered throughout this tissue.

This entire condition if recognized early could have been cured by merely dilating the posterior urethra in order to allow drainage.

### EPITHELIOMA OF THE TONSIL \*

By LEON H. SMITH, M.D.

BUFFALO, N. Y.

**M**Y brief remarks this afternoon concern the clinical study of 40 patients afflicted with epithelioma of the tonsil and adjacent structures. There is possible source of error in the far advanced cases as to the primary site of disease, whether it be the tonsil proper or the pillar. The border line base of tongue types are not included in our study. Sarcomata are not considered. These patients were all treated at the State Institute for the Study of Malignant Disease, Buffalo, New York. Each patient admitted has a personal and medical history, general physical examination, Wassermann, which is repeated if doubtful, biopsy, complete urinalysis, blood count and chemical blood as the occasion demands.

Obviously it is not within the scope of these few cases to attempt formulation of criteria of radiation therapy from the viewpoint of the radiologist. However the clinician, after all is the one who expressly desires to be informed as to what can be offered his patient. Unfortunately but little attention has been centered upon tonsil malignancy, being generally considered a rare clinical entity and usually classified under mucous membrane neoplasms of the oral cavity.

Historically we find the first scientific publication on record was in 1812 by Baile and Cayol of

Paris. These authors differentiated the scirrhus or indurated type from the soft ulcerated condition. Since that time the names of Lambert, Newman, Hess, Delavan and others have been associated with tonsil malignancy. The more recent literature has been limited to isolated case reports with the exception of a comprehensive resume of the subject by Mathews in 1911 of Mayo Clinic and a discussion and review of methods of treatment by Quick of New York Memorial Hospital in 1922.

There is a frequency which deserves our attention although it is quite possible that few of those present have ever met with many malignant tonsils, especially in private practice. Of the 3,000 malignant patients treated at the Institute we have a record of 45 proven cases by biopsy. Laryngeal epithelioma commonly considered much more prevalent has not shown this to be true in our small series. We have 50 case records of laryngeal malignancy. Five case records have not been studied, three of these were not admitted for treatment because of their utter hopelessness and advanced moribund condition, the other two have incomplete follow-up records.

Cancer is at all times a live medical problem and from early times identified as an incurable and fatal disease. Much of the ancient history and literature reflects considerable light on this prevalent disease. About the year 800 B. C. we find in

\*Read at the Annual Meeting of the Medical Society of the State of New York at New York City May 23, 1923.

India extirpation of the new growth with the subsequent application of salve to prevent recurrence as the prevailing treatment. Later cautery was used particularly for its hemostatic effect. Arsenic paste came with the Renaissance. It is most interesting to note that in 1773 Peyrille won the Dijon Prize for stating that not only was it difficult to cure cancer but equally difficult to define it.

One should consider cancer as a definite clinical entity, part of the individual and not one disease but a combination of diseases which attacks each individual in a different manner and may vary from time to time in the same individual with no recognized etiological factor.

Schonholz considers cancer under three periods of life:

- 1 Disease existent unknown to host
- 2 Patient confronted with symptoms
- 3 Time consumed by the physician in diagnosing and instituting treatment

We have no means at our command to attack the first problem. The second phase must be controlled by education of the public at large. Cancer Week is but a recognized outgrowth of the due necessity of an early recognition of this prevalent disease and this holds true particularly in tonsil malignancy where the symptomatology is not only early but the part most accessible. We as physicians are most concerned with the third phase as not only is it a question of professional reputation but the means of alleviating if not the saving of our patient. An early diagnosis is absolutely essential in this work.

All patients presenting themselves for diagnosis and treatment are classified into four groupings, which is purely arbitrary and schematic, being often a question of personal equation, yet it is the only method by which we attempt to check up the progress and results of our patients. It is not with forethought to cover faulty technique or offer an alibi for failures that patients are so classified but rather to determine the activity of any given method of treatment.

Group I New growth confined to tonsil. General physical condition excellent.

Group II Early cervical metastases. General physical condition good.

Group III Metastases well marked. General physical condition poor.

Group IV Hopeless with advanced toxic cachexia.

A brief study of case records reveals the following:

Sex incidence Male 36, Female 4

Age Varied from 28 to 82 years with the average age 55. Approximately 60 per cent oc-

curred during 5th and 6th decades of life. Bryant reports youngest case on record, male 18.

Previous Medical History Only 12 patients admitted previous attacks of sore throat or tonsillitis.

#### Habits

a Tobacco factor most prevalent 75 per cent excessive

16 used excessive amount of tobacco

11 excessive pipe and chewing combination

6 moderate use cigars and cigarettes

3 did not use nicotine in any form

b Dental element 50 per cent carious teeth

10 marked dental caries

7 moderate dental caries with pyorrhea associate

3 upper and lower plates

Others not remarkable

Venereal History 2 patients had positive Blood Wassermanns. Both of these cases did poorly from the onset, one being in Group I and the other in Group IV.

#### Chief Complaints

1 Sore throat and discomfort 50 per cent at least

2 Enlarged cervical nodes with no throat trouble 6 cases

3 Pain in ear as only complaint in two patients

4 Difficult swallowing was only complaint in one patient

5 Dysphasia occurred only in far advanced cases in cachectic stage

It is noteworthy that at least 60 per cent of patients were classified into Groups III and IV. The duration of symptoms varied from two weeks to 14 months before admission. The vast majority of the cases classified in Groups I and II had symptoms dating between 2 to 3 months while those in the later cases were between 4 to 6 months. Three fulminating cases appeared in the operable cases. Less than 25 per cent of the patients admitted were biopsied. An effort was made to ascertain the period of time lapsing before the physician sent the patient to the Institute for treatment. During this time no treatment was given except mouth washes or local application of mild caustics.

No. of Patients	Duration of Symptoms
2	1 month
1	2 months
2	3 months
2	4 months
2	6 months

## Admission Groupings

- Group I 4 cases
- Group II 10 cases
- Group III 14 cases
- Group IV 12 cases

From such an arbitrary classification it can be readily seen that over 60 per cent of our patients are in the late operable and inoperable class which is a great factor in treatment

## DIAGNOSIS

A proper biopsy is performed on each patient. It may not be amiss at this time to mention several precautions regarding this minor procedure. Before removing tissue for histo-pathological study it is well not only to inspect the tonsillar region posterior, pillars, lateral pharyngeal wall, base of tongue and floor of mouth but to gain further knowledge by direct palpation. This method is most valuable in determining the degree and extent of infiltration. A small section is desired from the most suspicious area. It is unwise in the presence of dental caries or oral sepsis to remove a large section for diagnosis. The element of secondary infection within the oral cavity is a very potent factor and its presence greatly inhibits radiation therapy. I personally use small bone ronguer with sharp edges or the usual ethmoid punch. Always follow with abundant alkaline mouth washes to minimize added infection.

**Case Report.** A prominent jurist of this state had a large section of tissue removed from right tonsil and anterior pillar six weeks prior to consultation. Pathologic report was mucous membrane epithelioma. The amount of secondary infection when I first saw the patient simulated an active Vincents Angina. The patient was in good health for his active life of 62. No further section was advised in view of his sepsis and discomfort. Placed on alkaline mouth wash and had him report in two weeks. At this time his sepsis had quieted and a small section from anterior pillar reported as inflammatory. However the induration was suspicious, his Blood Wassermann repeatedly negative, and in view of his history 512 m.c. hours of radium emanations were embedded into tissue proper with the new radium pack to cervical regions. The patient did poorly after one week and during the post therapeutic period it was quite evident that the trauma or mutilation of tissue at first section had only driven the cells to deeper areas. The patient eventually died from hemorrhage following erosion of oropharyngeal vein. A section prior to terminal event reported active epithelioma.

A positive histo-pathological section is characterized by large flat epithelial cells in 90 per cent of this series. It is very rare to observe pearl formation and we were fortunate to have one.

Clinically, we must rule out the possibility of

gummata, tuberculoma, benign neoplasms as papillomata, sarcomata, Vincents Angina, etc. While the age of the patient is basic, the appearance of the lesion varies considerably, either broken, infiltrated tonsillar surface with tendency to irregularity, or ulcerating, fungating surface covered with some slough surrounded by an infiltrating, hard border. In the latter type bleeding is much more profuse. Never overlook the fact of coexistence of syphilis or tuberculosis with cancer. After all is said, the best reliance is the microscopical section under proper conditions.

## TREATMENT

In the earlier patients we resorted to frequent X-ray treatments as known in those days, not the high-powered machine. The results were in a vast majority unsatisfactory. Some of the early operable types showed retrogression of the neoplasm and improvement in the general condition of the patient but this was only a matter of few months, temporary. All the fungating, ulcerative types made little progress and the patient gradually went downgrade. The cervical metastatic nodes were reduced 50 per cent when oral sepsis was at the minimum and the general condition was favorable. The hopeless type case was in reality made worse in many instances even though the dose was small.

During the past three years we have progressed in the number of patients relieved or clinically well by a "combined method of treatment." Radium emanations in glass beads are inserted or implanted into the growth direct where they remain to slough out or become encysted.

In order to wall off the cellular activity and migration we apply either deep X-ray or the new radium pack to cervical regions. The greatest lesson is to respect the element of secondary infection not only locally but also its influence upon the general physical condition of the patient. In my opinion the presence of an active sepsis is an absolute contraindication in any inoperable as well as some borderline cases for either radiation or radium treatment. I have observed to some extent that deep X-ray causes less untoward reaction than radium in the presence of secondary infection. Whether other men interested in this field have observed this I cannot say. It is a question whether it is advisable in the early case and most favorable one for a clinical cure to subject the lymph channels and nodes to repeated radiation as we may destroy too much of nature's protection. Often it is difficult to decide definitely the nature of the cervical enlargement, whether due to products from radiation locally tonsil infection deposit of active cancer cells or combination of same.

There is no one method of treatment as each case is a case unto itself and no dogmatism can produce results. The general care of the patient is

essential, general hygiene, diet, rest and above all the proper psychological status, all aid in accomplishing the end result. Up to date our results have not been startling but this is quite consistent when the majority of the patients were well advanced before treatment was instituted. Of this series 23 patients received combined treatment, 5 fractional radiations and 12 radium packs. Three patients are clinically well and performing regular duty for 2 to 3½ years. Many others are doing their work although the new growth has not disappeared and cervical metastases are palpable.

It suffices to state that surgery to date has not offered the patient much hope, the radical operations are attended with a high operative mortality, recurrences are common and a new field must be exploited. Serums, vaccines and detailed surgical statistics will not be considered at this time.

In placing the radium beads or seeds into the new growth particular attention must be directed toward the anterior pillar with its relationship to the tongue and floor of the mouth as well as to the base of the tongue, which is rich in lymphatic supply and extends to lateral wall of the pharynx. It is not uncommon to have the growth completely destroyed and healed for several months to find to your chagrin that cellular activity has taken place at these two sites. Secondary involvement of the tongue was noted in four patients, lateral pharyngeal wall was involved in three patients. The most resistant are the fungating growths which extend from tonsil inferiorly invading the base of the tongue. The centre of the lesion is free from cellular activity while the border shows

marked undermining and heaping. This heaping in many instances has resisted the most intensive dosage and would invade the floor of the mouth and eventually the cheek. We treat the cervical nodes most conservatively and do not resort to radical dissection en bloc. Our cases are too few at present to test the wisdom of this action but we hope to use the deep X-ray in such a manner to block off lymphatic chains.

Seventeen patients have died, 8 from hemorrhage, usually venous structures, 2 general sepsis, 4 suffocation due edema epiglottis and pharynx and 3 profound toxemia. A marked toxic cachexia was in male, age 38, who had a generalized carcinomatosis involving all the palpable nodes, this being a rather rare condition complicating a primary epithelioma of the tonsil. In Group II there are at present three patients with a favorable clinical progress. Group III only five patients showed any marked degree of permanent improvement, while in the last group none improved and many made worse by treatment.

#### Prognostic Values

1 Those patients with exception of fulminating type of disease whose duration of symptoms was from one to three months were favorable to treatment.

2 After three months more resistant to treatment while after six months were inoperable and most unfavorable.

In concluding my remarks I wish to plea for an early diagnosis, a more prompt institution of radiation therapy and thereby allowing greater activity in an attempt to secure an increasing number of clinical cures.

## HYALITIS OF INDETERMINATE ETIOLOGY

By JOHN J O'BRIEN,

SCHENECTADY, N. Y.

COMPLETE or partial loss of transparency of the vitreous humor is among the most serious conditions that the ophthalmologist is called upon to treat. At present there is not complete agreement on the anatomic structure of the vitreous body. There are two views<sup>1</sup>. The older one being that it is a semi-gelatinous structureless mass, while the later view is that it is a gelatinous substance the center core being fluid or nearly so with a definite lamellated structure and a limiting membrane. Benson<sup>2</sup> in 1894 called the profession's attention to a form that he named monocular asteroid hyalitis. Examined by the ophthalmoscope the vitreous was perfectly transparent but woven all through it, in their

various forms and shapes resembling the starry heavens, were innumerable smooth, fixed spheres of a light cream color. In the case cited by Benson the acuity of vision of the affected eye, when compared with the patient's other eye, was as good as the latter. The eye, however, could maintain a sustained effort only for a short interval. Argyll Robertson, of pupillary fame, presiding at the meeting when Benson reported his case, said that he had an exactly similar case except that the vitreous opacities were freely movable. Neither of these eminent ophthalmologists had any idea of the nature of these bodies. In 1921, Verhoeff<sup>3</sup> studied thirteen cases of asteroid hyalitis in his own thorough and complete way, and established to his satisfaction that

these bodies were not an excretion from other tissues but were primarily formed in the vitreous as calcium soap mixed with insoluble compounds of cholesterol and lecithin. Verheoff believes that the conditions requisite for the development of asteroid hyalitis is intraocular angio sclerosis combined with an altered condition of the blood.

Another type of hyalitis characterized by dust-like opacities was investigated by Straub.<sup>4</sup> He clearly demonstrated that these were leucocytes in the vitreous as were the deposits on Decemets membran in cyclitis. Straub injected the vitreous with pathogenic bacteria. These attracted leucocytes from the vessels of the ciliary body, the choroid and retina. There was no increase in the white cells of the latter. Then he injected the ciliary body when he found on sectioning the eye that there were no white cells in the vitreous but that lymph and corpuscles filled the vessels of the ciliary body itself. The deduction from these studies is that the infective material changed the cell reactions of the vitreous body making them chemotactic to the white corpuscles of the blood, and acted in a similar way on the ciliary body, choroid and retina. When Straub infected the ciliary body with T B bacilli and produced a granuloma, there were but few white cells in the vitreous, but there was a slight swelling of the optic nerve and the nerve cup was filled with leucocytes. This observation may be of much practical value, for in cyclitis a slight haziness of the optic nerve and swelling of the immediately adjacent retina is said to be nearly always present. These tissues are sensitized by the toxins of the cyclitis and become chemotactic to leucocytes.

Synchysis scintillans has also been long recognized, although the mechanism of its production admits of various hypotheses. The most accepted of these is that cholesterol crystals are present in a fluid vitreous. When the eye is moved the light reflected from the moving crystals resembles a shower of shining particles. Just how the cholesterol is deposited in the vitreous and where the crystals are actually formed—within or without the globe—awaits further investigation.

Another type of hyalitis, to which I invite your attention is quite common. It varies from the faintest haziness of the vitreous to absolute opaqueness. With the aid of most skillful laboratory technicians and commanding the most complete laboratory facilities and equipment, I have been unable to determine the cause of the hyalitis in the illustrated cases, and many others, to which I wish to call your attention. There was no injury in any of the eyes, and cyclitis, uveitis, iritis, choroiditis, retinitis, syphilis, tuberculosis, portal congestion and anemia were ruled out. In one of the cases there was, and had been for ten years, an extensive skin lesion of which the pic-

ture presented gives a very good idea. This had become so much a part of the patient's existence that she did not even mention it till discovered by the nurse. Whatever, if any, causal relation there may have existed between the dyscrasia from which the skin lesion followed, and the hyalitis must remain pure conjecture.

A female, age 60, had always been in poor health. Early in the Fall of 1922, her vision gradually dropped until she could neither read nor sew and the outdoors took on a smoky look. Her vision uncorrected was

R. 20/50-1 J 18

L. 20/100 J 0

Examination of the right eye showed a slight conjunctivitis, and position and movements of the globe normal. The cornea and media were clear, the pupil reacted to light and accommodation, the anterior chamber was normal in depth, the iris was a good color and free from new blood vessels, atrophy or increased connective tissue, the lens was transparent, the vitreous was somewhat hazy but free from opacities. The vessels, disc and retina were seen with a fair degree of clearness. They were apparently normal. The anterior segment of the left eye was the same as the right but the vitreous was so hazy that a good retinal reflex was all one could see. Under vigorous treatment the vitreous cleared sufficiently to make examination of the retina, disc and vessels fairly satisfactory. They were similar to those of the right eye. This improvement was, however, not permanent, the haziness reappeared and the vision again dropped. There was no improvement from subsequent treatment. Her teeth had been extracted, one or two at a sitting, many years ago, so apical abscesses and pyorrhea were eliminated. The blood and spinal fluid Wassermann were negative. A searching examination of the blood and urine disclosed nothing abnormal. Transillumination and X-ray of the sinuses were normal, as were the nares and pharynx. Examination of the nasal sinuses, at frequent intervals over a period of months, revealed no pus. Repeated refractions failed to improve the vision. It remained, as did the condition of the eyes, permanent, and the factor or factors underlying it has baffled our united efforts to unravel them.

A male, 69 years old, noticed in April, 1922 that his vision seemed dim, and that he could see better on dull than on clear days. His eyes had never been injured and at no time had they been inflamed. They were never red nor did he have the slightest discomfort in them. On September 5, 1922 his vision uncorrected was

R. 10/200 J 0

L. 10/200 J 0

Examination of the blood spinal fluid and urine showed nothing abnormal. X ray's of the

teeth and sinuses were normal. Close observation of the nasal sinuses at numerous examinations threw no light on the condition. There was no tonsillar tissue present and his general health and personal habits were exceptionally good. Examination of the right eye showed that the cornea was clear, media slightly hazy, the pupil active, the disc a solid white, physiological cup and lamina cribosa with increased connective tissue in the disc. The arteries were moderately sclerotic and the fundus was apparently normal. Examination of the left eye showed it to be the same as the right eye. Vision corrected was

$$\begin{aligned} R + 2.00 \text{ sp} &= 20/200 \\ L + 2.00 \text{ sp } ( ) + 0.50 \text{ cy ax } 0.90 &= 20/100 \end{aligned}$$

A month later the vision had dropped to 20/200 in each eye. This was his poorest vision, for by the end of November the vision had gradually risen with correcting spheres to 20/30. There has been a steady improvement for by February, 1923, the uncorrected vision was

$$\begin{aligned} R &20/200 \\ L &20/200 \\ \text{corrected by} & \\ R + 2.25 \text{ sp} &= 20/20-3 \\ L + 2.25 \text{ sp} &= 20/30-4 \\ \text{add } +350 \text{ sp} &= J 3 \text{ for each eye} \end{aligned}$$

The near vision, you will notice, is not so good as we usually get with this distant vision, for it is not uncommon in ordinary cases to get with this vision J 1.

The high points of this case are

- 1 The marked loss of vision
- 2 Its further drop under the treatment that brought about the excellent recovery
- 3 Failure of the laboratory to discover any abnormality in the blood, spinal fluid or urine
- 4 Failure to find a focus of infection in the mouth, nasal sinuses, nasopharynx or tonsils
- 5 Failure of a careful examination by a very competent internist to find any disease in any organ

On June 19, 1922, a woman, age 53, gave a history of being ill for the past three weeks with pleurisy. At that time she complained on and off of pain in her right forehead and adjacent temple. When this pain subsided, her right eye reddened. The eye had been annoying her for the prior three weeks, and at times she had had a feeling of discomfort in her left eye. The patient was a short, stocky, vigorous woman who had always enjoyed good health, except for psoriasis of more than ten years duration. The pain, discomfort and redness of her eyes were not periodic but came and went at any time. Examination of the right eye showed the conjunctiva quite red with no pericorneal congestion

or tenderness. The cornea and media were clear, the anterior chamber slightly shallow, the iris of a good color, it reacted promptly to light and accommodation. The disc, vessels and fundus were normal. There was a slight flushing of the conjunctiva of the left eye that was bleached white with adrenalin. In all other respects the eye was normal.

$$\begin{aligned} \text{The vision was} & \quad R \ 20/50 \\ & \quad L \ 20/20-2 \\ \text{The tension was} & \quad R \ 27 \\ & \quad L \ 30 \end{aligned}$$

Eleven days later there was but little discomfort in the right and none in the left eye. The latter was white but some redness remained in the right. July 13th—She had some pain in right brow and adjacent temple, and a little while later it moved into the right eye. The right eye became again intensely red, but there was no change in the tension, vision, pupil, media, vessels or fundus. Three days later there was again marked improvement, and the fields for white, red and green were normal. The condition steadily improved and the eye felt and functioned as well as ever. But on August 10th, the old pain in the old way and in the old place returned and the eye again became red. There was injection of the scleral vessels and the lids were edematous. There was no change in the anterior chamber nor iris, but the retinal reflex was lost and the vision was light perception. The acute symptoms gradually subsided but with no improvement in vision. She retired on the night of August 24th, feeling fine. When she awoke next morning she could barely see light and when I saw her the same forenoon the left eye was similar to what the right had been at the time its vision was lost. I sent her to the hospital where she was thoroughly examined by two internists who found nothing abnormal. One of these had been her attending physician for ten years. All the tests known to a modern laboratory were invoked but added nothing to my knowledge of the etiology. The hemoglobin, leucocyte count, red blood count, color index, differential count, Wassermann, blood sugar, blood culture, urea nitrogen, uric acid, nonprotein and creatinine were all within normal limits. As before stated, she had had, however, for at least the past ten years psoriasis covering nearly all her body, exclusive of her head and face. The accompanying photograph shows the extent and severity of some of the skin lesions. It is not probable that they had any relation to her eye condition for the latter was recent, the former an old story. At this time the patient became more or less irrational and had to be restrained. On September 1st, she was quiet and considerable vision had returned to her left eye, for she could see the dresser, the mirror and the flowers on it.

Her condition was unchanged until September 3rd, when at noon she lapsed into unconsciousness and two hours later passed quietly away.

In attempting to explain the loss of transparency of the vitreous it occurred to me that it may have been brought about in this way. Owing to the failure of one or more organs to function properly, or to an occult focus of infection, a poison is retained that ought to be neutralized or excreted. In some unknown way the vitreous becomes sensitized to this poison and is chemotactic to it. From this follow all the phenomena narrated with the now slow and again rapid clouding of the vitreous. That a chemical change takes place in the vitreous of the affected eye follows, for only one eye may be attacked while the poison has equally ready access to the other. So it seems as if there were at least two factors in these cases of loss of transparency of the vitreous.

First. A protoplasmic poison of unknown origin and identity is in the general circulation.

Second. In an unknown manner the vitreous is so altered that it attracts this poison and becomes chemotactic to it with loss of its transparency. The problem, then, is to accurately determine these factors. He who solves them will be of incalculable aid in treating disturbances not only of the vitreous, but of all the tissues of the eye, and may be of inestimable help to a clearer conception of disease in general and eye diseases in particular.

### NEWER POINTS IN COLITIS THERAPY\*

CLARENCE W. LIEB, A.M., M.D.

NEW YORK CITY

RECENT biochemical studies in the diagnosis and treatment of intestinal intoxications<sup>1</sup> have given us new insight into that much misunderstood and all too common condition which we call chronic colitis. Although today there is practically unanimity of opinion that bacteria play the major role in the causation of colitis the newer laboratory investigations lead us to believe that enhanced toxin production through bacterial activating agencies is the basic factor responsible for the pathology and symptoms characteristic of this disease. The frequency with which histamin is found in chronic colitis and the extraordinary physiological reactions produced by this amine leads to the conclusion that it may be the specific factor in producing colitis. The work of Manwaring, Monaco and Marino<sup>2</sup> leads us to infer that the mucus discharge from the colon is an explosive edema due to the absorption of histamin. This extraordinary tissue reaction induced by histamin suggests the possibility that several misunderstood disease entities such as rhinorrhea, bronchorrhea, leucorrhea, 'catarrh' of the stomach, gall bladder or urinary bladder, retinal or cerebral edema may be due to this same cause.

Tissue infection such as intestinal ulceration or mesenteric adenitis is probably a secondary stage and the result of edema and lowered tissue resistance produced by histamin. Bacterial activation, therefore, by sugars and intermediary

products of proteid cleavage is the fundamental factor and the one at which our therapeutics must be directed. If the condition were due to an infection we would expect a fibrinous exudate with leucocytic destruction and other constituents of inflammatory exudation. But these are conspicuous by their absence. The most chronic cases may show nothing more than a dilated gut with a thin or atrophied wall, or hard, ropey segmental contractions. Scattered throughout are to be seen localized areas of congestion. Toward the sigmoid region small varices may be seen which are undoubtedly the source of the blood which we occasionally see in colitis. The entire mucosa in long standing cases is usually injected, thus presenting a wide surface for the absorption of toxins into the blood. These poisons reach the neuro-circulatory structures of the organism, the cerebro-spinal and splanchic tracts and thereby explain most of the symptoms present in colitis. The "secretory neurosis" explanation of the disease must be discarded, and again re-emphasizes the fact that as our knowledge of pathology increases the number of diseases to which a neurotic origin has been ascribed steadily decreases.

The onset of colitis is so imperceptible and insidious that it is easily overlooked and is not discovered until its chronicity is fairly well established. Constipation sooner or later develops, and then it is that a life of intestinal invalidism or of colonic rectitude is started, depending on

the corrective measures adopted for its alleviation. Mechanical irritants such as fecal scybæ or an over residuized diet, chemical irritants introduced into the bowel in enemas and irrigations, and the abuse of cathartics are factors which prepare the soil for better bacterial proliferation and implantation.

One of our greatest clinicians<sup>3</sup> of a decade ago poignantly remarked that "It is to be hoped that but few physicians will be called upon to treat a case of colitis at the outset of their career, for if so, they will be apt to think that they have made a serious mistake in the choice of their life calling."

In the treatment of colitis our efforts must be two-fold, first to correct the toxæmia, and secondly, to rectify the pathology. The former is accomplished by the biochemical regimen outlined *infra*, the latter by physical agencies such as diathermy and hydraulic dilatation. This latter method is easy of abuse. We justly can criticize the haphazard use of the enema, plain or unscientifically medicated. In atonic conditions overdilatation of the already relaxed, inelastic colon or the application of irritating or corroding chemicals such as are so recklessly used by present day faddists and lay irrigators can do irreparable harm. In spastic conditions, however, adhesions may be stretched or broken up and spasms counteracted in a manner analogous to the dilatation of strictures in the urethra, œsophagus or pylorus. Carefully executed hydraulic dilatation has a definite place in the treatment of colonic spasticity so often the cause of symptoms in colitis.

The advantage of normal gastric secretion as a factor in the prevention of intestinal intoxications has perhaps been insufficiently emphasized. The action of the free acid of the gastric contents either destroys or checks the multiplication of pathogenic bacteria, as has been repeatedly demonstrated by different investigators. Hence it stands to reason that virulent organisms draining into an achylic or hypochlorhydric stomach from tooth, tonsil or sinus, and those carried in contaminated food, readily gain entrance to the intestine and there are subject to the activating influences to be discussed later. Every case of colitis should therefore have a gastric analysis, and wherever there is an acid insufficiency, some preparation of hydrochloric acid should be given to both assist the cleavage of proteid and to inhibit or destroy bacterial activity. The stomachs of colitis patients are usually dilated and ptosed, the gall bladder often pathologic, and the small intestine the seat of disturbed innervation and perverted secretion. Hence our therapy must be an inclusive one, else our patients and our reputations may suffer immeasurably.

Colitis is a far more frequent malady than is commonly thought. In 315 routine stool examinations of patients suffering from some type of

chronic illness mucus was found in 227 cases in large amounts. Only cecal specimens show the real colonic pathology which undoubtedly accounts for the many discrepancies in fecal reports and expert opinions. Rectal specimens from constipated people are alkaline, thus causing solution of the mucus and a great reduction in bacterial volume due to d'Herelle activation in the lower colon. The modern toilet gives the individual little opportunity to notice his evacuation, hence a colitis may often reach a severe stage without the patient being aware of copious amounts of mucus in the stool.

The writer has come to look upon the presence of mucus in the stool, no matter whether in gelatinous or membrane state, and no matter how little in amount, as of pathological significance. Although the intestinal tract is lined with goblet cells which are constantly discharging mucus into the fecal mass, all the mucus normally disappears by going into solution when the cecum is reached. This can be readily shown by adding acetic acid to a watery extract of the stool. Now in order to form membranes the mucus is precipitated by a ferment which Roger<sup>4</sup> and River<sup>5</sup> and Tremolieres have identified and named mucinase. This ferment is formed when an inflammatory condition of the mucous membrane exists. These same investigators found that bile salts had an inhibitory action on the production of mucinase. They likewise found that in chronic colitis biliary secretion was sub-normal.

There is no class of patients as indifferently treated as the chronic colitic. His symptoms usually are not severe enough to prevent him from following his vocational bend, but he does it under difficulties. Surely if a focal infection in tooth, tonsil or sinus can produce serious metabolic disturbances, how much more extensive should be the physiological derangement where the quantitative production of toxins is as marked as it is in chronic colitis. And yet, patients, because of the ambulatory nature of their condition, are very loath to give as much time or attention to their colitis as they would if they were suffering from a hæmorrhoid, a fistula or chronic appendix. And I am confident that the underlying cause of colitis is responsible for more disturbances of the heart, kidneys, arteries or nervous system than any other condition.

The treatment of colitis should never be undertaken without a careful physical survey for localization of infective foci, a thorough gastrointestinal series, proctoscopic examination and a comprehensive feces study. Many cases of diverticulitis, polyposis, early malignancies, pressure necrosis, kinks, etc., which may simulate colitis symptomatically and otherwise are thus excluded. By following this rule true colitis cures would be more common than they are. A fluoroscopic examination of the colon with the patient recumbent gives us, by watching carefully the

rate and character of the barium inflow, much valuable information as to motor activity and pathological anatomy. And right here I wish to make a plea for the more general use of the proctoscope and sigmoidoscope in the study of our cases. Amœbic and simple ulcerations, inflamed crypts, and intestinal or prostatic neoplasms are frequently disclosed which otherwise would be overlooked. At this point, though somewhat irrelevant, the writer wishes to direct attention to the frequency with which dermatological lesions are associated with mucosal pathology. Which is cause and which is effect it is often difficult to determine. The writer has seen mucosal pathology of the colon in early syphilis, psoriasis, acne, and urticaria. I believe that many dermatological lesions have mucosal counterparts at some stage of their development. Embryologically, this would seem reasonable.

A careful feces examination is a prerequisite to colitis therapeutics. The reaction, amount of mucus, evidence of pus, blood or blood coloring matter, presence of intestinal "fauna" (amœbæ, helminths or their eggs), all give positive or negative evidence of extreme value. When it comes to a study of the intestinal flora we are entering a practically unexplored field, in spite of the splendid investigations of Herter, Kendall, Rutger and others.

The present tendency in fecal work, owing to the infinite types and strains of bacteria in the human stool, is away from the specific identification of these types. Aside from the Shiga bacillus and possibly B. Welchii, the other Gram positive organisms are apparently of little pathological significance. The Gram negative organisms are the chief toxin producers. The study of their various toxins, and of their physiological effects, have attracted the attention of some of our keenest pathologists and clinicians.

Neuberg<sup>9</sup> has shown that nearly all reducing substances act as yeast activators. Von Wasserman and Ficken<sup>7</sup> demonstrated the effect of such activating bodies in enhancing the production of toxic substances by intestinal bacteria. D Herelle<sup>8</sup> has discovered a bacteriolytic phenomenon of tremendous interest and potentiality for colonic therapeutics. Barger and Dale<sup>6</sup> demonstrated the toxic property of histamin, an amine from the amino-acid histidin, and its presence in the colon. Abel and Kubin<sup>10</sup> have shown that 1/200 part of a grain of histamin is lethal to a guinea pig in 3 to 5 minutes. Mellanby and Twort<sup>11</sup> isolated a Gram negative organism capable of converting histidin into histamin. Koessler<sup>12</sup> in 1919 showed that histamin is formed only in a highly acid environment and that the acid in question is formic. Connellan has repeatedly called attention to the presence of formic acid in stools and has demonstrated its toxic action on himself. Recently oxalic acid has been frequently found

in the feces of patients suffering from pathologic (Lieb<sup>13</sup>) states. Baldwin<sup>14</sup> has demonstrated the toxicity of oxalic acid in animals and man. Its elaboration in the colon has been shown to be due to bacterial activity. In 1921 Patty showed that the B. pyanocyanous produced HCN in fairly large amounts. This organism has been found in human stools on several occasions. It is a deadly poison, even infinitesimal amounts producing constitutional symptoms. Henriques<sup>15</sup> has shown that acetone can be generated in the intestines as the result of bacterial activity. In 1922 Renshaw and Fairbrother claimed they had found an organism which could break up starch with the formation of acetone and other substances. Berthelot and St. Danyss-Michel examined the feces of 32 persons not suffering from diabetes, and have not once found organisms which elaborate acetone from starch, but they found such organisms in 17 of 22 cases of diabetes.

In the writer's 227 cases of definitely diagnosed colitis the following findings are noteworthy.

Mucus. Amounts variable but always present usually copious.

Reaction. 185 strongly acid to cresol red, cresol purple and cresol blue.

Histamin present in 191 cases.

Oxalic acid present in 110 cases.

HCN 2 cases.

Histamin and oxalic acid together 84 cases.

From the foregoing there is some justification in likening the colon to a huge test tube incubating many types of bacteria. The analogy, however, is not an exact one, for activating media and new strains of bacteria are constantly pouring into this breeding chamber, toxins are absorbed from it and waste products pass out of it, both of which in test cultures have inhibiting effects on bacterial growth. It is, therefore, logical to conclude that in the majority of colitis cases the pathology is due to the action of one or more of these toxins exerting their irritant effects directly on the intestinal mucosa and indirectly through the production of a generally lowered tissue vitality or an explosive edema of the mucous membrane.

Hence, when it comes to treatment, general as well as local rest is essential for the quickest and best results. The patient as well as the pathology should be treated. Rest in bed in pleasant surroundings is important. A room in a hotel is preferable to a crowded hospital when cost is not a consideration.

For the average case of colitis the following dietetic regimen has been followed.

While taking the chemical clyster treatment

the patient adheres rigidly to a low residue and low nitrogenous diet. The restriction of proteid is suggested by the work of Harries, who shows that tryptophan absorption in the absence of indol producers may give rise to toxic symptoms, particularly hyperthyroidism. When *B. coli* are implanted low residue proteid is added, namely, white meat of chicken, fresh fish, sweetbreads, calves' liver, eggs and lactic acid milk. After the implantations the diet is so planned as to give a low residue breakfast and luncheon and a high residue, low starch and sugar-free dinner.

To produce the least amount of intestinal unrest a residueless diet (so called) should be given. Owing to the divergence of opinions once held as to the etiology of colitis it is not to be wondered at that both low residue and high residue diets have been advocated by leading authorities. The variable character of the disease, constipation often alternating with diarrhea, is responsible for this dietetic error. The recent routine use of the X-ray and proctoscope have elucidated the pathology of the disease for us so vividly that our common sense tells us that where inflammation and spasm exist there we must enforce stasis of the part and freedom from mechanical irritants. We have good reason to believe that the majority of cases of constipation, not the habitual type or that due to mechanical causes, are the result of a low grade inflammation or edema such as the explosive type produced by histamin in which Nature tries to enforce the principle of rest, but does so in a bungling fashion. It is the writer's firm belief that the modern tendency of the dietetic pendulum to swing so far in the direction of the high residue diet is greatly increasing the number of gastro-intestinal invalids in this country. Ulcer and colitis are unquestionably on the increase.

The high residue diet and the high sugar consumption per capita work together for harm, the former mechanically carrying the activating sugar to the bowel, thus enhancing toxin production. No matter how meritorious agar-agar may be considered in the treatment of colitis there is evidence to the contrary due to the sugar-carrying power of the agar. This sugar-carrying power may be used advantageously, however, if the indicated sugar is given. A contra-indicated sugar taken with agar alone can do no harm, for it is practically all absorbed before it reaches the lower bowel, but taken with a meal, especially a high cellulose one, or when hyperperistalsis is present, it can do harm. Agar-agar for this reason should not be taken during active digestion.

In severe cases of colitis jejunal feeding is often advantageous. Gastric rest allows that organ to regain its secretory function and contractibility, since the larger per cent of colitis cases have hypo-chlorhydric and hypotonic

stomachs. As one of the aims of treatment is to lessen peristalsis, jejunal feeding by negating psychic secretion and inhibiting gastric mobility prevents maximal peristaltic activity in the intestines.

Our therapeutic sheet anchor in the treatment of chronic colitis therefore is the rigid enforcement of gastro-intestinal rest. Fifty years ago Hilton<sup>16</sup>, in that much neglected medical classic "Rest and Pain," enunciated a medical principle which should be the basis of all cures. "Growth," says he, "is the antitype of repair, prefiguring the physiologic capabilities of existing structures to repair themselves. So intimate is the association between rest and growth as to make them appear, on a superficial view, to stand to each other in the relation of cause and effect. Accurate observation of the animal and vegetable world certainly reveals their perpetual co-existence, and growth, as a rule, seems to proceed, *pari passu*, with physiological rest."

The residueless diet in use by the writer in the treatment of extreme cases fulfills all the immediate dietetic needs of the patient. From two to three thousand calories of it are given daily. It consists of orange juice, butter (melted) or 40% cream, lettuce juice, gelatin 10%-20%, lactalbumen (as best tryptophan source), dextrin or lactose. These foods may be given together or separately at two hour intervals, eight times daily. Patients not only tolerate this dietetic regimen well but improve in appearance and feelings from the start. Some alkali, Vichy, Kalak water, or preferably Tribasic Citro-carbonate, to increase the alkali reserve of the blood, should be given along with this diet.

Jejunal feeding should be kept up from two to three weeks, after which a lacto-farinaceous diet with pureed vegetables should be allowed for two weeks, and the patient after this gradually placed on a general, well balanced diet. Milk acidified with lactic acid (one half drachm to the quart) should be liberally taken as a tryptophan source, which latter is an excellent biological feeding media for *B. coli* and therefore increases indol production.

Medicine has very little place in the treatment of colitis. Belladonna, gr 1/10 of the extract every 3-4 hours inhibits peristalsis and in very hypertonic cases, especially with colic, the drug does much good. In some cases benzyl benzoate acts much better than belladonna. Cathartics are obviously contra-indicated. Adrenalin should be given to practically every case of histamin intoxication, especially in hypotensive cases. The experiments of Kellaway and Cowell<sup>17</sup> justify this therapeutics. Bile salts also have a definite rationale in the treatment of colitis.

Diathermy, in the writer's experience, has proved to be a valuable help in treatment. According to Sampson<sup>18</sup> "The hyperæmia causes

(by diathermy) increased metabolism in the part by dilating all blood vessels opening up lymph channels, activating phagocytes, as well as increasing their numbers in the area, activates the enzymes and increases osmotic processes. The traveling through the part of such inconceivably rapid oscillations produces a vibratory effect upon each molecule. The inhibition of bacterial growth by the high temperature produced is inevitable.

With proper technique the patient can take from 800 to 1,500 M. A. for twenty minutes and feel the beneficial effects of the treatment for hours. It is really quite extraordinary what great relief this treatment gives to ulcer cases as well as colitis colicosa types.

The application of the mercury-vapor quartz light to the abdomen and back unquestionably is of value in treatment and has been used by the writer as an accessory treatment in a few cases of long standing colitis with apparent benefit. Orr<sup>19</sup> and his co-workers concluded that the ultra violet radiations which cause large amounts of calcium and phosphorus to be retained in the organs of rachitic infants affect absorption from the intestines. Experiments are now under way to determine whether the calcium deficiency which has been noted in many patients from whose feces oxalic acid has been extracted, can be corrected by light therapy. Cramer and Drew<sup>20</sup> have shown that the mercury vapor quartz light increases the blood platelets in the blood. It is a known fact that conditions which stimulate the production of platelets will check the development of certain types of bacterial infections.

The newer colitis therapeutics is primarily a bio chemical one. Although we have scarcely scratched the surface of knowledge pertaining to the bacteriology of the colon we have laboratory and clinical data obtained both through carefully controlled experiments and also through trial and error methods which look very promising. There is, of course even today, a wide divergence of opinion as to what constitutes a normal intestinal flora. Some months ago the writer sent a questionnaire to a selected group of internists and pathologists qualified to speak authoritatively on the bacteriology of the colon. The answers were, indeed interesting! The questions pertaining to the practicability of colonic implantations of bacteria and the rationale of the acidophilus or colon bacillus implantations respectively were answered very cautiously. The answers ranged from absolute derision of either method to complete enthusiastic acceptance of one or the other methods. Now, it seems to me that, for the enlightenment of many of the less favored members of the profession who, because of inadequate facilities or distance from research centers, must be followers and not leaders, this problem should be settled. Commercial laboratories and many physicians are enthusiastically vaunting the merits of the *B. Acidophilus*. The

yeast cell has apparently had its day! Careful laboratory workers here and abroad are giving to the much maligned colon bacillus attributes which if true, will revolutionize the treatment of pathologic colon states as well as endocrine, neurological and vascular disorders.

We are all entitled to an opinion. But opinions are often fallacious. An unbiased mind, carefully checked up laboratory investigations and a sufficiently large group of test cases are essentials for the proper evaluation of a therapeutic agent whatever it may be.

The writer has used the same non bacterial therapeutic methods in the treatment of colitis for nearly four years, and during half of this time acidophilus cultures both by mouth and bowel were used, and during the other half of the time *B. coli* implantations were given. In this way he has been able to clinically check up on the merits of the respective methods.

Those who have had a large experience in observing the effects of *Acidophilus* milk cultures in chronic intestinal dysfunctions must admit this form of therapy has some merit. Its corrective influence continues, however, only during the period of active consumption of this milk. From our studies of the biological requirements of *B. coli* we are led to believe that the role of *Acidophilus* milk is a secondary one, and can be explained as follows. Tryptophan is essential to the production of indol whose influence in the endocrine balances in the body has been recently brought out by Langdon Brown<sup>21</sup> and Harries<sup>22</sup>. Indol is produced by the action of *B. coli* on Tryptophan. In experiments by Connellan with the object of adding Tryptophan to *B. coli* cultures for implantation, the method was found to be impractical owing to the tremendous cost of this preparation. In searching for the best Tryptophan source it was found that lact-albumen contained this amino-acid in the largest amounts. Is it not logical to conclude therefore, that *Acidophilus* milk, owing to its production of lactic acid and consequently lact-albumen, may play a very important part in the activation and nutrition of *B. coli*? According to Hiss and Zinsser *B. coli* produce lactic acid when grown in a dextrin or lactose media. Experiments are under way to further elucidate these points. For over a year now the writer has been adding lactic acid (dram  $\frac{1}{2}$  to a quart) to milk in the dietary of most of his gastro intestinal cases for reasons indicated above.

In the writer's series of cases in which *Acidophilus* cultures were used, both rectally and orally results varied. While taking the milk many patients apparently improved, but directly the milk was stopped the symptomatology returned. Fecal smears and cultures showed a gradual diminution in the *Acidophilus* bacilli.

from the third to the eighth day until practically none could be found after that time, attempts at implanting *B. acidophilus* per rectum were invariably unsuccessful.

There is no doubt but that local and systemic disturbances can be benefitted by a transformation of the flora from a heterogeneous one to one in which the dominating organism is a non-pathogenic one. A diversified flora undoubtedly contains many pathogenic organisms whose identity and properties are as yet undetermined. The question arises in our minds whether by transforming the flora from the cosmopolitan type to the simplified type, we are not robbing the body of biologic influences of great moment. Very few studies with the *B. Acidophilus* have been made which throw much light on colonic bio-chemistry. On the other hand a large literature is growing up which gives to the *Colon Bacillus* a greater and greater role in maintaining normal physiological balances in the body.

For two years the writer has been using *B. coli* implantations in the treatment of colitis and the results have been exceedingly gratifying. He has justified this therapy through the work of Koessler, who showed that when *B. coli* are allowed to metabolize the amino-acid histidin, the toxic amin, histamin, is not formed. He also showed that histamin is only formed in an acid media. Connellan, in unpublished experiments, has demonstrated that the high acidity of certain stools is due to formic acid which is a product of bacterial action on certain sugars. Praks, Jollyman, Karazog and Schiff<sup>23</sup> have shown that formic acid is decomposed by colon bacillus with sodium formate as result. This in turn yields sodium carbonate through bacterial activity, thus normalizing the hydrogen-ion content. Connellan maintains that the high acid of the cecum inhibits *B. coli* growth, thereby removing an important factor as an obstacle to histamin formation. Langdon Brown<sup>21</sup> has shown that the colon bacillus splits off indol from the amino-acid Tryptophan and that indol is an endocrine activator. Harries<sup>22</sup> has demonstrated the influence of indol variations in thyroid pathology.

The following bio-chemical technique has been followed in conjunction with the accessory methods outlined above in the treatment of colitis.

Colonic lavage with two quarts of a half of one per cent solution of monohydrated sodium carbonate is given daily. This alkali has the property of "autolysing" all Gram negative bacteria<sup>24</sup>. It also activates the d'Herelle. If oxalic acid is present, 2% of Calcium Lactate is added to the solution. Two ounces of kaolin is added to the carbonate and lactate mixture. The kaolin has the property of making the histamin inert as well as a simplifying effect on the intestinal

flora<sup>25</sup>. It also has a soothing effect upon inflamed mucous membrane. Barium sulphate has a like action, as is evidenced by the feeling of well being experienced by chronic intestinal invalids during an X-ray series, but on account of its tendency to form scybalæ it is not as beneficial. The patients either take a low enema at home or in the office, after which the above colonic medication is administered. Two quarts by volume at a temperature of 110° F is allowed to slowly enter the colon. It is important that the medication reach the cecum and that the intestine be carefully distended to break up small adhesions, to stretch large ones and to relax spastic segments. The increased splanchnic circulation induced by a hot colonic clyster stimulates the lymphatic circulation and the vagotonic and sympathetic systems.

It is very extraordinary how quickly an injected or oedematous mucosa will take on normal characteristics under the above treatment, as revealed by proctoscopic examination. Usually from six to ten colonic treatments are necessary before bacillary implantations are given. The writer's method of implantations is to mix a heavy suspension of colon bacilli of known biologic reactions (which have been grown on hormone agar and washed off with salt solution) with two quarts of a dextrin-kaolin mixture at 98.6° F and allowed to slowly enter the bowel. The dextrin enema produces a favorable cultural environment and the kaolin anchors the *B. coli* to the intestinal wall. A suspension of *B. coli* is also injected into the rectum by means of a large syringe and reversed peristalsis depended on to carry the culture upward. Colonic implantations are often preceded by abdominal diathermy to induce gastro-intestinal rest and better cultural conditions.

Where difficulty is experienced in retaining the preparation, 1/200 of a grain of hyoscine hydrobromide is given sub-lingually at the beginning of treatment. If the patient experiences much gas as the result of the treatment, gtts V of the oil of peppermint added to the suspension gives much relief.

The colitis therapeutics above detailed must be used with discrimination. Standardized methods often lead to the grave, literally for the patient and figuratively for the physician. Each patient must be individualized. More therapeutic mistakes are made by carelessness on the part of physicians than by ignorance, more curative failures are the result of impatience and disobedience on the part of the patient than wrong diagnosis or treatment on the part of the physician. Earnest co-operation between physician and patient is pre-requisite to success. Full realization is necessary on the part of the patient that a condition such as colitis which has perhaps

existed for years cannot be corrected in a fortnight. And the physician must realize that in no other condition does infinite care to the minutest detail in treatment reward both parties to the contract so well.

### CONCLUSIONS

1 Colitis is primarily due to frequent or continuous bacterial activation in the colon with resulting toxin formation, histamin in particular. Thus amin, on absorption, produces in the tissue an explosive edema with mucus formation.

2 The basic principle in the treatment of colitis should be the prevention of activating sugars from reaching the bowel.

3 Gastro intestinal immobilization, i.e., physiologic rest with a low residue diet or a residueless diet by mouth or by jejunal feeding, best produces a carbohydrate and peristaltic free colon.

4 Hydraulic dilatation, with temperature and pressure scientifically regulated is of value in counteracting colonic spasticities, local or general.

5 Diathermy has a definite place in the treatment of colitis (a) by relieving colic, (b) by producing splanchnic hyperæmia and (c) by stimulating cellular activity.

6 Colonic bacteriolytic therapy, produced chemically or by utilizing the d'Herelle principle, followed by implantation of *B. coli*, has a definite place in the cure of colitis.

## THE FUNCTION OF COUNTY MEDICAL SOCIETIES

In an article recently brought to our attention appearing in *Medical Economics* for October 1923, written by Dr. Frank D. Jennings, of Brooklyn, N. Y., it is suggested that organized medicine rests on the County Medical Society as a fundamental unit. That is the live, going, moving basis of the entire structure. State and national organizations are in a sense 'paper' organizations meeting through a house of delegates once a year and handling at such times matters of state and national scope.

Therefore it is important to analyze the functions of a county society to determine what its sphere is, and to consider ways and means of making it of greater influence and enhanced value to the public and to the membership.

Organized medicine came into being because of public demand that some agency be created to regulate the 'practice of physic' charlatans abounding even at that time, the latter part of the eighteenth and early part of the nineteenth centuries. By legislative enactment it was permitted that county and state medical societies could be organized and among other powers granted to these societies was that of licensure. Later, the right to issue licenses to practice was withdrawn and assumed by the State.

This left for the County Society, then, two fields for activity—public health and medical education. The former, if at all, was consummated through the medium of a public health committee and it cannot be too strongly emphasized that this phase of county society activity is capable of the greatest and broadest development.

County societies have functioned in the educational field through meeting at stated intervals weekly, semi-monthly or monthly, at which matters of scientific interest, generally the most recent advances in medicine, are discussed. As far as they go, they are admirable and helpful. Thus during a year of normal

active work on the part of the responsible officers programs are provided which give an opportunity for the members to keep abreast of everything new.

Though this is of much benefit there is still something lacking. The general practitioner is not always attracted by a program of superlative, technical interest, and not without reason. His problems and troubles arise in the every-day practice of medicine, and programs such as have been mentioned do not bring him the kind of service he needs most.

It may be said here that not only should the County Medical Society function in graduate medical education for the physician, but its duty is to function for the education of the public within the County that it serves, and it would be far better did the County Societies awaken to their privileges and duties in holding clinics, lectures and demonstrations under its own governmental body, rather than leaving such a function to a state department as we see the tendency exhibited nowadays.

And so the County Society instead of resting on its laurels of a quarterly or semi-annual meeting should bring to its gatherings the lay people of the County, and at such a meeting could well discuss questions of import relative to medical subjects of the day, and could there within its own halls exert great influence upon legislative matters through the lay people interested, and so overcome to a large extent the pernicious propaganda of the present day.

Such meetings have been instituted sporadically by certain County Societies, as in Kings County, and with great success whenever so started, and in some instances the demand has been made by the laity and by legislators that such types of meetings be continued, since it has been found that the people of the present day are inclined toward self-education in all matters and especially are desirous of obtaining information in health matters.

## WHAT IS CHIROPRACTIC?

In a recent advertisement there appeared the following

WHAT IS CHIROPRACTIC?  
(KI-RO-PRAK-TIK)

THE SCIENCE THAT DEALS DIRECTLY  
WITH THE CAUSE OF ILL HEALTH

Chiropractic is not a medicine, surgery, osteopathy, massage or faith cure, and is separate and distinct from all other health methods

It is a scientific method of locating and adjusting the cause of disease, without the use of drugs or instruments

No matter what your ailment is, do not think your case is hopeless. Take Chiropractic Spinal Adjustments. What they have done for others they can do for you. Do not, through ignorance of this wonderful science, shut the door to your ultimate relief and happiness.

Chiropractors do not treat, heal nor cure. They eliminate the CAUSE.

## CHIROPRACTIC

(KI-RO-PRAK-TIK) is a new science of adjusting the cause of disease, without drugs, based on a thorough knowledge of the nervous system. Nerves which control the various functions of the body emerge from small openings between the bony segments of the spinal column. A slight variation of these bones will cause pressure on a nerve and cut off the flow of mental impulses, lowering the vitality and the power of resistance of the tissues, the result of which is disease.

The Chiropractic method is to adjust the abnormality, remove the pressure by removing the cause, and thus permit the nerve to regain its normal size and function, restoring health. If you are ill and have tried everything else without results, why not try Chiropractic (spinal) adjustments and get well?

And, yes, what is Chiropractic?

J N V V

## DEFINITION OF CHIROPRACTIC

It is to be noted in chiropractic literature that there has begun to appear a cleavage from the original definition of chiropractic as proposed by its versatile writer and promoter of the present generation.

The original definition as it appears on page 11 of "The Science of Chiropractic," by B. J. Palmer, D. C., Ph. C., Davenport, 1906, is as follows:

"Chiropractic is a name given to the study and application of a universal philosophy of biology, theology, theosophy, health, disease, death, the science of the cause of disease and art of permitting the restoration of the true relationships between all attributes necessary to normal composite forms, to harmonious quantities and qualities by placing in juxtaposition the abnormal concrete positions of definite mechanical portions with each other, by hand, thus correcting all subluxations of the three hundred articulations of the human skeletal frame, more especially those of the spinal column, for the purpose of permitting the re-creation of all normal cyclic currents thru nerves that were formerly not permitted to be transmitted, thru impingement, but have not assumed their normal size and capacity for conduction as they emanate thru intervertebral foramina—the expressions of which were formerly excessive or partially lacking—named disease."

In the Ames bill offered to the Legislature of the State of New York in 1920, the practice of chiropractic was defined as follows:

"The practice of chiropractic is defined as follows:

"A person practices chiropractic within the meaning of this act who holds himself out as being able to locate and to adjust by hand misplaced or displaced vertebrae of the human spine for the purpose of relieving the nerve pressure caused thereby and who shall either offer or undertake to locate or adjust by hand misplaced or displaced vertebrae of the human spine for the purpose of relieving nerve pressure caused thereby."

In the Dunnigan bill offered to the Legislature of the State of New York in 1922, the practice of chiropractic was defined as follows:

"A person practices chiropractic within the meaning of this article who holds himself out as being able to adjust by hand the articulations of the human spine so as to relieve nerve pressure caused by subluxations thereof and who shall either offer or undertake to adjust by hand the articulations of the human spine so as to relieve nerve pressure caused by subluxations thereof."

In the Leminger bill offered to the Legislature of the State of New York in 1923, the practice of chiropractic was defined as follows:

"A person practices chiropractic within the meaning of this act, who holds himself out as being able to locate and adjust by hand misaligned or displaced vertebrae of the human spine, for the purpose of relieving nerve pressure caused thereby, and who shall offer or undertake to locate or adjust by hand, misaligned or displaced vertebrae of the human spine for the purpose of relieving nerve pressure caused thereby"

Apparently the science—if such it may be called, with its weak foundations and illogical reasoning, had to undergo modification to bring it down to earth and to square it with the solid thought of scientific reasoning of the present day, as is witnessed by a change in the definition, for B J Palmer in the January 6th number of the *Fountain Head News* has carefully restated his definition in such a way as to minimize the legal implications of the definition, and as part of his proposed universal state bill gives the following definition

"Chiropractic is defined to be the science of palpating and adjusting the articulations of the human spinal column by hand only. This definition is inclusive and any and all other methods are hereby declared not to be chiropractic."

Very interesting is it to note in the earlier writings of the cult the solemn declaration that their training and study was such as to make the finger tips more acute in palpating the spine and discovering therein the so-called lesions which account for all the ills of man, and to now note in the literature of this cult the many advertisements of the chiropractors who are abandoning this theory and depending to a larger extent on their "analysis" before giving treatment, upon the spinograph, which latter, when translated into present day terms, is our old friend—the X-ray

The very fact that the leader of this cult has allowed the science of X-ray to become incorporated in his so-called profession, thus disputing his original theories, in his commandments and protestations against the medical profession, now shows his desire to recognize this absolute method of diagnosis which so far exceeds his own as to compel him and his associates to incorporate this part of medicine in its broadest sense, within his own cult.

In this does the chiropractic cult begin to break down in its theories and to attempt to perfect itself slowly but what is inevitable in a squaring of thought of its logic (?) with the present scientific thought of the day

But there is another phase which is cropping up within the cult and receiving great attention

on the part of their editorial staff, namely, the development of the term and theoretical relation of "Innate Intelligence" to the practice of the same, and thus shows the desire on the part of the proponents and leaders of the cult to delve into the realms of mysticism and charlatanism, thereby allowing a back door exit for the ignorance and bravado shown in the front door expositions in the way of claims made for this pseudo scientific method of healing

In a recent article by one of the editors, there is contained this statement—"that man is something superior to a mere mass of material, actuated only by the physical and chemical laws of his being, is at once clearly understood, and is, of course, readily accepted by the thoroughbred chiropractor. We believe that, while these immutable laws are undeniably active in the structure, there is resident within a power which supervises every act and movement of the tissues

"This force is spoken of as Innate, because of being borne within the structure, and since each action is the perfect expression of forethought and ripened knowledge, the qualifying term Intelligence is aptly added to signify the true and perfect quality possessed by it."

Here we see one of the great factors which bring to such a group the blind acquiescence of the many who refuse to recognize these same immutable physical and chemical laws, which the science of medicine through its correlative branches is trying to solve toward prolonging of life and ameliorating of human ills

The introduction of this mystic "Innate Intelligence" smacks of a trial at riding a second horse akin to Christian Science.

But, be it said as a compliment to the true Christian Scientist of the present day, that his "Innate Intelligence" directs him now to a surgeon or one educated in the close study of the human frame and its mechanics, when that same true Christian Scientist suffers a fracture of a broken bone, and this came about only when the celebrated leader of that cult was brought face to face with the misfortune of a broken arm, so the report goes, and following her experience, modified at least one part of this so-called science to accord with other sciences of the present day

And so it will be for the cult which calls itself chiropractic. Gradually they will be compelled by the pressure of the sciences of the present day to narrow and belittle their own discordant thoughts and to broaden and accept the results of other real sciences until they shall have squared their doctrine of the healing art in accord with that which is taught to the student of healing of the present day under the term of medicine

## PSEUDOMIRACULOUS ABRAMS DIES

The old Roman proverb ran "*De mortuis nil nisi bonum*" Better is the variation, *De mortuis nil nisi verum*, for often the acts and deeds of the dead must be reviewed, to praise or to condemn, because of their continuing influence

When the influence of a false tenet, or of a mischievous doctrine, or of a spurious claim, or of a fraudulent system of medicine persists after the death of the misguided zealot, or the inspired idiot, or the plain knave who had been deceiving the people to their definite injury, it is eminently proper and desirable that the truth shall be told, plainly and emphatically

The people, who have not the opportunity to study and to decide the truth or falsity of published claims, are entitled to the explanation and warning of those who know

Thus it was most desirable that the falsity of the claim of possessing miraculous powers, made by Francis Schlatter should be combated, explained, and exploded, after his death

Concerning this man, who claimed to relieve people through the medium of handkerchiefs upon which he falsely asserted he secured, by supernatural means, the imprint of Christ's countenance, the most charitable thing one can say is that he was insane And indeed his irrationality during his preaching and his subsequent wandering off to die alone, in the Colorado cañons, strongly influences our acceptance of that diagnosis

Perhaps still worse than hoodwinking hungry souls that seek special revelation of divine power and divine help, is the systematized deception of the sick and suffering by means of magical claims, and the selling of impossible "cures," adjusted to the needs of victims through the use of a bogus, mysterious leased instrument

The absurd "oscilloclast" of Abrams, and the untrue statements regarding his "Electronic Reactions" still have their vogue, despite the fact

that Albert Abrams died on January 14, 1924, in San Francisco

As long as mystery and magic are preferred to genuine medicine, so long will the dollars flow from dupes to knaves And so it continues to be our duty to attack the theory and the false claims of Abrams and the unprincipled commercialists who follow his practices, even though he is dead

The newspapers tell us that one "Dr" Mary Lecoque, who held herself out to treat disease, in Arkansas, received a sample of blood from which she asserted she (like Abrams) could affirm or deny diseased conditions This individual is not listed as a physician in the American Medical Directory for 1923

She was charged with diagnosing the blood of a chicken as human blood, and offering to prescribe a cure for the supposititious sufferer In Jonesboro, Ark., she was accused of fraudulent misuse of the mails, in practising the method of Abrams, and he was to have been a witness for her at the trial, had he not been stricken with his fatal illness

For truth's sake it is quite regrettable that he was unable to appear, for undoubtedly he would have been discredited and the eyes of certain credulous ones would have opened

We must reiterate, to protect the people from fraud, that (1) no information can be elicited from the forehead which will assist in diagnosis, (2) there are no distinctive areas of dullness in the abdomen which determine the religion of an individual, (3) there are no specific vibration rates for drugs, nor are there vibration rates which can be communicated to a patient by the "oscilloclast" or any other instrument, which will result in a parallel therapeutic action, and lastly (4) Abrams persistently refused to submit to tests that could be scientifically controlled

A W F

## CO-OPERATION WITH LAY ORGANIZATIONS

The Brooklyn Tuberculosis Committee is an example of highly efficient and well-balanced volunteer health work With a Physician who is a member of the Medical Society of the County of Kings, the State Medical Society, and the American Medical Association, as its Executive Secretary, and with an active Sub-Committee of Physicians to guide it in all matters pertaining to the medical phases of its work, the Committee avoids the blunderings and mis-steps characteristic of organizations animated with volunteer zeal but without the wise guidance of professional medical advice

The Committee conducts a broad educational campaign for the prevention of tuberculosis in Brooklyn in close co-operation with the Depart-

ment of Health, the Department of Education, and the Medical Profession

There is a wide field for volunteer health agencies, for they can do many things that neither the health authorities nor the organized medical profession can do In a democracy their usefulness is manifold, to open up new lines of work, to demonstrate and experiment They should always keep in mind, however, that they are working in a technical field and that they should have the constant advice and guidance of the specialists in that field This policy the Brooklyn Tuberculosis Committee constantly follows Its good example is recommended to all volunteer health agencies

F O

## DIPHTHERIA-LIKE THROAT CONDITIONS

A case diagnosed by smears as Vincent's angina but which an autopsy showed it to be a carcinoma of the throat and upper esophagus, was mentioned in the February 11th issue of the *Health News*, the weekly publication of the State Department of Health, and in the State Department of Health Notes of the February 22nd issue of this JOURNAL. The impression given by the article was that the diagnosis of Vincent's angina was an error. It is more probable that the organisms of Vincent's angina, which seem to be present in most throats, become grafted on the carcinomatous ulcer, and that the case was both cancer and Vincent's angina. This case suggests a brief consideration of throat conditions in which membranes or ulcerations occur.

There are at least five rather common throat conditions in which membranes or ulcerations occur:

- 1 Diphtheria
- 2 Vincent's angina
- 3 Stomatitis
- 4 Streptococcus infections
- 5 Thrush

Diphtheria is by far the most common membranous condition of the throat, and its germs or diphtheria like bacilli are often present when the original condition is Vincent's angina. We have seen a case of severe Vincent's angina resulting in death after it had been treated for three weeks as diphtheria because the first culture was reported as positive for diphtheria. This patient was an adult with severe anemia, which is well known to be a predisposing condition favorable to the development of the organisms of Vincent's angina. The case was probably one of Vincent's angina, and the presence of diphtheria bacilli was only accidental.

Since the organisms of Vincent's angina are present in most mouths, they are likely to grow whenever the resistance of the tissues is lowered by disease or infection. It is natural to expect them to grow on a carcinomatous ulcer, but of course finding them on the ulcer does not exclude other conditions.

A mouth condition, called stomatitis, was formerly common and is now occasionally seen. This consists of small whitish ulcers on the gums and inner surfaces of the lips. They were often seen in the army when the soldiers could not attend to the hygiene of their mouths. The ulcers are caused by the organisms of Vincent's angina, or at least the organisms are found in the ulcers which quickly heal when a strong solution of copper sulphate is rubbed upon them several times a day. When the ulcers are in the back part of the throat, they may readily be confused with diphtheria. When a case of ulcerative stomatitis is seen, the treatment which is appropriate for Vincent's angina quickly clears up the mouth.

It is well known that an acute streptococcus infection may produce a transient membrane, but it is not so well known that streptococci of low virulence may produce a membrane which may persist for weeks or months. The bacilli grow on the surface of the tonsils and pharynx, and produce a friable, adherent membrane. When a membrane that is like diphtheria does not clear up in two or three days, there is a strong probability that the underlying condition is the result of an infection with either streptococci or the organisms of Vincent's angina.

A fifth kind of membrane which any physician is likely to see is that caused by organisms belonging to the thrush or *sprue* family. The common thrush organism is the *oidium*, but there seem to be several species which have not been clearly differentiated. Occasionally an adult is seen with a chronic infection of yeast like organisms which produce white flakes of membrane in the pharynx and on the cheeks. Such a case is difficult to diagnose and to differentiate from diphtheria, Vincent's angina, and chronic streptococcus infection.

A diagnostician that is expert is one who has clearly in mind a variety of unusual conditions which may account for a puzzling condition. The five throat conditions that have been enumerated do not exhaust the diagnostic possibilities of a membranous throat, but a physician who has them in mind will not go far astray in diagnosis.

F O

# LEGAL

## CHIROPRACTORS CLAIM RIGHT TO PRACTICE IN THE CITY HOSPITAL.

This headline appeared in a Jamestown Evening Journal of February 7, 1924, and as a subtitle to this interesting news item, appeared "Delegation of chiropractors and other persons interested in the movement appears before Board of Public Welfare and argues matter of admission to hospital to attend cases" It appeared from this article written under these headings that Mr Rice, a chiropractor of that city appearing at the head of the delegation in support of having chiropractors treat cases in the hospital, stated that he did not recognize the science of bacteriology and that he saw no logical reason why a chiropractor should not be allowed to treat patients in the hospital just as doctors do Dr J J Mahoney, superintendent of Public Health in that city asked Mr Rice some rather interesting and quite embarrassing questions The report states that he asked Mr Rice if he believes in the germ theory in the spread of contagious diseases and if he recognized the science of bacteriology, to which Mr Rice finally responded, "No, I do not" Dr Mahoney then stated, "Bacteriology is the cornerstone of all medical achievement It is a wonderful science, for it has saved thousands of lives, cut down epidemics and safeguarded public health And yet the chiropractors don't believe in it Any man who gets up before a Board like this or before any gathering of intelligent men and denies the existence of a science like bacteriology is analogous to a business man who denies the existence of the multiplication table" Speaking of the presence of the germs of tuberculosis in the body, Dr Mahoney said "Yes, the bug is generally there, but it does not get the same chance to do its damage that it used to get, thanks to the medical profession The number of tuberculosis cases in certain sections of the country has been cut in half within recent years because doctors have made a study of bacteriology and know how to combat this germ"

It was announced further in the article that the corporation counsel stated "That in view of the position Mr Rice admits that he has taken on the germ theory of disease, we would advise the Board to deny the chiropractors the right to work in the hospital" The matter was finally referred to the corporation counsel to determine if the Board could legally admit chiropractors to the hospital

A member of the hospital commission wrote to the counsel of your Society and asked some advice in this matter to which counsel responded

as follows "I cannot see how your corporation counsel can do otherwise than advise you that chiropractors do practice medicine and as they are not licensed they, therefore, violate the law, and your city hospital cannot legally permit chiropractors to violate the law in their city institution The courts have held that chiropractors practice medicine (*People v Ellis*, 162 App Div 288) It would be my opinion that the hospital would make itself liable to criminal prosecution, also its governing staff, were they to permit the hospital to be used by the chiropractors for the purpose of violating the Medical Practice Act"

It is further reported in the article that Mr Rice was asked if chiropractors attempted to treat contagious diseases and that Mr Rice replied that chiropractors do take contagious diseases

If a bill licensing chiropractors is passed by the Legislature, there will be no legal reason why chiropractors cannot be admitted to the hospitals to treat their cases, whether they be contagious cases or not Can the Legislature shut its eyes to the statistics that show an enormously reduced mortality in communicable diseases due to the advanced study and discoveries in bacteriology and license a cult to treat contagious diseases, the communicability of which has been determined by a study of bacteriology, when that cult denies the basic principles of bacteriology and substitutes for the known causes of communicable disease discovered through the study of bacteriology, an assumed dogma that all disease is based upon a subluxation of one or more vertebrae? The law must protect the public against ignorance, and cannot safely permit the practice of a cult that is based upon ignorance of the fundamental discoveries of bacteriology

Some time ago we conducted an extensive investigation of the principles, practice and teaching of chiropractic and broadcasted our results through the lay press for the public's education There are doubtless millions who are now better informed on this subject as a result of that work, so that it seems quite startling to hear such effort referred to as "unnecessary and fruitless investigation" Would that every physician within his circle among the laity would use the fruits of the investigation of chiropractic to combat the fundamental fallacy of that cult G W W

## THROMBO ANGIITIS OBLITERANS—GANGRENE—RESULTANT AMPUTATIONS AND DEATH

A man, about 62 years of age, had called upon a physician stating that he had for a long time been suffering from severe cramp-like pains of his left leg, extreme tired feeling after the least exertion and cold feet and that the big toe of the left foot was blue. The history did not disclose any diseases of childhood. General examination showed a poorly developed and undernourished condition, heart and lungs normal, except a few moist rales at the base of the left lung, muscles of the left leg were flabby and the circulation poor and no pulsation was felt at the dorsalis pedis and all of his toes were very cold. A diagnosis was made of thrombo-angitis obliterans. For his condition the application of heat to the leg was prescribed. On the following day he called at the physician's office and his leg was placed in a haker heated by nine incandescent lamps. At that time he was told that if he felt any burning sensation or if the baking became too hot to notify the nurse who stood at his side. The baking continued for fifteen minutes with all lamps lighted and for fifteen minutes longer with five lamps lighted. Upon the removal of the leg from the haker a small blister was observed on the outside of the calf of the leg, which blister was treated with boric acid ointment and the leg massaged. No other treatment was rendered by the physician to this patient.

The patient, however, was subsequently treated by other physicians for a gangrenous condition of the left leg necessitating the amputation of the leg to the knee. About a month after this amputation a further operation was performed for the removal of part of the leg between the knee and the thigh and about a month thereafter the amputation of the leg at the thigh as the gangrenous condition had progressed. Within three days after the third amputation the patient died.

After the first amputation the patient instituted an action charging the physician with having negligently burned his leg, causing an amputation of the same. This action abated with the death of the patient and an administrator's action was instituted against the physician to recover for the death of the patient, likewise charging the physician with negligently burning the patient's leg, resulting in a gangrenous condition with the subsequent amputations of the leg and death of the patient.

The plaintiff's attorney sought a settlement for a substantial sum. Later he reduced the amount of his demand and still later was willing to accept by way of settlement the funeral and other expenses, as the patient was unemployed and had no dependents. Refusal of settlement, even upon this basis, drove the plaintiff's attorney to the position where he requested a discontinuance of the action without costs against his client, which was consented to and the action terminated.

# LEGISLATION

By James N. Vander Veer, M.D.

## LEGISLATIVE BILLS

### SENATE

**In Re State Institute for the Study of Malignant Disease at Buffalo, N. Y.**—Senate Int No 175 (Print No S 175), by Senator Michael E. Reiburn of New York, concurrent Assembly Int No 195 (Print No 195), by Assemblyman Julius Berg of Bronx County, would amend section 345, Public Health Law, by placing fiscal control of State Institute for Study of Malignant Disease with State Department of Health. Referred to Public Health Committee in each house.

Still in committee. No action taken.

**The Narcotic Bill**—Senate Int No 285 (Print No S 289), by Senator Morton J. Kennedy of New York, concurrent Assembly Int No 342 (Print No A 342), by Assemblyman Morris Weinfeld of New York, is still in committee.

*Comment.* See report of a conference held in re the above bill of February 21st, under separate column headed "Conferences."

**In Re Appointing an Eye and Ear Specialist to Assist the Medical Inspector of Schools**—Senate Int No 317 (Print No 321), by Senator Benjamin Antin of New York, concurrent Assembly Int No 370 (Print No A 372), by Assemblyman Frederic S. Cole of Herkimer County. Was on order of third reading on February 25th, and was recommitted.

*Comment.* No further comment.

**In Re Distributing of Information Concerning Results of Scientific Study**—Senate Int No 436 (Print No S 445), by Senator Michael E. Reiburn of New York, concurrent Assembly Int No 588 (Print No 592), by Assemblyman Joseph Gavagan of New York, referred to Judiciary Committee in each house. Still in committee.

**The Child Experimentation Bill**—Senate Int No 548 (Print No S 608), by Senator John P. Ryan of Rensselaer County, no concurrent bill has as yet appeared in the Assembly. Still in Senate Committee on Codes.

*Comment.* It is hoped that the County chairmen have fulfilled their duty in writing to the members of the Senate Committee on Codes asking that the bill be kept in committee.

**The Anti-Vivisection Bill**—Senate Int No 588 (Print No 612), by Senator John P. Ryan of Rensselaer County, concurrent Assembly Int No 1094 (Print No 1180), by Assemblyman Samuel Mandelbaum of New York, referred to Codes Committee in each house.

*Comment.* It will be noted that the bill has made its appearance in the Assembly, where it has been referred to the Committee on Codes.

This is the same pernicious type of bill which would limit such valuable work as has been done in the past, making an entering wedge for final and complete anti-vivisection measures.

County Legislative Chairmen can rest assured that there will be unlimited numbers of letters addressed to the committees and to the Legislature, importuning them to vote the bill out of committee and on to the floor of the house, and even now the legislators have been besieged with mail from ill-advised welfare workers asking their affirmative votes for the bill.

It is therefore of the utmost duty for County Legislative Chairmen to write to each member of the Senate and Assembly Committees on Codes, as well as to your individual representatives in the legislative halls, asking them to be ready to object to the bills should they appear on the floor of the house.

**State Department of Education Bill to Amend the Medical Practice Act**—Senate Int No 637 (Print No S 663), by Senator Daniel J. Carroll of Kings County, concurrent Assembly Int No 888 (Print No A 927), by Assemblyman Frank H. Lattin of Orleans County, would amend sections 170, 171, 173 and 174 Public Health Law, relative to the practice of medicine. Every person now lawfully practicing and hereafter authorized to practice must register with the secretary of the board of medical examiners. Senate Bill referred to Committee on Public Health, and Assembly Bill referred to Ways and Means Committee.

*Comment.* The bill is still in committee, and no hearing has as yet been called upon the same.

**Workmen's Compensation Law, Relative to Occupational Diseases**—Senate Int No 700 (Print No S 740), by Senator Jeremiah F. Twomey of Kings County, concurrent Assem-

bly Int No 836 (Print No 862, 1112), by Assemblyman Frank Wilson of Albany County, would amend section 3, Workmen's Compensation Law, relative to occupational diseases Referred to Labor and Industries Committee in each house

This bill would add to the already long list of occupational diseases for which compensation is payable

The benzene derivatives and their homologues or analogues including aniline phenol, etc as well as poisonings by gasoline and the like derivatives, the skin involvements due to oils, cutting compounds and the like and silicosis or its sequelae"

Unless your Committee bears to the contrary the bill will be dropped after simply calling the attention of the profession to the same as we have done

In Re Practice of Chiropody and Podiatry—Senate Int No 738 (Print No S 781), by Senator William Byrne of Albany which has no concurrent Assembly bill as yet, is printed here in full for the information of the profession

STATE OF NEW YORK

No 781

Int. 738

IN SENATE,

February 15, 1924

Introduced by Mr. Byrne—read twice and ordered printed, and when printed to be committed to the Committee on Public Health.

AN ACT

To amend the public health law in relation to the practice of chiropody or podiatry

*The People of the State of New York represented in Senate and Assembly do enact as follows:*

Section 1 Article thirteen of chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health constituting chapter forty-five of the consolidated laws," is hereby amended by adding thereto two new sections, to follow section two hundred and eighty one a, to be sections two hundred and eighty one-b and two hundred and eighty-one-c, respectively to read as follows

§ 281-b Unlawful practice of chiropody Any person who shall advertise to practice chiropody, without being lawfully licensed and registered as a chiropodist or any business corporation which shall practice chiropody or advertise to practice chiropody, or any person who shall practice or advertise to practice chiropody under a certificate of trade name, shall be guilty of a misdemeanor and shall on conviction, for each and every offense be punished by a fine of not less than fifty dollars nor more than one hundred dollars or by imprisonment for a term not less than thirty days and not more than one year or by both fine and imprisonment.

This section shall not be construed to forbid or prevent the employment by any person, association or corporation of a duly licensed and registered chiropodist to treat employees or members thereof at the expense of said person, association or corporation

§ 281-c Chiropodist, revocation of license. Any licensed and registered chiropodist who shall use distribute, or display upon any card, sign or advertisement, the words, or any of them, "Foot Specialist," "Surgeon," "Orthopedic Specialist," or in any manner upon any card sign or advertisement hold himself out as being able to treat all diseases or all ailments or all conditions of the foot shall be subject to the revocation of his license and the annulment of his registration in the manner provided by section two hundred and eighty one for proceedings for the revocation of a license and the annulment of a registration

§ 2 This act shall take effect immediately

*Comment* Attention is called to the fact that this bill is a far different bill from Senate Bill Int No 229, which was printed in the JOURNAL of February 8th, page 130, which bill allowed physicians to practice as chiropodists without undergoing further examination and with which bill Senate Int No 229 as unamended there could be absolutely no objection but now under this new bill Senate Int No 738, the text specifically states that only that person can practice chiropody or hold himself out as competent to practice chiropody who has been lawfully licensed and registered as a chiropodist

Members of the medical society of this state —this bill deprives you as physicians from practicing a part of medicine in which you have been more thoroughly instructed than those in whose interest this bill has been introduced

Each member of the State Society should address a letter of protest against this bill to his individual representative in the senate and assembly *immediately*, as well as to the members of the committees on public health of both senate and assembly

The original bill as introduced by Senator William Byrne was printed in the Journal of February 8th, page 130 and comparison of the two bills should be made to note how cleverly the changes have been made which would deprive the physician of his right to practice this part of the profession in which he has been educated

This is a bill against which the profession should solidly align itself

The text of Assembly Int. No 507, concurrent Senate Int No 229 has been amended to read exactly the same as Senate Int No 738 and is under Assembly Print No 950, on

which a hearing will be held on Wednesday, February 27th

*Voice your objections thereon*

Senate Int No 830 (Print No 885), by Senator Walter Westall of Westchester County, concurrent Assembly Int No 1106 (Print No A 1192), by Assemblyman Herbert Shonk of Westchester County, is printed in full for the information of those physicians and laymen in Westchester County who might be interested therein

STATE OF NEW YORK

No 885

Int 830

Introduced by Mr Westall Read and referred to the Committee on Internal Affairs

AN ACT

*To abolish the office of Coroner of the County of Westchester and creating the office of County Medical Examiner and prescribing its duties*

The People of the State of New York, represented in Senate and Assembly, do enact as follows

Section 1 The office of Coroner in and for the County of Westchester is hereby abolished and the office of County Medical Examiner is created

Section 2 The District Attorney of the County of Westchester shall appoint a County Medical Examiner who shall be a duly qualified practitioner of medicine and surgery and who shall have had at least five years actual experience in the practice of his profession and who is a skilled pathologist and microscopist and who shall before entering upon the duties of his office take the constitutional oath of office The term of office of such Medical Examiner shall be at the pleasure of such District Attorney and such Medical Examiner shall receive an annual salary to be fixed by the Board of Supervisors of Westchester County, to be paid in the same manner as other county salaries are paid Such Medical Examiner shall receive in addition thereto all of his actual and necessary expenses incurred in the performance of his official duties, to be audited and paid in the same manner as other charges against said county The Board of Supervisors of the County of Westchester shall provide and furnish the necessary office or offices for such Medical Examiner

Section 3 The said Medical Examiner shall make examinations by view of the dead bodies of such persons only as are supposed to have come to their death in the County of Westchester, due to unlawful act or criminal neglect, and in such cases issue and file the proper death certificate. If upon such examination, the said Medical Examiner is of the opinion that death was due to unlawful act or criminal neglect, he shall at once notify the District Attorney and the police of the city, town or village within said County of

Westchester in which the body lay when found, and if on view thereof and inquiry into the cause and manner of death, he deems a further investigation necessary he shall upon being authorized by the District Attorney of the County of Westchester, make an autopsy and carefully reduce, or cause to be reduced to writing, every fact and circumstance tending to show the condition of the body and the cause and manner of death and for the purpose of such inquiry, the Medical Examiner shall have power to subpoena and examine witnesses under oath in the same manner as a magistrate would in holding a court at Special Session, which examination may be in private, in which case any or all persons other than those required to be present may be excluded from the place where such examination is held, and such Examiner may also direct witnesses to be kept separate so that they cannot converse with each other until they have been examined The District Attorney, or some person designated by him may attend and examine all witnesses

Section 4 It shall be the duty of any citizen who may become aware of the death of any such person to report such death forthwith to the office of the Medical Examiner, or to a police officer who shall forthwith notify the Medical Examiner Any person who shall wilfully neglect or refuse to report such death or who without written order from the Medical Examiner shall wilfully touch, remove or disturb the body of any such person, or wilfully touch, remove or disturb the clothing, or any article upon or near such body, shall be guilty of a misdemeanor

Section 5 If the said Medical Examiner finds that the person or persons causing such death by unlawful act or criminal neglect be not in custody, he must issue a warrant, signed by him with his name of office, in one or more counties, as may be necessary, for the arrest of the person charged, which warrant may be served in any county, and the officer serving it must proceed thereon, in all respects, as upon a warrant of arrest on an information, except, that when served in another county, it need not be endorsed by a magistrate of that county, and when such defendant is brought before said Medical Examiner, he may hold the defendant to answer or discharge him therefrom, in the same manner in all respects as upon a warrant of arrest on an information

Section 6 If the said Medical Examiner finds that a crime has been committed he may bind over as in criminal prosecutions, any witness as he deems necessary or as the District Attorney may designate to appear or testify at the court in which an indictment for such an offense may be found or presented Such Medical Examiner shall take charge of any money or other property found on the body of a person, the death of

whom causes investigation as provided in this act, and immediately deliver the same to the County Treasurer, who shall hold and dispose of the same as provided by law

Section 7 It shall be the duty of the Medical Examiner to keep on file in his office full and complete records of all deaths coming under his jurisdiction, together with his conclusions thereon. Such records shall be kept in the office, properly indexed, stating the name, if known, of every such person, the place where the body was found and the date of death. To the record of such case shall be attached the original report of the Medical Examiner and the detailed findings of the autopsy and inquiry, if any. The office shall promptly deliver to the District Attorney copies of all records relating to every death as to which there is in the judgment of the Medical Examiner, any indication of criminality, which said records so delivered to said District Attorney shall not be open to public inspection except with in the discretion of the District Attorney. All other records shall be open to public inspection. The District Attorney may require from such Medical Examiner such further records and information as he may deem necessary.

Section 8 The Medical Examiner may administer oaths and take affidavits, proofs and examine as to any matter within the jurisdiction of the office.

Section 9 This act shall take effect January 1, 1925

### IN ASSEMBLY

Medical Inspection in Schools Bill—Assembly Int. No 66 (Print No A. 66), by Assemblyman Joseph Reich of Kings County, is still in Assembly Public Education Committee. No concurrent bill has as yet appeared in the Senate.

In Re State Institute for the Study of Malignant Disease at Buffalo, N. Y.—Assembly Int. No 195 (Print No A. 195), by Assemblyman Julius Berg of Bronx County, concurrent Senate Int. No 175 (Print No S. 175), by Senator Michael E. Reburn of New York, still in committee.

In Re Nursing and First Aid Services in Factories, etc.—Assembly Int. No 309 (Print No A. 309), by Assemblyman Joseph Reich of Kings County, is still in Assembly Labor and Industries Committee, no action having been taken. No concurrent bill has as yet appeared in the Senate.

The Narcotic Bill—Assembly Int. No 342 (Print No A. 342), by Assemblyman Morris

Weinfeld, of New York, concurrent Senate Int. No 285, by Senator Morton J. Kennedy of New York County.

(See report of a conference held in re the above bill on February 21st under separate column headed "Conferences".)

In Re Appointing an Eye and Ear Specialist to Assist the Medical Inspector of Schools—Assembly Int. No 370 (Print No A. 372), by Assemblyman Frederic S. Cole of Herkimer County, concurrent Senate Int. No 317 (Print No S. 321), by Senator Benjamin Antin of New York County, the Assembly bill is still in Committee, the concurrent Senate bill is on order of third reading.

Comment: No further comment.

State Department of Education Bill to Amend the Medical Practice Act—Assembly Int. No 888 (Print No A. 927) by Assemblyman Frank H. Lattin of Orleans County, concurrent Senate Int. No 637 (Print No S. 663), by Senator Daniel J. Carroll of Kings County, still in Ways and Means Committee of Assembly.

(See concurrent Senate bill for comment.)

In Relation to the Sale of Wood Alcohol, Except as Metherol—Assembly Int. No 890 (Print No A. 929), by Assemblyman Frank H. Lattin of Orleans County, concurrent Senate Int. No 376 (Print No S. 380), by Senator Henry G. Schackno of New York.

In its present form the Medical Society is in favor of the bill and unless a change is made therein no further comment will be given.

Assembly Int. No 921 (Print No 965), by Assemblyman Edward Coughlin of Kings County, is printed here in full for the information of the profession. Referred to Assembly General Laws committee.

STATE OF NEW YORK

No 965

Int. 921

IN ASSEMBLY

February 13, 1924

Introduced by Mr. Coughlin—read once and referred to the Committee on General Laws.

AN ACT

To amend the general business law in relation to detailed bill of cost of funeral.

*The People of the State of New York represented in Senate and Assembly do enact as follows:*

Section 1 Chapter twenty five of the laws of nineteen hundred and nine, entitled "An act relating to general business, constituting chapter twenty of the consolidated laws," is hereby amended by inserting therein a new article to be article thirteen, to read as follows:

which a hearing will be held on Wednesday, February 27th

*Voice your objections thereon*

# AN ACT

*To abolish the office of Coroner of the County of Westchester and creating the office of County Medical Examiner and prescribing its duties*

The People of the State of New York, represented in Senate and Assembly, do enact as follows

Section 1 The office of Coroner in and for the County of Westchester is hereby abolished and the office of County Medical Examiner is created

Section 2 The District Attorney of the County of Westchester shall appoint a County Medical Examiner who shall be a duly qualified practitioner of medicine and surgery and who shall have had at least five years actual experience in the practice of his profession and who is a skilled pathologist and microscopist and who shall before entering upon the duties of his office take the constitutional oath of office The term of office of such Medical Examiner shall be at the pleasure of such District Attorney and such Medical Examiner shall receive an annual salary to be fixed by the Board of Supervisors of Westchester County, to be paid in the same manner as other county salaries are paid Such Medical Examiner shall receive in addition thereto all of his actual and necessary expenses incurred in the performance of his official duties, to be audited and paid in the same manner as other charges against said county The Board of Supervisors of the County of Westchester shall provide and furnish the necessary office or offices for such Medical Examiner

Section 3 The said Medical Examiner shall make examinations by view of the dead bodies of such persons only as are supposed to have come to their death in the County of Westchester, due to unlawful act or criminal neglect, and in such cases issue and file the proper death certificate If upon such examination, the said Medical Examiner is of the opinion that death was due to unlawful act or criminal neglect, he shall at once notify the District Attorney and the police of the city, town or village within said County of

Westchester in which the body lay when found, and if on view thereof and inquiry into the cause and manner of death, he deems a further investigation necessary he shall upon being authorized by the District Attorney of the County of Westchester, make an autopsy and carefully reduce, or cause to be reduced to writing, every fact and circumstance tending to show the condition of the body and the cause and manner of death and for the purpose of such inquiry, the Medical Examiner shall have power to subpoena and examine witnesses under oath in the same manner as a magistrate would in holding a court at Special Session, which examination may be in private, in which case any or all persons other than those required to be present may be excluded from the place where such examination is held, and such Examiner may also direct witnesses to be kept separate so that they cannot converse with each other until they have been examined The District Attorney, or some person designated by him may attend and examine all witnesses

Section 4 It shall be the duty of any citizen who may become aware of the death of any such person to report such death forthwith to the office of the Medical Examiner, or to a police officer who shall forthwith notify the Medical Examiner Any person who shall wilfully neglect or refuse to report such death or who without written order from the Medical Examiner shall wilfully touch, remove or disturb the body of any such person, or wilfully touch, remove or disturb the clothing, or any article upon or near such body, shall be guilty of a misdemeanor

Section 5 If the said Medical Examiner finds that the person or persons causing such death by unlawful act or criminal neglect be not in custody, he must issue a warrant, signed by him with his name of office, in one or more counties, as may be necessary, for the arrest of the person charged, which warrant may be served in any county, and the officer serving it must proceed thereon, in all respects, as upon a warrant of arrest on an information, except, that when served in another county, it need not be endorsed by a magistrate of that county, and when such defendant is brought before said Medical Examiner, he may hold the defendant to answer or discharge him therefrom, in the same manner in all respects as upon a warrant of arrest on an information

Section 6 If the said Medical Examiner finds that a crime has been committed he may bind over as in criminal prosecutions, any witness as he deems necessary or as the District Attorney may designate to appear or testify at the court in which an indictment for such an offense may be found or presented Such Medical Examiner shall take charge of any money or other property found on the body of a person, the death of

tary in office when this article takes effect shall continue in office until his successor has been appointed as above provided

Expenses [All fees, fines, penalties and other moneys derived from the operation of this article shall be paid into the state treasury and the legislature shall annually appropriate for the department an amount sufficient to pay all proper expenses incurred pursuant to this article. All funds in the custody of the state board of pharmacy when this act takes effect shall be immediately turned over to the department and shall be available for the payment of all proper expenses of the board, until an appropriation is made by the legislature as above provided. When such appropriation is so made the unexpended balance of the funds so turned over to the department shall be paid into the state treasury to be expended as in the case of other moneys derived from the operation of this article.] *Notwithstanding the provisions of any other general local or special law, all fees fines penalties and other moneys derived from the operation of this article shall be paid to the regents of the university and shall be available together with the appropriations made from time to time by the legislature for the payment of all proper expenses of the board, including the salaries of the secretary and his assistants, inspectors, chemists examiners and of any deputy attorney general assigned for the purpose of enforcing the provisions of this article, and other employees, and their necessary disbursements. The unexpended balance of all such fees, fines, penalties and other moneys derived from the operation of this article remaining on December thirty-first of each year shall be paid into the state treasury.*

§ 2 Section two hundred thirty three of such chapter, as last amended by chapter one hundred eighty-three of the laws of nineteen hundred and twenty two, is hereby amended to read as follows

§ 233 Licenses, certificates examinations, rules Satisfactory evidence verified by oath shall be required by the regents of all candidates for admission to the examinations

Pharmacist They shall admit to the examination for pharmacist any candidate that pays a fee of ten dollars and

1 Is more than twenty-one years of age.

2 Is of good moral character

3 Had prior to the beginning of the first year of pharmaceutical study the general education required by the rules of the regents preliminary to receiving the degree of graduate in pharmacy, which education after January first, nineteen hundred and twenty three, shall not be less than three years of academic work or its equivalent

4 Has studied pharmacology as outlined in the syllabus not less than two years in a school.

5 Has either received the diploma of gradu-

ate in pharmacy or equivalent degree from a school, or a license conferring the full right to practice pharmacology in some foreign country registered as meeting the minimum requirements of this article. The diploma of graduate in pharmacy or equivalent degree shall not be conferred on any one that did not file with the school at matriculation the pharmacy student certificate required above

6 Has had four years experience in a registered pharmacy or drug store, under the personal supervision of a pharmacist or druggist, one year of which experience within five years of the date of application must have been in a pharmacy or drug store of the United States. *Provided, however that a graduate of a registered school of pharmacy, who has not had four years' practical experience in a registered pharmacy or drug store or who is not twenty-one years of age, may be admitted to the examination in theoretical subjects only, and thereafter upon the submission of satisfactory evidence of the completion of four years actual experience in a registered pharmacy or drug store and that such applicant is over twenty-one years of age, he may be admitted to the examination in practical pharmacy upon payment of an additional examination fee of ten dollars and if the examination is successfully passed the board shall grant to such applicant a pharmacist license*

7 Is a citizen of the United States or has made due application to become such citizen. In the event that an applicant who is a citizen of a foreign country but who has declared his intention of becoming a citizen of the United States shall be examined and licensed in accordance with the provisions of this article and shall fail to complete his citizenship within the time prescribed by law the license so granted to such applicant may be revoked by action of the regents upon proof of such failure

[Junior pharmacist They shall admit to the examination for junior pharmacist any candidate that pays a fee of ten dollars and

1 Is more than nineteen years of age

2 Is of good moral character

3 Had prior to the beginning of the first year of pharmaceutical study the general education required by the rules of the regents preliminary to receiving the degree of graduate in pharmacy, which education after January first, nineteen hundred and twenty three shall not be less than three years of academic work or its equivalent

4 Has studied pharmacology as outlined in the syllabus not less than two years in a school

5 Has received the diploma of graduate in pharmacy from a school.

6 Has had two years experience in a registered pharmacy or drug store under the personal supervision of a pharmacist or druggist, all of

which experience must have been in a pharmacy or drug store in New York state ]

**Druggist** They shall admit to the examination for druggist any candidate that pays a fee of five dollars and

- 1 Is more than eighteen years of age
- 2 Is of good moral character
- 3 Has the preliminary and professional education required by the rules
- 4 Has had three years' experience in a registered pharmacy or drug store under the personal supervision of a pharmacist or druggist, one year of which experience within five years of the date of application must have been a pharmacy or drug store of the United States

**Examinations**—The board shall submit to the regents as required suitable questions for thorough examination in pharmacology, both written and practical, as outlined in the syllabus

From these questions the secretary shall prepare question papers in accordance with the rules which at any examination shall be the same for all candidates. Examinations for license shall be given in at least three convenient places in the state and at least four times annually in accordance with the rules. The practical examinations shall be conducted by the examiners, the written by the regents. On receiving from the board an official report that an applicant has successfully passed the examinations and is recommended for license, the regents shall issue to him a license to practice according to the qualifications of the applicant. Every license shall be issued by the regents under the seal and shall be signed by the commissioner, [each examiner] and by the secretary. Every certificate shall be issued by the board subject to rule and shall be signed by the secretary. Applicants examined and licensed by other state examining boards registered by the regents as maintaining standards not lower than those provided by this article may without further examination, on payment of twenty-five dollars to the regents and on submitting such evidence as they may require receive from them an endorsement of their licenses or diplomas conferring all rights and privileges of a regents' license after examination

Before any license or certificate is issued it shall be numbered and properly recorded, and its number shall be noted in the license or certificate. The regents on the recommendation of the board may revoke a license or annul a certificate, for cause

[The questions for examination for licensed pharmacist and junior licensed pharmacist shall be identical. An applicant for examination for junior licensed pharmacist shall be eligible to take the examination in theoretical subjects only. Such applicants may, subject to the rules of the board, upon completing four years' actual experience in

a pharmacy or drug store, provided such applicant is over twenty-one years of age, be admitted to the examination in practical pharmacy, and if successful, the board shall grant such applicant a pharmacist's license ]

**Rules**—The rules of the board and of the regents affecting examination, registration and administration continue in force until revised by the board and approved by the regents

The board shall make rules subject to the approval of the regents

- 1 For the certification and registration of apprentices and storekeepers
- 2 For the surrendering of licenses, issued prior to January first, nineteen hundred and one
- 3 For the acceptance of licenses from other licensing boards issued prior to January, nineteen hundred and five, in lieu of a diploma
- 4 For the accomplishment of the trusts reposed in them by this article and by any other law of the state

All licenses and certificates of examination, issued to licensees by former boards of pharmacy, shall be in full force and effect in perpetuity for the section of the state for which they were issued, and all certificates of registration issued during nineteen hundred and ten shall be valid until January first, nineteen hundred and eleven

§ 3 This act shall take effect immediately

#### AN ACT

To amend the railroad law, in relation to equipment of passenger cars

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Chapter four hundred and eighty-one of the laws of nineteen hundred and ten, entitled "An act in relation to railroads, constituting chapter forty-nine of the consolidated laws," is hereby amended by adding thereto a new section, to be section seventy-one-a, to read as follows

§ 71-a Emergency equipment of passenger cars It shall be the duty of every railroad corporation operating trains, whether on surface, elevated or under ground, to provide each passenger car regularly used upon its railroad, with a kit consisting of a box with a glass front, containing one quart of distilled water, one roll of

two inch bandage, one roll of one and one-half inch bandage, four ounces of medicated cotton, one four ounce bottle of aromatic spirits of ammonia, one four-ounce bottle of hydrogen of peroxide and one flash light. The kit shall be set in some place of easy accessibility to the public. Every corporation, person or persons, operating a railroad in violation of the provisions of this section shall be liable to a penalty of twenty-five dollars for each passenger car operated without such kit.

§ 2 This act shall take effect September first, nineteen hundred and twenty-four

AN ACT

To amend the highway law in relation to qualifications for an operators or chauffeurs license.

*The People of the State of New York represented in Senate and Assembly, do enact as follows*

Section 1 Subdivision one of section two hundred and eighty nine of chapter thirty of the laws of nineteen hundred and nine, entitled "An act relating to highways, constituting chapter twenty five of the consolidated laws," as last amended by chapter five hundred and eighty of the laws of nineteen hundred and twenty-one, is hereby amended to read as follows

1 License of operators or chauffeurs Application for license to operate motor vehicles, as an operator or chauffeur, may be made, by mail or otherwise, to the tax commission or its duly authorized agent upon blanks prepared under its authority in such form and with proof of the applicant's fitness as the tax commission shall in its discretion determine. *The commission shall prescribe standard physical and visual tests and no license shall be granted to any applicant not conforming thereto* The tax commission shall appoint examiners and cause examinations to be held at convenient points throughout the state as often as may be necessary. Such application, if for a chauffeur's license, shall be accompanied by a photograph of the applicant in such numbers and forms as the tax commission shall prescribe, said photograph to be taken within thirty days prior to the filing of said application and to be accompanied by the fee provided herein. An owner of a motor vehicle or a member of his immediate family shall be granted an operator's license, subject to this article. Before an operator's or chauffeur's license is granted, the applicant shall pass such examination as to his qualification and *present such satisfactory evidence as to his physical and visual ability* as the tax commission shall require. No operator's or chauffeur's license shall be issued to any person under eighteen years of age. To each person shall be assigned some distinguishing number or mark and the license issued shall be such form as the tax commission shall determine, it may contain special restrictions and limitations concerning the type of motorpower, horse-power, design and other features of the motor vehicles which the licensee may operate and *each license shall be limited to a particular kind or make of car*, it shall contain the distinguishing number or mark assigned to the licensee, his name place of residence and address, a brief description of the licensee for

the purpose of identification and the photograph of the licensee if a chauffeur *An operator or chauffeur desiring to drive or operate more than one kind or make of car shall obtain a separate license for each such kind or make* Such distinctive number or mark shall be of a distinctively different color each year and in any year shall be of the same color as that of the number plates issued for that year The tax commission shall furnish to every chauffeur so licensed a suitable metal badge with the distinguishing number or mark assigned to him thereon without extra charge therefor This badge shall thereafter be worn by such chauffeur affixed to his clothing in a conspicuous place, at all times while he is operating or driving a motor vehicle upon the public highway Said badge shall be valid only during the term of the license of the chauffeur to whom it is issued as aforesaid Every person licensed to operate motor vehicles as aforesaid shall indorse his usual signature on the margin of the license, in the space provided for the purpose, immediately upon receipt of said license, and such license shall not be valid until so indorsed Every application for a chauffeur's license filed under the provisions of this section shall be sworn to and shall be accompanied by a fee of five dollars, three dollars of which shall be for examination aforesaid and two dollars for license fee Every application for an operator's license shall be sworn to and be accompanied by a fee of two dollars A license granted hereunder at any time shall expire on the ensuing first day of July A license in force when this section, as hereby amended, takes effect shall be deemed a license hereunder Failure by an operator or chauffeur to exhibit his license to any magistrate, motor vehicle inspector, police officer, constable or other competent authority, shall be presumptive evidence that said person is not duly licensed under this article

§ 2 This act shall take effect immediately

AN ACT

To amend the public health law, in relation to the licensing of private institutions for the treatment of drug addicts

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health law, constituting chapter forty-five of the consolidated laws," is hereby amended by inserting therein a new article, to follow article eleven, to be article eleven-a, to read as follows

#### ARTICLE XI-A

##### PRIVATE INSTITUTIONS FOR TREATMENT OF DRUG ADDICTION

Section 245 Private institutions for treatment of drug addiction, licensing, revocation of license, review of proceedings

§ 245 Private institutions for treatment of drug addiction, licensing, revocation of license, review of proceedings No person, association or corporation shall establish or keep an institution for the care, custody or treatment for compensation or otherwise of any person for the habit of taking or using any narcotic drug, including cocaine, opium, morphine, codeine, diacetyl morphine (heroin), cannabis indica, cannabis nativa, or any compound, manufacture, salt, derivative or preparation of any of them, or any synthetic substitute therefor, unless such institution holds a license for such purpose issued by the commissioner Every application for such a license shall be upon blanks provided by the commissioner in such form as he may prescribe and shall be accompanied by a plan of the premises proposed to be occupied, the extent and location of grounds appurtenant thereto, and the number of patients proposed to be received therein, with such other information, and in such form, as the commissioner may require The commissioner shall not grant any such license without first having made an examination of the premises proposed to be licensed, and being satisfied that they are substantially as described, and are otherwise fit and

suitable for the purposes for which they are designed to be used, and that such license should be granted. The commissioner may, at any and all times, examine and ascertain how far a licensed institution is conducted in compliance with the license therefor, and after due notice to the institution and opportunity for it to be heard, the commissioner having made a record of the proceeding upon such hearing, may, if the interests of the inmates of the institution so demand, for just and reasonable cause then appearing and to be stated in its order, amend or revoke any such license by an order to take effect within such time after the service thereof upon the licensee as the commissioner shall determine. Any determination of the commissioner in respect to the revocation of a license shall be reviewable under certiorari proceedings by the supreme court or a justice therein instituted in the judicial district in which such institution is located. Violation of the provisions of this section shall constitute a misdemeanor, punishable on conviction by a fine of not less than one hundred dollars and not more than five hundred dollars or by imprisonment for not less than sixty days or more than one year or by both such fine and imprisonment.

§2 This act shall take effect January first nineteen hundred and twenty five, except that applications for licenses may be made to the commissioner and the commissioner may make all necessary examinations and grant such licenses in his discretion, at any time after this act becomes a law.

# State Department of Health

## TULAREMIA.

In the western part of the State there has recently occurred a disease among wild rabbits which may be tularemia. The United States Public Health Service reports the finding of cases in rabbits in California, Utah, Wyoming, Idaho, Colorado, Indiana, Ohio, Tennessee, North Carolina and Washington, D. C. In the human it is an extremely infectious disease which causes marked disability for several weeks.

## VILLAGES IMPROVE MILK SUPPLY

Recently the boards of health of Warsaw and Gouverneur passed ordinances prohibiting the sale within their respective limits of any milk or cream except that from tuberculin tested cows.

## INDIGENT SYPHILITICS TREATED IN STATE CLINICS

During the past five years a total of 6643 syphilitics have been treated in the various clinics supervised by the Division of Venereal Diseases of the State Department of Health. None of these individuals so far as could be determined was able to pay for treatment by a private physician. The number of injections of arsphenamine given was 31,260. In this way a great many individuals were rapidly rendered non-infectious, resulting in a far fewer number of new infections than would have occurred otherwise.

## TOXIN-ANTITOXIN IMMUNIZATION STILL GOES ON

District State Health Officers Sears and Munson report that in spite of the recent accidents which have occurred in Concord, Mass., following the administration of previously frozen toxin-antitoxin, this preventive work has proceeded without interruption in their respective districts. Parents seem to realize that the afore-mentioned accidents were not likely to be repeated and that the good effects of toxin-antitoxin immunization far outweigh the improbable ill effects.

## STERILE OBSTETRIC PACKETS

The Division of Maternity, Infancy and Child Hygiene, has recently devised a model obstetric package for the emergency use of physicians and midwives. It is hoped that local organizations of women will make and keep supplies of these packages for use in their communities. Instructions for making them will be forwarded upon application to the Division.

## TYPHOID VACCINE PREVENTS SECONDARY CASES

During 1923, the Division of Communicable Diseases directed special attention to the prevention of secondary cases in families in which a primary case of typhoid occurred. This was done by urging the attending physician to immunize the well members of the family.

As a result of this effort there were only 57 instances of multiple cases of typhoid fever in 1923 while during the previous year there were 100 such instances. This represents a decrease of 43 per cent.

## CURES FOR INCURABLES

Recently the Department received a letter from one purporting to be "the champion lightweight boxer of the Central Atlantic District," asking for a permit to treat certain diseases. This gentleman has given up boxing in order that he may devote his time to curing incurable diseases. According to his modest statement he can "cure consumption in two weeks and tuberculosis in four weeks, depending upon the condition of the patient." He admits that he can cure epileptic fits in eighteen days. Although he will be satisfied to receive permission to treat only tuberculosis and epilepsy he prefers to have cancer included as he has unbounded confidence in his ability to cure that disease also.

## ORTHOPEDIC CLINICS ON LONG ISLAND

On January 17th the State Department of Health held an orthopedic clinic at Mineola at which twelve patients were examined. Among these were seven who were brought from Locust Valley by the school authorities. These children were suffering from various types of mild scoliosis, due to habit and poor muscular development.

A similar clinic was held at Huntington on January 24th. At this clinic seventeen patients were examined, all but two of which followed poliomyelitis.

## NEOARSPHENAMINE AVAILABLE FOR THE TREATMENT OF INDIGENT SYPHILITICS

Attention is called to the fact that in remote rural districts where it is impossible to refer indigent patients to a clinic doctors may through the health officer, secure from the State Laboratory neoarsphenamine for the treatment of syphilitics who are unable to pay for such treatment.

# CORRESPONDENCE

The Council at a meeting held in Albany, April 20, 1922, moved, seconded and carried That the JOURNAL be not used to in any way suppress any expression of opinion, and that its correspondence columns be open for all proper communications, and that 'proper' communications will be deemed those which are not slanderous or libelous in their nature

February 29, 1924

Nathan B Van Etten, M D, *Editor*,  
NEW YORK STATE JOURNAL OF MEDICINE

DEAR DOCTOR VAN ETTEN

Replying to your invitation on page 206 in the last issue I want to voice my protest against "The Medical Practice Act," as published in this issue, as follows

(1) A registration and tax discriminates against physicians when other professions, as the ministerial and the legal, are exempt The fact that dentists are taxed does not make it logical that physicians must be taxed

(2) The tax will work a hardship on the average practitioner who is already overtaxed Many poor physicians, such poor physicians often the cream of our profession and doing the most good, can not afford this \$2 per year, as it is needed in their families The average physician is a much poorer man than is imagined by the public The country doctor may go through snowdrifts several miles into the country and charge for the call which takes half a day \$2, and it will take the rest of the day to collect it, if he ever gets it This \$2 earned at such sacrifice the regents must have, it seems, to protect him against the chiropractor

(3) In using the money of the physician to prosecute irregulars the burden is placed on the physician instead of on the State where it belongs and the doctor is put in a bad light The good physician should need protection least of all, and it would seem that if he uses his money to put the chiropractor out of business so that, as stated in an issue of your Journal, he may put \$200 more each year into his own pocket—the doctor in such a case is fighting for more money for himself rather than for the good of the public, on which latter high moral platform he has hitherto stood The chiropractors and other irregulars then become "martyrs" and the reaction upon the regular may be, nay, will be, disastrous, for our motives can be impugned Our only solid reason for existence is the good of the public, and it is our duty to educate such public upon whose shoulders must fall the burden of freeing themselves of quacks

(4) With Dr Stanton, in your last issue, I wonder why in these 27 years the State Educational Department has not installed a properly indexed catalogue of physicians, nor why such department does not make use of the admirable registry of the American Medical Association Instead of spending a large amount of money in duplication, it would seem wise to use this and correct it where found defective

(5) From what I read, those in favor of this measure from our Governor down do not justify the taxing and re-registration in principle but say that it is to be defended because only by it can results be obtained In other words "the end justifies the means," and we should "do evil that good may come" This principle has from the time of Saint Paul been found unjustifiable

(6) I am disappointed that our State President should declare himself in favor, instead of maintaining a judicial position which would seem more in harmony with his office

Sincerely yours,

WILLIAM W ROOT, M D,  
Tompkins County Medical Society  
Slaterville Springs, N Y.

March 1, 1924

Nathan B Van Etten, M D, *Editor*,  
NEW YORK STATE JOURNAL OF MEDICINE  
DEAR DOCTOR

If we are to have an effective registration law and emasculate all "quacks" and all "cults" not qualified M D's, why will not registration every five (5) years, or certainly not oftener than once in two (2) years—say every even year, from 1894 be often enough Certainly that would clean out all irregulars, be less expensive to enforce, and give sufficient time to search over the cities and towns of the State thoroughly between each registration, and be less annoyance to the legitimate and ethical practitioners If not enforced by the authorities it will not be any better than the law of 1880

Very sincerely,

ARTHUR M JACOBUS, *Ex-President*,  
Medical Society of the County of New York

February 27, 1924

Nathan B. Van Etten, M.D., *Editor*,  
NEW YORK STATE JOURNAL OF MEDICINE.

DEAR DOCTOR

I have been reading over the proposed amendments to the Medical Practice Act as published in your issue for February 22, 1924. It seems to me that there are not proper provisions made for that group of physicians who are not in practice, who are spending their time in scientific work, often in connection with schools and hospitals. Many of them are not licensed in New York State and some of them not licensed in any state, and they are therefore apparently not eligible for registration. One would think that they would not be involved since they are not actually practicing, yet the amendment reads (173 2. C.)

"2 Any person, who, not being then law fully licensed and so registered according to law, shall (c) use the title 'doctor or any abbreviation thereof in connection with his name shall be guilty of a misdemeanor, etc' "

Do you not think that some mention should be made of this group which is small but still important from a standpoint of medical education and research? Of course it is assumed that these individuals would not be prosecuted under the law and yet it appears to my, probably imperfect, understanding that they would be guilty of breaking the law if they used a title to which they have a legal right.

I would be interested in hearing the opinion of yourself or perhaps the Society's counsel on this point

Very truly yours,

RALPH G. STILLMAN,  
*Assistant Director*,  
Department of Pathology

February 26, 1924

Dr. Nathan B. Van Etten, *Editor*,  
NEW YORK STATE JOURNAL OF MEDICINE.

DEAR DR. VAN ETTEN

In the interest of accuracy, may I be permitted a brief comment on certain statements in the letter of Dr. E. MacD. Stanton, Chairman of the Legislative Committee of the Schenectady County Medical Society, published in the JOURNAL of February 22d.

Dr. Stanton states that "At the Albany County Society meeting held in January, it was stated that although the State Department of Education has had supervision of the licensing of physicians in New York State for a period of 27 years, the department has not yet installed a properly indexed catalogue showing the physicians it has licensed. The failure of this department to develop a workable card index is no reason for granting it more responsibility in the line of cataloging the physicians of this State."

As a matter of fact, the State Department of Education has been charged with the licensing of medical practitioners since 1891, a period of 33 years, before which such licensing rested upon the State Medical Society. Hardly a day passes without one or more inquiries concerning licensed practitioners coming to my office. I have always been able to obtain accurate information concerning the name and date of license of any practitioner licensed within the last 33 years, simply by telephoning to the Examinations Division of the Department of Education, which has a complete alphabetical list of all such practitioners. Physicians licensed by the State Medical Society before 1891 were required by law to register with the State Department of Education only when transferring from one county to another. The State Department of Education has, contrary to Dr. Stanton's statement, a workable card index which is complete for the practitioners it has licensed.

Yours very truly,

HAROLD RYPINS, M.D., *Secretary*,  
Board of Medical Examiners,  
The University of the State of New York

# THE DAILY PRESS

is from the daily newspapers are the editors are interested in the sent out by the New York State of Health and the United States Service Every week we receive articles quoting Dr Matthias Nicoll, Commissioner of Health, on various topics. We noticed that several newspapers a radio talk by Dr Paul B Brooks, Commissioner of Health, telling a doctor The Albany Knickerbocker headlines, "Pick Physicians Does Berries, State Deputy Comes Illustration to Warn Off Quacks, License, Beware of Boasters"

contains remarks by Dr Brooks on fulness, judgment, and good horse average country physician, and ends its on the characteristics of the care-physicians, who are opposed to the attitudes assumed by incompetents

topic of interest to members of the State Medical Society—that of the Practice of Medicine act—does not arousing much interest in the local throughout the State, and it may safely be said that the people generally are not concerned. We have run across only a few on the subject during the past year. It was from the Syracuse Herald of February 17th, bearing the heading, "Chiropractic Public Aid in Medical War Claim, Would Illegalize Them by Legislative Action." The article is a description of the meeting of the North Central District Chiropractic Society on February 16th, in Syracuse. The President of the Society was quoted as saying: "A wide campaign has been started by the medical practitioners of chiropractic to defeat the Legislature, for protection of the public (the italics are ours), that chiropractic be regulated and regulated by the State this year. Our intention to carry our case to the franchise, women's, and other organizations view of having them adopt resolutions opposing the proposed medical legislation."

The article asks the question "Why do the medical organizations ask that legislation be passed classing the chiropractor as illegal?" It asks the question by asking another "Can we aim or prove that it is harmful to the public if it has been demonstrated and proven

right in thousands of cases, many of which the other methods had failed on? We will let the people decide as to what the medical man's reason is for asking such legislation."

Articles in favor of the proposed Practice of Medicine act were carried by two New York papers—the *Tribune* of February 21st, and the *Times* of February 20th. The *Tribune* article quoted District Attorney Banton as saying that high bail is needed for persons charged with illegally practicing medicine, because in several instances the defendants forfeited their bails rather than stand trial. He was quoted in favor of the proposed bill, because in it the penalties were more definite and severe than the present Act.

The article in the *Times* was on the editorial page and quoted from the remarks of Commissioner of Health Nicoll before the New York County Medical Society. The editorial closes with these words: "Dr Nicoll is using the powers of his office to elevate medical practice in this State. He has the courage as well as knowledge, and he does not hesitate to apply accurate epithets to quacks of all kinds. They are squirming under his characterizations, some of them not being used to such plain speaking. His work is primarily in the interest of public health, but naturally and inevitably its indirect result is the protection of real doctors from an unfair competition which too many of them have been too dignified to resist and resent." These closing lines remind us of the catch words, "Too proud to fight," which we heard just before the beginning of the war. If the doctors are too proud, or dignified to fight now, they will inevitably be drawn into a future conflict when the quacks and illegal practitioners will be a hundred times more powerful than they are at present.

At least three Rochester papers carry lengthy accounts of the annual meeting of the Corporation of the Highland Hospital. The *Journal* heads its account "Long Life Benefits City as Highland Hospital Sets Gain at \$7,500,000 Each Lived Year More." These figures are ascribed to Dr John R Williams, Chief of the Medical Staff, as the annual value of the service of the people of Rochester if a year were added to the life of each inhabitant. The doctor then gives figures showing the number of cases treated in the hospital, and the costs of the treatment—all tending to show that the hospital pays but

financial returns on its budget. Figures like these show that public health pays in a business way as well as on humanitarian grounds

The *Batavia News*, February 11th, carries an account of a meeting of the advisory council of the Milbank Memorial Fund, and says "The Foundation is spending \$2,000,000 in health work in New York State to demonstrate a belief held by many public health and social workers that within the next half century at least twenty years can be added to the present average life span. It quotes Dr Haven Emerson as saying "We are looking forward, as we believe, to the elimination of tuberculosis. If this can be done, it is worth buying, worth spending money for." These newspaper accounts have the great value of educating the people regarding the ideals which physicians believe are attainable. The articles should also impress the people with their own individual responsibility for the attainment of the ideals. How to educate the people is, of course, the great problem in any public health work. The people will forsake a careful physician for a get well quick schemer, just as they will forsake a bank for a get-rich-quick oil promoter

The *Olean Times*, February 15th contains an item on a speech made by Dr L. D. Bristol, County Health Officer of Cattaraugus County, at the Rural Community Conferences held in connection with the Annual Farmers' Week at Cornell University

Dr Bristol has the only county health officer district in New York State. This district is financed partly by the Milbank Fund, and is an experiment to show the practicability of making the county the unit in all public health work.

Several up-State papers record the prevalence of measles. The *Syracuse Post Standard*, February 16th carries the heading "Measles Epidemic Proves More Serious in Total Deaths Than Scarlet Fever." It quotes from the Bulletin of the City Department of Health that during January there were 255 cases of scarlet fever and no deaths, and 272 cases of measles with four deaths. The article also quotes Health Commissioner Farmer as calling attention to the use of serum from recovered cases for the prevention of measles in exposed children

The *Rome Sentinel*, February 19th, discusses the report of the health officer which contains the usual array of statistics regarding a variety of subjects from plumbing to maternity clinics. The only interesting and instructive part of the report is that regarding an epidemic of measles, which now seems to be at an end. It says "During January there were 165 cases reported in 103 homes. At the present time there are but 25 houses where the measles sign is displayed. The disease has not been severe and but a few deaths have been reported." This report from Rome is misleading, for it gives the impression that measles is of little importance. Yet reading between the lines, the epidemic was of considerable importance if a few deaths occurred.

The *Ithaca Journal News* February 18th, contains an editorial on the subject, "A Nation of Hypochondriacs," in which the editor was appalled at the public interest in disease as shown by the great number of cures mentioned in the daily press, and in conversations. The article mentions the forty-five or more cults which were listed by the Health Department of New York City (see page 230 of the February 22 issue of this JOURNAL). The article continues "Practically every possible change has been rung on the word 'therapy', the sun, moon and stars have been called to aid the ailments of mankind, water, fire, electricity, and herbs do their bit, mud, air, color and light are enlisted in the drive against disease. It is to laugh—or weep. The millions of dollars to be had in the game constantly recruit the ranks of healers."

The attitude of the Ithaca paper is a fair sample of that of all the other papers of the State. We have not found one that upheld the quacks and cults, but practically all carry reputable news upholding the medical profession

Two papers, the *Times* of Middletown and the *Dispatch* of Utica, comment on the "Habit of taking cold," basing their comment on a publication of the U S Public Health Service. It states that 35 per cent of the Nation's population suffer continually from colds. The Ithaca paper states that the Public Health Service is studying the subject of colds, and continues "It is a relief and pleasure to read about so much common sense action after so much medical vaudeville about monkey glands." The article could have truthfully said that it is the sensational papers that exploit the alleged news about monkey glands and similar subjects

## ANOREXIA IN CHILDREN \*

By T WOOD CLARKE A B., M.D

UTICA, N Y

**A**NOREXIA is a symptom so commonly met in the practice of the pediatricist that it would take more than ordinary courage to read a paper on the subject before this section were it not that I have to present the report of one case which I believe to be both out of the ordinary and distinctly instructive.

In the nursing baby, provided it is fed with proper regularity and not overloaded with sugar and water or similar concoctions, anorexia is rarely seen except in icterus neonatorum, where it is of importance only in so far as the attendant worry interferes with the mother's lactation.

Loss of appetite in the bottle baby usually means over feeding with malt, a sugar preparation or a fat intolerance due to the high cream of top milk mixtures. A few days on a skimmed milk diet will usually improve the appetite and cause startling gains in weight. One case I saw a few years ago, the child of a physician and a follower of Dr. Winter, had gained one pound in its first five months of life on Winter's formulas, and it required a full hour to force three ounces of feeding down the baby's throat. On giving it plain skimmed milk it took seven ounces in ten minutes, gained twenty-eight ounces in four days (the baby had been badly dehydrated) and eight pounds in seven weeks. This is of course an exaggerated case, but equally gratifying, though less spectacular results are often obtained with the child that has lost its appetite on top milk or Jersey milk feeding by a few days on a skimmed milk diet.

Persistent anorexia in the older child is a more complex problem and may be due to faulty re-

gime, physical abnormalities, and constitutional diseases.

Among the commoner faults of regime is lack of fresh air and sunlight. If the child is kept in in the Winter, by Spring all food is distasteful.

Perhaps the most common cause is irregular and improper feeding. The all too common habit of allowing the child to select his own diet is an improper procedure. If this is done he develops the habit of deciding what he does not want, and the list becomes progressively longer. When he has once made up his mind that he cannot eat a certain article, the power of the childish imagination is such that the attempt to force it may produce actual nausea and gagging. I believe the child should be offered a well balanced ration and should be taught at the earliest age to clean up his plate. Where a well marked aversion appears it is my custom to make protein skin tests for the articles objected to before insisting on their administration. These being negative the child must be taught that he is to eat all food placed before him. If very small portions are started with and the quantity increased gradually, the dislike usually is replaced, first by tolerance and then by liking. In such cases it is of course necessary to refuse all desserts and sweets unless the substantial articles of diet have been eaten. The common practice in such cases of forbidding all sweets, I believe to be wrong. It takes away from the child the only attractive part of the meal, and makes him come to the table with an increased aversion to his food. I insist that attractive desserts be included in the menu. With these to look forward to the ordeal of swallowing less palatable food is greatly lightened, especially if the child clearly understands that the dessert will

\* Read at the Annual Meeting of the Medical Society of the State of New York at New York City May 27 1923

pass him by if his plate has not been cleared with promptness. I am also in the habit of instructing the parents to keep on hand a supply of simple candy, one, two or three pieces to be allowed after meals in proportion to the enthusiasm with which the meal has been eaten.

The offering of candy and sweets between meals, however, is not advisable. For the strong hearty child with a normal appetite a slight refreshment in the middle of the morning and afternoon adds to the pleasure of the day, increases the activity of the body and certainly does no harm. If, however, the child is inclined to refuse his meals, then the tid-bits between meals must be strictly interdicted. The common idea of mothers, and of some physicians, that the child that does not eat enough at meal time must be given a lunch to keep up his strength until his next regular meal is the foundation of much of the anorexia that occurs among children. Such a lunch is usually an undesirable form of diet, or inadequate in quantity, to do more than ruin his appetite for the next meal. My first rule in the treatment of the child who does not eat his meals is that he shall not be forced to eat it, but if he does not do so, he gets nothing until the next meal time.

Especially harmful to these children is the habit of giving a glass of milk between meals, as is done in so many schools. For the rugged, vigorous child who will eat anything in sight at meal time the school lunch is a help. For the more delicate, finicky child it is a detriment. But it is the finicky, the underweight child that is urged to drink it.

When in spite of a correct regime, the appetite is poor, a careful search must be made for physical abnormalities or constitutional diseases. The possibilities of tuberculosis, nephritis and especially of pyelitis must be excluded.

A careful inspection of the mouth and throat is of importance. Not only are bad teeth a prolific cause of loss of appetite but even more important are infected tonsils and adenoids.

Personally I believe that diseased tonsils are the most common of all causes of anorexia. This is a well recognized fact. We are all familiar with the increased appetite and gain in weight following tonsillectomy. One type, however, the association of which with diseased tonsils is not generally recognized is the case of the child with recurrent gastric attacks, with or without fever, especially of the type associated with acidosis and usually dubbed cyclic vomiting. There is frequently with the attack a transient enlargement of the cervical glands. These cases are in a great majority of instances a direct result of focal infection from diseased tonsils. I have been in the habit of calling them by the name of "tonsil infection." *Evidently, side Tales*

stomach," a crude name, if you will, but expressive. The complete cessation of the "biliousness," or the "cyclic vomiting" after tonsillectomy is gratifying to physician and parent alike. I can find no mention in text books of the tonsils as an etiological factor in cyclic vomiting. I believe it is the most common cause.

Abdominal causes of anorexia are the most obvious field for investigation in such cases. While the most obvious, it is probably the one region in which it is easiest to fall into error, as what appears to be a perfectly normal abdomen may conceal a serious physical abnormality or disease.

Such conditions as chronic intestinal indigestion, Hirschsprungs disease, or tuberculous peritonitis, with their abdominal distension and other characteristic symptoms are usually obvious. There is, however, in the child one abdominal condition which must always be kept in mind, which, though in the adult the simplest to diagnose of all abdominal diseases, offers at times great difficulty in the child, especially in the young child. I refer to appendicitis. We are all familiar with the difficulty of recognizing acute appendicitis in the young child, but I think we are less apt to appreciate that chronic appendicitis is more common than is generally believed, that its symptoms are often masked in the child, and that as a cause of anorexia it is easily overlooked. Where the more obvious sources of anorexia are not found, a thorough investigation of the gastro-intestinal condition should be undertaken. Intestinal parasites should be looked for, intestinal functions should be tested, preferably after an Adolph Schmidt test diet, and most important of all a complete series of gastro-intestinal X-ray pictures should be taken. Such investigations sometimes reveal to us unexpected causes of anorexia and point the way to a cure, otherwise impossible to attain.

Three years ago I had under observation a case of anorexia of so marked a degree, in which the results of careful investigation were so happy, that I feel it is worthy of a full report.

Patient F. L., aged 9 years, of Chaumont, N. Y., was admitted to St. Elizabeth Hospital, Utica, May 21, 1920, referred by the late Dr. Forsythe of Alexandria Bay.

*Family history*—Father and mother healthy examples of sturdy German-American farmers. There is no history of insanity.

*Past history*—Patient the youngest of three. She had always been well, strong, stout and not nervous. As her father expressed it, "She enjoyed all the happiness of the open country until

August 1918." At that time she had whooping cough from which she recovered and attended school during the winter. During the pertussis she vomited phlegm, but no food.

**Present illness.**—This dates from June 1919, eleven months before admission. At that time she was badly frightened when a tree near her was struck by lightning. Following this her appetite began to fail and she complained of becoming tired before the end of the day. From then on the history was of progressive loss of appetite and emaciation. Every few days the child decided on some new article of food which she could not eat. She was put under the care of several physicians in turn, but in spite of all efforts the child continued to emaciate and to refuse to eat. Three weeks before admission, she had decided that she could eat nothing but mince pie. At that time a new physician was consulted who ridiculed the idea and forbade the pie. She then said she could eat nothing and for the three weeks before admission she took but two to three mouthfuls of bread and two to three ounces of milk in the day. A marked psychic change had come over her. She became more and more depressed. For the past three months she was very quiet and lost all her cheerfulness. For the last three weeks she had not smiled once and took no interest in her surroundings. She has had no pain, no vomiting and no headaches. The bowels moved with fair regularity. She had grown so weak that she could not stand alone.

On examination the child presented a pitiful picture indeed. The degree of emaciation was extreme. Her skin was dry and rough. Her mental condition was that of advanced melancholia. She would not raise her head, and would not speak when spoken to. Most of the time she was sobbing quietly to herself. Her teeth were good, throat normal, heart and lungs normal, pulse 60, respiration 20, abdomen scaphoid, the anterior surface of the vertebrae being palpable over the entire length of the abdomen. There were no masses in the abdomen and no tenderness. There was a strong acetone odor. She weighed 49 pounds.

She was ordered milk or water every 2 hours. After 12 hours as she had refused to allow a mouthful to pass her lips, and the acetone was increasing, a stomach tube was resorted to and twelve ounces of milk introduced. While unable to swallow food, anything in the shape of medicine was taken readily and large doses of bicarbonate of soda and some stimulation were given in this way.

The ordinary laboratory examination gave no information of value, except for the presence of

acetone in the urine during the first three days. The blood count was: Red cells 4,000,000, Leucocytes 5,000, Haemoglobin 115 per cent, Neutrophils 47 per cent, small mononuclear 52 per cent, Basophils 1 per cent. The gastric analysis after an Ewald meal was as follows: Amount 60 cc., Free HCL 50, Total acidity 61, Lactic acid 0, Blood 0, Gram + cocci and small bacilli. The stool examination showed complete digestion of all elements. The Gram + and Gram - organisms were about equal in number. No gas found on fermentation test.

As the patient persistently refused to take any nourishment she was fed three times daily by means of the stomach tube, at each feeding twelve ounces of milk and one or two raw eggs being given. She protested slightly against the use of the tube but did not resist it in the least.

On May 24th, the third day after admission, she was given a barium buttermilk feeding through the stomach tube and a series of gastrointestinal X-rays begun, which revealed most surprising results, as follows:

Case F. L. X-ray No 90 May 24

Barium meal

Immediate pictures—shows stomach enlarged, well marked duodenal cap

4 hours—Stomach three-quarters full. Small intestine well filled

8 hours—Stomach half full, caecum filling

24 hours—Stomach and small intestine empty. Entire colon filled. Outline of appendix clearly seen

48 hours—Ascending colon, part of transverse colon and rectum filled, appendix plainly seen

72 hours—Caecum and appendix still filled. Rest of colon empty except for few traces in rectum

96 hours—Caecum half filled, appendix full, small trace in rectum

5 days—Small amount in caecum, appendix plainly visible and much enlarged. Rest of bowel empty

6 days—Still slight shadow of appendix. Rest of bowel empty

June 2—Colon injected. Dilated, sigmoid descending and transverse colon filled. Ascending colon distended with gas.

Forty eight hours later patient examined under fluoroscope. Two round shadows size of chestnuts seen in caecum. Rest of bowel empty. The proximal 15mm of the appendix shadow is size of a thread, next 12mm is dilated to width of 6mm. Following this is constriction 5mm in length. The distal 60mm is distended to an extent varying from 4 to 7mm. Following the

examination the colon was again injected and filled completely. The plate is taken after the second injection. This, however, caused no change in the appearance of the appendix.

From these findings it was evident that the patient had a distended, atonic stomach and a markedly dilated and diseased appendix. In view of the results reported a few years ago by the psychiatrists on the beneficial results obtained by appendectomy in certain cases of melancholia, it seemed to me probable that the abdominal condition was the causative factor of the child's psychosis and anorexia.

Dr I Harris Levy of Syracuse was called in consultation on June 9th. He agreed that the child's condition was probably due to the lesion of the stomach and appendix. He felt that her extreme depression did not warrant an immediate operation, and suggested the use of an Einhorn duodenal feeding tube. Dr Levy persuaded the child to swallow one mouthful of buttermilk for fluoroscopic examination of the œsophagus. In my further care of the case this was a great help, as I no longer allowed her to say that she could not swallow. Up to this time all nourishment had been administered by stomach tube. From then on she began taking very small amounts by the mouth.

On June 14th the duodenal tube was passed, oriented and left in place. The next day two feedings were administered into the duodenum. The patient gagged on the second feeding and then pulled the tube out saying if we would not put it back she would try to eat more. During the hours the tube was in place, the child was in a condition resembling collapse. The tube was kept in her room for its psychological effect.

From this time on the condition improved gradually. She became slightly less morbid, each day took more and more food by mouth and less and less had to be administered by the stomach tube. On June 21st her weight was 52 pounds, and she was allowed to put on her clothes. The next day she went out in the grounds. On June 27th her weight was 55 pounds and the stomach tube was used for the last time. During the next ten days she spent some time each day on the grounds and took several automobile rides. She was eating three fairly good meals a day, always under protest. From the date of admission, May 21st until July 7th, she never once asked for either nourishment or water. She took them by mouth towards the end when they were given to her simply because she knew that if she did not, they would be given by tube.

On July 6th, when she was gaining in strength and her weight was 56 pounds, she developed pain and tenderness in the right iliac fossa. The next day the abdomen was opened by Dr F M Miller and an enormous appendix was removed.

It was as hard as a dry rubber tube and the lumen large enough to hold a lead pencil. The pathological report follows.

**Pathological report** Specimen consists appendix 6 — 19cm. Serosal vessels are congested. Several small nodules made out along appendix which is covered with thin veil like adhesions, particularly in proximity end. On section lumen is patent and filled with fecal material. Some hypertrophy of submucosa and mucus coat in some places. On sectioning there is great distention of lumen with erosion of mucosa and submucosa. There is erosion of the glandular elements in places, œdema and congestion of submucosa, fibrosis and atrophy of muscularis.

**Diag** Chronic appendicitis.

Except for some pain in the side the convalescence was uneventful. The point of especial interest was that the night after the operation she cried for water and the next day begged for milk. From the beginning of convalescence she looked forward eagerly to each meal and ate what was given her with apparent relish. Her mental condition improved. She took more interest in her surroundings and at times smiled and even laughed. On July 24th she was discharged, weighing 58 pounds, and apparently in good general condition.

A year later I was informed that she weighed 83 pounds, was rosy and happy and had the normal hearty appetite of the out-of-door growing child. A letter from the father September 19, 1922, about two years after discharge, says "She appears to be in the best of health, and takes as active and enjoyable a part in all sports as any child of her age. She has just entered 7B grade in school and is progressing moderately well in that work."

In this case the child's anorexia and psychosis disappeared with the removal of her appendix. Just what the relationship was between appendix, anorexia and melancholia, it is impossible to say. While it is possible that the primary condition was a psychosis, unrelated to the chronic appendicitis and that the shock of anæsthetic and operation altered the psychosis and produced the cure, it would seem more probable that the focal infection in the appendix was the primary lesion and both psychosis and anorexia resulted therefrom. Certainly the cure followed immediately upon removal of the diseased appendix.

### Discussion

DR JOHN A CARD, Poughkeepsie. Dr Clarke's point regarding the feeding of milk and crackers in schools as a cause of anorexia cannot be too strongly emphasized.

How frequently do we have children brought to us with loss of appetite and find they are being fed during the mid-forenoon on crackers

and milk. If this is to be done let it be done early in the session of school rather than at 10.30 or 11 o'clock.

The end results of growth and nutrition in these cases do not in my opinion warrant the continuation of these practices.

DR. LEO WOLF, Niagara Falls. In discussing the part of Dr. Clarke's very interesting paper dealing with the subject of anorexia, I would like to state that this is a very important subject. In my opinion the greatest trouble lies in the fact that we have lost sight of the difference between children and colons and we are told by the various children's departments in Washington and elsewhere that milk is the ideal food.

In these cases of anorexia I think we have the best results with what has been called by some body a contrast diet, in the children who are overfed with animal foods and are, therefore, suffering from anorexia, I find that by reducing them, especially in bulk, to the safer minimum we will frequently have rapid results. Naturally, in the children seen at dispensaries in times of economic stringency, who are living on coffee and bread, we will see results on a properly balanced diet with plenty of milk and other animal foods.

DR. FRANK HOWARD RICHARDSON, Brooklyn. No one who has listened to the intensely interesting presentation of this case, can fail to appreciate that Dr. Clarke has made a wonderfully complete clinical study of the very obscure condition that confronted him. I seriously doubt whether many of us would have evinced both the patience and the skill necessary to unravel the mysterious set of symptoms, and find the cause.

With regard to the question raised as to the value of milk in child nutrition I think we ought to specify what we mean when we speak of milk. "Pigs are pigs," perhaps, but milk is not necessarily milk as anyone will agree whose work has carried him into some of the barns where our so-called Grade "A" and Grade "B" milk is produced. I do not believe anyone can overestimate the importance of fresh, clean, healthy and healthful, unprocessed milk, in the nutrition of children. To us here represented that means Certified Milk—not because Certified Milk is so wonderfully good, but because the only alternatives Grade "A" and Grade "B," are so poor. Whether one believes in pasteurization of clean fresh milk

or not is one thing, but it is quite a different thing to advocate pasteurization as a means of making unfit milk fit to drink. Pasteurization cannot make stale milk fresh, dirty milk clean, or unwholesome milk wholesome, and when it is remembered that pasteurization does not even effectually disinfect, and that calves fed on pasteurized milk have died from bovine tuberculosis, it would seem as if it were high time for those of us whose work deals primarily with the nutrition of children, to awake to the fact that poor milk is poor pabulum for the undernourished, whereas good milk (and I know of no good milk available to us here in the city but Certified) is almost an essential for growing children, if they are to reach their optimum. Anyone who has ever had any experience with the genus "hired man," knows that such an ideal culture medium as milk cannot safely be submitted to his unsupervised attention without becoming a very rich culture medium. Now whether this be an aquarium of live bacilli, or a hospital for dying bacilli (for as you know pasteurization is only required to kill off 120 thousand, leaving 30 thousand alive and lacking, of whatever variety they may happen to be), or a suspension of killed bacilli from boiling the milk—it is useless to expect such a vaccine as this to do much for the nutrition of the growing child. It has been an interesting experience to watch the conversion of physicians who have from time to time been appointed to membership on the Kings County Medical Milk Commission. Most of these men have been in the habit of buying Grade "B," a few very finicky souls have bought Grade "A," for their own table use. It is rather instructive to find that among our membership there is probably not a man or woman today who would buy anything but Certified Milk for his home, table. Why? Because in the course of their inspections of Certified farms in this and adjoining states, they have had occasion to see some of the farms from which ordinary commercial milk is obtained, and it does not take many such experiences to make one an ardent advocate of Certified Milk, and a very lukewarm advocate of commercial milk for children. (Of course, when I say that Certified Milk is the only safe milk available here, I include in that term Walker Gordon Milk, for as you know, this milk is produced under the same standards as is Certified Milk, and so is just as good as Certified Milk itself but no better.)

## WHY ALIENISTS DIFFER IN CRIMINAL TRIALS\*

By JOHN F W MEAGHER, M D, F A C P

BROOKLYN, N Y

**A**LIENISTS have the same prerogative to differ in their judgment of individual cases, as have lawyers, judges, engineers, etc. In fact, the same holds true with men in other branches of medicine,—gynecology, surgery, etc. Needless to say, it is in the so-called borderline cases of insanity where the greatest disparity of opinion is found. The outstanding feature in many of these criminal cases is the positiveness with which the divergent opinions are expressed. One of the opinions is often shown on the cross-examination to have been advanced on insufficient grounds.

An opinion may be given after personal examinations of the accused, or in answer to a hypothetical question. The former method is preferable, if sufficient time is allowed to properly study the whole situation. No man can have confidence in his opinion, and still less be able to convince others, if he has not had time to thoroughly study the situation.

The object of this inquiry is not to find out why there should be any controversy as to the sanity or insanity of a particular criminal. Rather it is to find out why alienists for the defense so often express diametrically opposite opinions to the alienists for the State—both sides being unable to come to any sort of an agreement. It is evident that when both sides give positive conflicting opinions, one opinion must be in error. I will defer till later, a brief discussion of the different attitudes of Law and Medicine regarding insanity as excusing for crime.

I might state here that faulty judgment may be due to one or more of the following factors:

1—A lack of clear ideas due to a superficial or too brief an examination,—where insufficient or even erroneous data has been collected.

2—A failure to properly weigh and compare the data collected, and thus not to get at the fundamental facts.

3—Accepting or appropriating the judgment of others, because of suggestibility or because of some other reason.

4—Permitting one's feelings (attitude) to bias one's judgment.

Attitude in a controversy is the assumption of a certain position because of one's feelings (conscious or unconscious).

The following factors are the most important ones which might influence an alienist in his opinion of the mental status of a criminal:

1 The standards of estimating insanity

2 The personality of the criminal

3 The family

4 The lawyers

5 Social considerations

6 The traits and trends of the individual investigator

There may be other factors of less importance but a consideration of the above will give one the chief reasons why alienists may travel toward quite opposite goals in estimating an individual case.

*Standards of Estimating Insanity*—For a number of years, I have given this whole subject considerable thought and study. Some psychiatric writers say that Law has no standard by which to gauge insanity in these criminal cases. They also say that Law has a different standard for purposes of commitment to an asylum for treatment, and for cases where testamentary capacity is the issue, and for criminal cases where insanity is pleaded as a defense. But is this not a logical differentiation? For though an individual with a depression might need medical treatment, one could hardly claim that the mere presence of a depression alone should render that individual incapable of making a valid will, nor should it necessarily render him, of itself, irresponsible for any criminal act he might choose to commit. And it is natural that the tests to be applied to show the need for medical treatment, should be milder and easier to apply, than those used to determine responsibility for a criminal act. As Meyer says, even among the insane there is rarely absolute irresponsibility. It must be remembered that a culprit is punished not for his feelings or desires, but rather because of his evil choice, where he knows that the act he is doing is morally and legally wrong.

The legal criteria in estimating insanity in criminal cases are whether the individual had the capacity and ability to know and to reason. It is not an inquiry to find out whether the individual was restless, or whether he had variable moods, or whether he showed the presence of this or that symptom. Some psychiatrists evidently regard almost any deviation from the normal as insanity in criminal actions. Yet Law holds that even a delusion to excuse must be the direct cause of the crime, and must be such that if it were true, it would justify the act, that it must not be only a wrong idea or impression.

Personally, I feel that the legal attitude is more practical—the medical viewpoint of gauging the responsibility of criminals being much too vague, where insanity is alleged. The ultimate issue is one of responsibility, and not one of insanity alone.

\*Read at the Annual Meeting of the Medical Society of the State of New York, in New York City, May 23, 1923.

Were one to regard every criminal as being mentally irresponsible, because psychiatrically he could be made to fit somehow into anyone of the lesser disorders mentioned in the official classification of the American Medico Psychological Association, then we would be in a bad way socially. For there we find not only psychopathic states (six of them, including criminalism and sexual psychopathy) but Hysteria and even Neurasthenia. Surely these should not in themselves be an excuse for murder. True manics, of course, are excusable. In them the excitement persists even after the act is committed. But the excitement subsides after the act, where the latter was motivated by emotional stress such as anger or hatred. So that if every case of restlessness were regarded as a hypomanic state, many criminals could successfully plead this and escape responsibility for their crimes. Many of these pleas of insanity are merely subterfuges.

It is not my intention to go into the question of partial responsibility, which is a matter that should be legislated into our laws. But the Court is not the place where this can be brought about.

Where a man appears in court as an alienist, yet in his own way of thinking entirely ignores the legal attitude regarding insanity, I feel that he owes it not only to himself, but to his profession, to openly state his position. If he does this, he can be more consistent later on in his cross-examination. He then admits that he appears as a psychiatrist (and sociologist) rather than as an alienist. In criminal procedures, one must remember that Law is not interested in psychopathology *per se*, but only in the question of an individual's legal responsibility for a crime. The Law does not ask whether the culprit is a perfect man. It is right here where we have one of the chief causes for alienists differing in their opinions as to a criminal's mental status.

No one presupposes that criminals show nothing but perfect character traits. Not when one considers that even normal men and women can have a number of traits and trends which might be regarded as psychopathic (e. g., sensitiveness, undue seriousness, feeling of inferiority, impulsiveness, etc.). But neither such traits, nor a psychopathic inferiority constitute insanity within the meaning of the law. Authorities vary greatly in estimating the number of psychopaths among criminals—varying from 10 per cent to 100 per cent. But these individuals cannot be re-educated in Court. And they are often dangerous to live in society. And as Healy says, and as we all know, civil insane asylums do not want them as residents. Attempts to regenerate criminal psychopaths is usually a fruitless task.

**The Criminal**—In considering other circumstances which might cause an alienist to err in his judgment, we have to look at the character of the criminal himself. In examining an alleged

insane criminal, his frankness and apparent truthfulness, or their absence, must be noted. In most of these cases when the alienist is asked to give his opinion on the individual's mental status, there is usually no doubt as to his guilt of the crime charged. In many instances, the plea of insanity is not advanced until just before or at the time of the trial. Many of these individuals are clever and alert, and continually on the defensive. The examiner should probe the story given him by the accused very carefully, particularly if the criminal is evasive, sullen, and defiant, or if his memory appears to be purposely bad. A thinly veiled attempt to lay a basis for a paranoid trend should not be allowed to stand where a little probing would show merely selfishness, immorality, and hatred as logical motives for the crime.

Exaggerations on the part of the criminal are not rare. Deliberate falsehoods—(contradictions of his own previous testimony or of that of other witnesses)—make one naturally suspicious of the whole story. To accept it in toto under the circumstances would be hazardous. But even alienists may be suggestible.

The alienist must neither be credulous nor incredulous, but should assume a straightforward scientific attitude in his study. In a criminal action where I testified that a man did not have a paranoid condition I was asked whether my opinion would be the same, if certain factors which the man denied, could be proved to be true by reliable evidence. My answer was that if he furnished me with a false or an erroneous history, my opinion would be invalid and would be withdrawn. This is the only position one could take in such instances.

Merely because an individual says that he did not know a certain criminal act was wrong, does not mean that this is the whole truth. The statement that the criminal had an irresistible impulse to commit murder is often a subterfuge. Genuine, obsessive acts are usually defensive, not aggressive ones.

**The Family**—In a case recently before us, our opinion that a man who had murdered his mother-in-law was suffering from the paranoid form of Dementia Praecox, was the cause of his being sent to the Matteawan State Hospital for the Criminal Insane,—probably for life. Later, his wife wrote one of us that she was anxious to get her husband out of the asylum, inferring that he was needed home. Before trial, relatives often recite in great detail all sorts of things to prove the insanity of the accused. Later they will reverse themselves or minimize the importance of their original story, in order to get their relative back home. As far as relatives are concerned this wish is only a natural one. The alienist must remember that this sort of proc-

ture is not rare,—where the man is first too insane to be tried for murder, and later, not insane enough to be kept in an asylum. The alienist to prevent being misled, must submit the story given him to a critical analysis. Thorough probing will save the alienist from having to admit on cross-examination that his study was superficial, and so his opinion not very convincing. This is especially true if his opinion in great part was based on a faulty history furnished by the relatives. Testimony of openly biased witnesses permits of all sorts of erroneous possibilities.

The attitude and behavior of relatives will often give an alienist a clue as to their sincerity—or lack of it. The refusal of relatives to testify before a commission in a case of alleged insanity would always arouse suspicion as to the validity of their claim, even though their lawyer advised this.

*The Lawyer*—A clever persuasive lawyer—and most of the successful ones are persuasive—endeavors to interest a well known alienist in his client. The history obtained from this source must also be scrutinized carefully where the indications are that there is apt to be a controversy. The lawyer, because of his training, is apt to include only those facts which will be of value to his side of the case. This is true not only in a historical approach, but in his framing of a hypothetical question.

In a certain individual twice charged with a serious crime, I told his lawyer that while mental conflict rather than criminal propensities might have motivated his crime, still I felt that under any circumstances, he was dangerous to be at large, and if called upon, I would so testify. To me, the important thing was that he was a danger to society. Whether he belonged in a prison or an asylum was of secondary importance.

In the case of a youth who had murdered his sister after a quarrel—she being single and eight months pregnant—we probed deeply into his past history, which was a bad criminal one. His lawyer, who was present at our examination of the culprit, saw the way the wind was blowing, and decided to drop the plea of insanity and dispense with alienists. In our opinion, he was not insane. At the trial, the plea was not one of insanity, but that his sister was killed by the accidental discharge of the pistol during a struggle. This was not true according to statements of relatives to us, who later reversed themselves. Yet this dangerous man was acquitted.

*Social Factor*—There is always wider interest in criminals from the affluent and socially prominent classes. This is particularly true if the criminal is also a woman. There is a popular idea that a rich criminal can engage all the lawyers, as to, and all the alienists he needs. In fact, not only a popular idea, but judges

even have expressed this in writing. It is in many of these cases—often at best doubtful borderline cases—where the alienist must study his problems deeply in order to exhaust all possibilities—a scientific requirement in any case. It is in these so-called prominent cases where one must guard against the element of suggestibility from whatever source.

*The Alienist*.—Inasmuch as it is the alienist who gathers and compares the data concerning a culprit's mental status, certain factors relating to the alienists themselves may be the determining cause of divergent opinions. A difference in judgment cannot be explained solely on a difference in intelligence or experience. Differences in planning one's work, in effort expended, in traits and trends, and particularly a difference in attitude, are basic factors in final judgments. It is not all a question of mental capacity. All alienists do not study every case with the same thoroughness, nor with the same amount of interest. This is true also in ordinary clinical cases.

The psychological investigations of Münsterberg, experimenting with university students and professional men, showed great variations in attention, perception, and memory in these normal men; many of whom gave erroneous answers, the result of suggestible questions. The possibility of honest error is naturally greater in biased witnesses in criminal cases, than in disinterested witnesses.

Some men are rather sensitive at being subjected to cross-examination. They may hesitate about admitting anything that might throw doubt on their original opinions. It should not hurt a man's pride to modify his original opinion, if valuable new evidence has been subsequently introduced, of which he was originally unaware. One should not unnecessarily fence with the cross-examiner, who, however, is not always after the facts. Usually he wants to confuse the witness, or to belittle his testimony. Of course, the alienist should have no interest in the outcome of the case, but only in upholding his own medical opinion.

While the alienist only has to show the fact of insanity, not the form, where he expresses a positive opinion of insanity regarding a criminal, and follows this by a persistent refusal to even attempt diagnosing the form of insanity—this is sometimes regarded suspiciously as showing bias. This is especially true if the evidence indicated an incurable form of insanity.

*Effort in Investigation*—A scientific approach to a criminal's mental state demands the elimination of all alternative probabilities in order to narrow the field to the most certain probability. One errs in accepting as an established fact any possibility. This is especially true when we

remember that erroneous perception, memory, and narration (the basis of testimony), is possible in anyone, particularly where the element of suggestion is strong. A father is not always logical in discussing the frailties of his unfortunate son.

Where interest in a case is deep, a man is more apt to devote greater effort and to more carefully plan his work. It is a mistake to oversimplify these problems. Psychiatric diagnosis is not merely a question of skill. One should arrange his data chronologically, and then subject it to careful scrutiny. A faulty diagnosis only ludes the real mechanism concerned in the crime and clouds the real mental status of the criminal.

An alienist should never permit his feelings to bias his judgment. Bias tends to magnify certain factors, and to minimize others. One must guard against being influenced by the opinion of others (unconscious suggestion). When an alienist expresses an opinion, it must be his opinion and not a reflection of the opinion of someone else. And if it be true that most of these cases in controversy are borderline cases, then one can easily see how a biased attitude might be a greater determining factor in arriving at an opinion than anything else.

**Hypothetical Question.**—Most of the preceding remarks refer to cases where opinions have been based on personal examinations of the accused. It is self-evident why alienists differ when it comes to giving an opinion in answer to a hypothetical question. Then they are answering entirely different questions—each lawyer drawing up his question to include material favorable to his own side of the case. If opposing alienists were only permitted to answer the same question, then they would be basing their judgments on common ground. In many of these cases, the real facts are brought out on the cross-examination.

## SUMMARY

Alienists often differ in certain instances because of the fact that many of these cases being borderline ones, they may permit of different interpretations. Perfect sanity and absolute insanity are two hypothetical extremes. There are all sorts of gradations between the two.

In other less difficult cases, alienists differ, chiefly because of one or more of the following factors:

1 One adheres to the legal idea of insanity (i. e., irresponsibility because of mental disease), and the other disregards the legal viewpoint and adopts the medical attitude, that most any defect in feeling, intellect or conduct, constitutes insanity (i. e., unsoundness of mind). These are really two different propositions (irresponsibility for crime vs. mental unsoundness).

Law maintains that the term "mental disease" is a rather vague one, varying from slight malaise to wild disorder. Medicine considers every abnormality. But in accepting insanity as an excuse for crime, law is interested only in the individual's capacity to know and to reason, i. e., his having understanding. Thus we see that in law, not every mental abnormality constitutes legal insanity in criminal procedure. Certainly law does not regard every neurotic, hysteric, or psychopath as insane and irresponsible, and rightly so. In fact, one must admit that it is just for these types that we need criminal laws and not only for normal people who but rarely commit capital crimes.

2 Different attitudes aroused by feelings of sympathy, suggestibility or any other cause. An alienist may be influenced by outside factors other than the scientific study of the criminal himself.

3 A failure to get at the real facts because of a superficial study or an illogical conclusion because insufficient data has been collected.

## THE PROBLEM OF THE STUTTERER.\*

By JAMES SONNETT GREENE, M.D.

NEW YORK CITY

THE problem of the stutterer is best exemplified by a letter which I recently received from a man in Chicago. He discusses rather extensively on the various forms of treatment which he has taken for the cure of his stuttering speech. I shall briefly mention what he has tried, although his problem is still unsolved. He says:

"I am now forty years old and my trouble seemed to commence when I first started to school. For the first few years I could read and

recite with some difficulty, which increased until at about my ninth year I was unable to say anything at all in the school room. Outside the school room I could talk a little better, but for the most part made little effort to talk. When I started to work at about 15 years of age my stammering grew far worse and I could say practically nothing. But at home alone in my room I could not stammer if I tried to. And I am still the same way. I can talk with perfect ease when I know that I am absolutely alone.

My first experience in seeking a cure was in my nineteenth year. I saw an advertisement by

(Read at the annual meeting of the Medical Society of the State of New York in New York City, May 23rd, 1923.)

a phrenologist who cured stammering I was told to forget stammering and develop self-esteem, etc (No help)

"I then tried a man who advocated New Thought Was told to suggest to myself that I was going to talk perfectly It didn't work

"The next year I joined a teacher's 'class' of stammerers, but with no results

"The following year or two I took up a still more elaborate 'course' from a former college professor who drilled me in vocal exercises, and emphasized the need of the proper energizing of the pharynx After it was all over I talked as badly as ever

"When about 24 I took a cure advertised in the Chicago papers My instructions were to throw my head back when I talked After a row I finally got some of my money back

"Then I tried the Ennis method He told me to talk with my voice low in my chest (No results)

"A year after that I tried the Smith method Was told to listen to the sound of the words and feel my lips moving (No results)

"After this I answered the ad of a man named Carswell He conducted a Bible class in addition to his stammering business For \$90 he told me to keep my tongue stuck up in the roof of my mouth all the time I practiced it for a long time It did not improve my talking

"Five years ago I took the Perfect Voice Institute cure Here I was told to form a groove in the center of my tongue It did not help

"I next went to Mr Foote, who was a student of psychology under Hugo Munsterberg at Harvard Word reaction tests and rambling talks by him did not cure me

"My last experiment was in spiritualist healing I learned some very strange things, but my stammering remained just as bad as it ever was"

NOTE He concludes his letter by saying that if you think after reading my letter that something can be done for me, I shall be only too glad to come to New York and try again

The histories of the patients at our Hospital give similar experiences—that of receiving courses of treatment from school teachers, Christian Scientists, Osteopaths, Chiropractors, and of course the various arm swinging and time beating methods given by the different stammering schools strewn throughout the country

From ancient Biblical times to the present the subject has been considered and written about, but only within recent years has it been receiving the scientific attention that it deserves

During the past five years out of 5,000 defective speech cases, I have had under observation and treatment about 3,000 stuttering patients, and it is only natural that one should arrive at some conclusions in reference to these patients, which I hope will prove of interest

In the first place, to avoid misunderstanding it may be well to state the difference between Stuttering and Stammering They should not be considered as interchangeable terms, being two distinct classifications of speech anomalies

Stammering is defective enunciation which may arise from lack of development as, for instance, in the baby talk of childhood, or from malformations and traumatic interferences with the organs of articulation The continuity of a stammerer's speech is never broken, but the enunciation is at fault

Stuttering is speech of a hesitating nature which is conditioned on certain states of mind in the form of emotions, feelings, attitudes or ideas The continuity of the stutterer's speech is interrupted by spasms of the muscles involved in speech production The stutterer is able to enunciate every sound or combination of sounds Gutzmann describes the difference in one sentence by saying, "Stottern ist ein Fehler der Rede, Stammeln ein Fehler der Aussprache," meaning that stuttering is a defect of conversation while stammering is a defect of enunciation

The *symptom*, stuttering speech, is a neuro-pathic manifestation which has become a veritable obsession of a psychopathic or a psychasthenic individual, this state being the result of an unconscious motive, usually caused by the inability of the patient to adjust himself to some difficult situation

The nervous system of such an individual presents a special makeup, that of increased irritability with diminished capacity, a system that becomes easily affected from the least cause, and is constantly threatened with a break If trying conditions occur, lowering his resistance to a given point, then when an emotional disturbance of some force occurs, such as a shock, a fright, or an illness, the mental state is developed which precipitates his stuttering speech

Since the condition is endogenic, all having a heavy hereditary predisposition, the patient carries his burden all through life, though his symptoms can be kept in abeyance As a whole, these patients are peculiar, very emotional, impressionable, self-analyzing, extremely sensitive They are eccentric dreamers with romantic tendencies, are subject to attacks of great anxiety, to morbid fears and obsessions Introversion occupies an important place in the stutterer's makeup There is inability to focus the attention and maintain sustained effort at any work, and an equal inability to practice either mental or physical composure He is often a "Tiquerrur" and almost all demonstrate a marked condition of muscular inco-ordination

I feel sure that one cannot realize stuttering speech means and does to an unless he has had an opportunity to

hundreds of these cases. To me the stuttering individual is a special being whose span of life consists of the problem of physical existence without mental peace, trying to do things but always in a state of mental unrest. He lives in a world of his own making—Since his nervous system reacts abnormally to ordinary physical or emotional stimulation, he is in a chronic state of maladjustment and therefore has great difficulty in adapting himself to surrounding conditions.

In school, children suffer untold tortures on account of their defective speech. Finding that they are unable to hold their own they are prone to develop vicious cycles of thought and action. They show a lack of concentration, of attention, of self-confidence, a mental sluggishness due to inability to express their thoughts and of involuntary prevarication in order to cover their deficiencies. They are of a shut-in type, secluded from the very beginning of their existence. Inevitably their educational development always suffers. Most of those at the Clinic give a history of having left school or college because of their defect. Consequently, when older, they start the battle of life more or less handicapped, and it is surprising how small a percentage really attain their objective.

It is easy to understand that there are very few positions open to those who cannot talk. Unless one is gifted as a writer, an artist, or a musician, he has a very hard time to earn his livelihood or make any advancement.

Recently in our little magazine "Talk" we gave a computation of the earnings of 100 cases admitted to the Hospital during the last few weeks. In comparison with the statistics of the National Industrial Conference Board regarding wages and employment in 23 industries the stuttering group showed a definite loss of \$10 a week, or \$500 a year to each individual. This of course is directly chargeable to defective speech.

There is no royal road to the treatment of stuttering. Since stuttering is a psychoneurotic symptom, those that suffer from the condition must be treated as one would treat a chronic psychoneurotic. In reference to time, that means a long drawn out treatment. It is only when the stutterer responds to emotions in a normal way and feels free to express himself that his speech disturbance disappears.

The backbone of our treatment at the Hospital is based on two broad lines of endeavor:

- 1 To fit men to live agreeably in their environment
- 2 To enable them to live lives that are useful and helpful

In order to attain that objective a composite therapy of a medical, psychological, re-educational and social nature was found necessary. The doctor, the educator, and the social worker are the greatest factors for good when they are fused together in such a harmonious union that their adjustment completely saturates the maladjustment of these patients.

I realize the marvelous things that have been attained through specialism, but it appears that there is still room for a special physician whose index is speech,—a speech psychiatric, educational social working doctor, a doctor who is not only a speech specialist but one who is able to change and make over the individual.

The question naturally arises why an important work like this is still a problem. The answer is simple. The whole subject was never approached from the proper angle. In private practice very little can be done for these patients. The vast majority of them, on account of the many sided treatment necessary, could only obtain relief in a special speech hospital, and since there were no speech hospitals, ours being the first of its kind devoted solely to this specialty, interest could not grow and a practical solution of the problem could not take place.

It is quite evident that I am touching on the subject in a very broad way only. Lack of time hinders more detailed treatment. One thing is clear—the subject that was regarded as an uninteresting one to the medical profession is now recognized and coming into its own as a medical specialty. Of great interest is the change in our point of view. Stuttering speech was supposed to be a practically non-curable condition, now we are observing more and more complete recoveries. Also the interest has shifted from ages of theoretical discussion to the practical question of healing.

As soon as this problem of defective speech is known and fully realized in its true significance by our American people, their public spirit will undoubtedly assure the taking up, enthusiastically and actively, of a national movement for the advancement and standardization of this great and important work.

NOTE.—A practical demonstration of the work of the Clinic was given through the presentation of twenty patients who suffered from stuttering speech. They gave short talks in a normal, fluent style without any trace whatsoever of their former speech defect. These patients demonstrated the permanency of their cure because they had received treatment as far back as six years, five years and three years ago.

## NURSE TRAINING AS AN EDUCATIONAL PROJECT.

By ALBERT T. LYTLE, M.D.

BUFFALO, N. Y.

(Abstract from an address before New York State Organizations of Nurses at Buffalo, October 24, 1923.)

**T**HROUGH the æons of existence it has been woman's duty, self-imposed, gladly accepted, without thought of self, without heed of consequence, to care for the sick and afflicted. It is no wonder, therefore, that she peculiarly is adapted to carry on successfully those occupations which have for their base the physical welfare of humanity.

To one who is accustomed only to think of the nurse as a capable bedside attendant during sickness, the rapid and extraordinary development of her occupation comes as a profound shock. In the United States in the fifty years since the training of nurses was established, nurses have progressed from only caring for the sick at the bedside to duties that include some of the most vital, far-reaching public health and welfare activities. The trained nurse is found occupying positions of trust, management and research in institutional, educational, governmental and social service. To best secure the ends sought therein, the nurse personnel should be equipped with efficiency, initiative and vision that only can be acquired through an advanced degree of liberal education, technical experience and general culture. Such rapid growth, characteristically American, excites wonder and admiration. Any "chestiness" resulting from so startling a development easily may be forgiven while it is to be regretted that forgetfulness of the fundamental motive of nurse training has thereby been encouraged.

The amazing development of nurse education and nursing practice has been caused—probably along with the development of preventive medicine—by the extraordinary demand for women with competent nursing education to carry on public health and relief work. This has proceeded to such a degree that the fundamental reason for nurse training with the fundamental use of the word "nurse" is in danger of being lost to sight. That this wonderfully rapid expansion should invite caustic criticism was to be expected. From communications from every state in the Union received during the last few months such censure seems to arrange itself under commercialization, class consciousness, dearth of the spirit of service, shortage of nurses, lack of adaptability, and overtraining, and, it seems to come principally from three sources—physicians, patients and hospital managers.

When one recalls that nursing has been developed at the hands of physicians it is

amusing to note that these very criticisms also within the last few years have been expressed as caustically of the doctor. When physicians talk of commercialism, decline of the spirit of service, shortage and over-education, it more than suggests that "the pot is calling the kettle black."

When hospital managers complain of shortage of pupils, class consciousness and commercialization one cannot help but feel that the fault wholly lies with the hospitals, for they have been almost the sole seat for the training of nurses and their pupils and graduates have but adopted the principles inculcated by association.

When patients complain, caution must be observed in ascribing it to the irritability of the sick. Trained nursing not only has become a necessity in the best care of the sick, but because of the quality of individual sacrifice formerly so pronounced in service to the sick, has endeared itself to and enshrined itself in the fickle heart of the public. It, therefore, must be admitted that honest ground for honest complaint does exist, which strenuous effort should be made to correct.

In regard to the shortage of nurses, reliable statistics from governmental sources indicate that there is one trained nurse to each 700 people in the United States. If the estimated non-graduate and practical contingents be included the ratio goes to one nurse to about 300 of the population. It would seem from these ratios that there should be no lack of trained nurses to attend the sick. The complaint, however, is almost universal, and, especially is it so in regard to domiciliary nursing service. Generally speaking the shortage in so-called private nursing can be explained by the extraordinary increase in attractive opportunities for nurses in public health work.

In considering a solution of the shortage of family medical attendance and of domiciliary trained nursing care the question of sacrifice in carrying out the spirit of service carefully must be evaluated. The medical profession claims, and truthfully, that it ever has given a large share of its time and skill freely and without cost to those in needy circumstances. It calls attention to the hospital-dispensary-staff service with no remuneration as a shining example of personal sacrifice; admitting it to be a large financial loss such service is a time-honored method much sought after to improve the physician's ability, it has, therefore,

a true economic value. Similar and parallel personal sacrifice on the part of nurses, graduate and under-graduate, contains no such educational and experience compensation, it represents a total economic loss. The nursing profession should not be expected to offer free nursing service let alone be asked so to do.

Hospital managers call attention to their annual deficit as an evidence of hospital sacrifice in caring for the sick poor. It is a moot question if this deficit really is not due to poor management, particularly when it is recalled that hitherto both medical attendance and nursing service have been secured practically for nothing.

Hospitalization of the sick, paid by public taxation, has been offered as a solution of the vexing problem of domiciliary care. As this is a species of pauperization and conduces to a low standard of citizen responsibility and morality it should be promoted with extreme caution.

The suggestion advanced in the report of the Committee on Nurse Education to train women to act as "sub-nurses," thereby to eliminate the so-called practical nurse, or to be a sort of intermediate group between the expert and the practical nurse, in order to supply the shortage of bed-side attendance, is a very dubious solution of the problem. Experience since the New York law created a group of nurses in 1920 to be known as "trained attendants," is not proving this movement a success, notwithstanding the statements made with regard to the Missouri law, while the licensing of practical nurses in Maryland in 1922 is too recent for comment. "There remains the larger doubt whether the young woman of good red blood and normal ambition is to be found anywhere, in any material numbers, who wants to be a 'sub' of any kind." "The 'sub-nurse,' with her store of little knowledge will be dangerous simply because she does not know the end of her tether. No tag will efficiently label her. No law will keep her within stated bounds." Economically the public would suffer, for the "sub-nurse" would consider because she does the same work, that her wage should equal that of the highly trained nurse. Experience along this line with the practical nurse is all too positive not to appreciate this statement.

Another solution of this problem whereby the public receives the expert service of the "registered nurse," lies in the hourly service plan but like all substitutes it is impossible for hourly service, however expert, properly to supply that needed care of the family which full time bed-side service alone can secure. No one with a thimbleful of brains for one moment would derive the necessity for, and the value of, the service rendered to the so-called poor and to

those of limited income, just a jump ahead of poverty, by the efficiently conducted district nursing associations. But, as the service of these organizations is an hourly service it has the same effect.

Where the home is large and well equipped, and money is available, the family can command the best nursing service and sufficient domestic help to meet the emergency. Poverty in the home is always aggravated by sickness, and it is often necessary to appeal to charity for relief. Between these two extremes are those that live comfortably as long as they are blessed with health and an opportunity to work, when sickness comes, reducing the family earnings, strict economy must be practiced to avoid privation and debt. The family is usually obliged to put up with the cheapest and most inefficient help, and it often follows that such service is more expensive in the end than that which wealthy people employ.

There was incorporated in Buffalo in 1914, as elsewhere, with the aid of the Thomas Thompson Trust of Boston, The Buffalo Emergent Home Care Society, to furnish practically at cost whatever nursing or domestic service be needed in the homes of that 80 per cent of the people of very modest income, where sickness or other allied emergencies existed. It did not aim to make any financial profit and it would not undertake to render service without compensation. Its motto was, "Organized Neighborliness." It was a business agency for securing the right supply at the right time, saving friends unnecessary suffering and expense, and employers unnecessary loss in commercial and industrial efficiency.

The methods of this Society are best shown by quoting from its circulars. "We offer, when emergency demands, skilled nursing and efficient household service *under supervision*, all at a price within their (the household) means. We offer expert investigation of every case of sickness or allied emergency, and to furnish the help that will best fit the case as long as help is needed, and to decide whether to send a trained nurse, or one who is partially trained and works under supervision, or a woman who can attend to the housework, and thus release a member of the family for the care of the sick."

Unfortunately, for its motive was help without pauperization, the onset of the World War disrupted the development of this experiment in a much needed nursing and social service, which strove to maintain and develop that self-respect and self-reliance so necessary to the growth and continuation of those high ideals of individualism of the founders of our government.

The criticism of the nursing wage hardly concerns the sum asked, for, unlike medical service,

the people appreciate and properly evaluate the personal service of the nurse. The complaint is rather against the inability, easily to meet the charge and its concomitant expense. It, therefore, behooves the professions of nursing and medicine to devise ways and means to furnish to the great majority of the people an efficient service, promoting recovery from disease, and maintenance of health at an outlay commensurate with family income—a service of inestimable value in maintaining and developing that self-respect and self-reliance.

In 1919, on the concept of interlocking relationship, the author was instrumental in bringing about the incorporation of the Health Conservation League, designed to promote economic and legislative cooperation of the four professions of medicine, dentistry, pharmacy and nursing, by uniting in a common body, annually elected representatives of their several existing organizations. Owing to persistent malicious misrepresentation the powerful influence for good of this very useful organization has been allowed to languish.

From the standpoint of the practicing physician the fundamental purpose of nurse training—the production of trained nurses to care for the sick at the bedside in the home—is not producing an adequate supply. Institutional care gradually is replacing domiciliary care, for which deplorable situation it seriously is stated that undergraduate education is in large measure responsible.

Slowly but surely social movements for the prevention of disease and the maintenance of health are working evolutionary changes, especially in the vocations of medicine and of its hand-maiden nursing, so that the care of the sick, while an inevitable and highly important duty of both callings, no longer occupies the entire professional horizon.

That young women desiring careers that involve high educational values of the university type of nurse education are being attracted by the opportunities in public health, social welfare and other work, is evidenced by the number of high school and college graduated young women entering nurse training, with no intention of following bed-side or domiciliary nursing but for the sole purpose of filling administrative, teaching and research positions in social and public welfare.

Modern education of nurses in the United States dates from 1903, in which year New York State checked the previous chaotic condition by enacting a law that determined a minimum standard for nurse training schools, and which granted the degree "R N" to those successfully passing its examinations. Educational or scholastic teaching began to be stressed and nurse

training emerged from a trade into a profession. Extra-mural schools began to be established and universities to create nursing-educational departments.

That hospital management still clings to the charitable and disciplinary principles of service and nurse education as inculcated by the German-English class military system of Florence Nightingale, is shown by conclusion No 5 of the Report of the Committee on Nurse Education. When one considers that this Committee consists largely of individuals, closely connected with hospitals and hospital training schools, this conclusion, to say the least, is illuminating.

Conclusion No 5 reads: "That, while training schools for nurses have made remarkable progress, and while the best schools of today in many respects reach a high level of educational attainment, the average hospital training school is not organized on such a basis as to conform to the standards accepted in other educational fields, that the instruction in such schools is frequently casual and uncorrelated, that the educational needs and the health and strength of students are frequently sacrificed to practical hospital exigencies, that such shortcomings are primarily due to the lack of independent endowments for nursing education, that existing educational facilities are on the whole in the majority of schools inadequate for the preparation of the high grade of nurses required for the care of serious illness, and for service in the fields of public health nursing and nursing education, and that one of the chief reasons for the lack of sufficient recruits, of a high type, to meet such needs, lies precisely in the fact that the average hospital training school does not offer a sufficiently attractive avenue of entrance to this field."

How like a boomerang the whole hospital-school movement has acted. Under the guise of philanthropic acts for the benefit of the blindly innocent public, hospitals and physicians have used the trained nurse and the training of the nurse for purely mercenary ends and for personal advancement. Today the nurse is using the hospital as a laboratory in her educational system, and the average hospital management is at its wits' end to find plastic material with which to run the hospital. Have they "killed the goose that laid the golden eggs"?

The passage of the New York law that since has been adopted, with slight modifications, in practically all the states of the Union, foreshadowed the ultimate passing of the hospital training school. During the agitation over its passage an effort was made to have the word "nurse" only apply to those having the required standard training. The furore ended in restricting the use of the appellation "Registered Nurse" to those successfully complying with the require-

meets of the law. The word "nurse" could not be wrenched from its generic use.

Nurse training or education has reached a stage of development in which two distinct types must be considered, the one—fundamental—care of the sick under the physician—in which training as distinct from education should be stressed, and, the other—superior—teaching and health welfare activities—in which education as distinct from training should be stressed. But the system and methods of procuring cultural values and competent equipment must not lose sight of woman's biological inheritance.

In the first or fundamental type, the personal service or trade idea is uppermost. Its quality and function more nearly parallel those of the highly skilled mechanic. The skill of the mechanic is dependent upon intelligence rather than upon education, judgment and knowledge are acquired by iteration and by experience although no sane person doubts the value of education and of culture, in learning and in following a trade requiring a large modicum of skill. Success comes earlier, economic outlay of time and money is less, usefulness and service are equal to even if different from those of the professions.

In the second or superior type the professional idea is uppermost. Its quality and function more nearly parallel those of the professions of law, medicine, and the ministry, than do such other accepted professions as music, drawing, mechanical engineering, electrical engineering, and like vocations.

If these concepts are true the difficulty lies in the present evaluation of entrance requirements, both educational and age, of professional theoretic education, practical training and time, of the relations of schools and hospitals, of domiciliary service and professional activity.

Most hospital training schools make the minimum entrance age "at least 18" while the educational requirements range all the way from a complete four year high school course down to "those applicants with the best qualifications will be accepted on probation for three months." That "probationary period" is a grotesque anachronism in an educational system.

In the beginning sentimental prudery considered it very improper for girls of high school age because of immaturity to experience the contacts inevitably associated with intra mural practical hospital training. The high school girl of today, however, is quite as sophisticated as was her grandmother at twice her age.

Many girls at about fifteen are compelled to drop schooling on graduation from the grade school for social or economic reasons, subsequently opportunity permits satisfying the longing for further education. Such young women are intelligent, and have acquired valuable ex-

perience and a right perspective of life, so that they should make most excellent nurses, but they are lost to the nursing world because the to be high entrance requirements and the completed nurse education would require seven years, over half of which would be unremunerative. An intelligent girl, who has been self-supporting, often would hesitate and finally would abandon the idea of nurse training because of so great a handicap. The time for education is all too short. "According to some psychologists it is a serious fact that mental plasticity largely closes with youth."

In the three years hospital attendance generally required, with vacations and days off deducted, 9,874 hours are devoted to educational work, of which theoretical instruction takes 595 hours, and practical training (laboratory work) 9,279 hours—no wonder undergraduates "go stale" in senior semesters! After several written and verbal examinations, one of which is conducted by the State, for this immense outlay of time, the nurse receives a diploma which has no greater cultural value than that of the high school—in Philadelphia a high school confers a bachelor of arts degree.

To the 9,874 hours of the three years hospital training, add the 3,840 hours of four years high school attendance, and the Standard Curriculum requires, with the extra-mural study hours, many more than 13,119 clock hours to secure an "R N" degree during the seven years time. Exclusive of the hours given to special technical topics that have little or no cultural value, the subjects pursued in the hospital are similar to and in educational value no greater than those pursued in the high school.

As an educational project the fundamental domiciliary type of nurse training school management ultimately will be completely separated from hospital management. Its maintenance and conduct will fall upon the public under the direction if not control of the State Department of Education. Such nurse training schools then will become as much a part of the State educational system as are the normal schools, the high schools and the academies. Direct State control probably will stop at the close of what is today the "R N," or graduate nurse stage.

By a carefully planned gradual advancement covering four years rather than three, the girl of high school age, of sufficient intelligence to carry on the work, could cover the theoretical and practical training demanded for the "R N" as well as the educational requirements for a high school diploma, if nurse training became a branch of technical high school work under State control. By proper adjustment her diploma would permit immediate entrance to university schools. With her diploma she would have acquired prac-

tical efficiency in nursing of sufficient grade, expertly and intelligently to do domiciliary nursing, or to do nursing in hospitals having no training schools. Hospitals, private physicians, as well as the public, would be assured of ample nursing service.

The nurse training high school would have a cultural course of education going along with a practical hospital bedside training, together covering four years time of about 10,000 hours. The diploma granted its graduates would stand for a general education equivalent to that of a high school, and a technical education nearly if not quite that represented by the degree "R N". In other words, if the State should require that entrance to a nurse fundamental training school be the same as for entrance to the high school, if it should require that the fundamental nurse training school give a liberal education, equivalent in time and quality to that of the high school and acceptable to the State, the graduate from such nurse training school would meet all the requirements now demanded for the granting of the "R N" degree. The woman entering

nursing could stop at this point to follow domiciliary service, or she could enter university schools and by further education obtain bachelor, master or doctor degree, and thereby qualify for the more important position in public health and nurse education work.

It is conceivable that this scheme in no way would lower the desired standards of nurse education, while it is probable that it would supply a sufficient number of well qualified nurses to fill the demands of the fundamental calling—the nursing of the sick.

This idea has many revolutionary aspects and takes the girl into the hospital at an early age. However, a careful survey of the Standard Curriculum shows that it would be possible by increasing the attendance time to four years to extend certain of the basic scientific subjects, to add other high school topics of cultural value (Table "D"), and to bring that part of practical hospital training which by virtue of its character has elements of danger for a girl under the age of eighteen to a time now accepted as quite proper. The girl graduating under such condi-

tions could take up college work several years earlier than it is possible to do today

The upward of 1,800 recognized nurse training schools in the United States should be pared down in the same manner as has been the medical schools through the activity of the American Medical Association, so that shortly only those schools should be recognized that are capable of giving a standard practical nurse training, fitting for what has been called domiciliary service, or first type

Nurse training for the second or college type is an educational project, the cultural value of which not only equals that of other professions, but is in many ways superior, because of its opportunities for human contacts and for its early influence in developing and improving those basic human qualities that make for the production of better men and women in all fields of human endeavor

In these professional type schools in addition to courses leading to collegiate degrees, advanced practical training must be given, for there is no question of its necessity as an essential part of the equipment of those who are to carry on the work in the fields of disease prevention, health improvement and social welfare. An enlarged vision indicates that the places in life's work-shop yet to be filled by highly educated trained nurses are many, although therein the actual practice of nursing never will be called into use

This superior or college type of nurse education for which the Standard Curriculum and the National Nurse Associations are striving will fall under the management of universities as branches of that broad education so clearly envisaged by Dr. E. P. Lyon of the University of Minnesota in an address at the 58th Convocation of the University of the State of New York at Albany in 1922

That this actually has developed is shown in the establishment of schools of nursing as integral parts of university systems in the states of California, Connecticut, Indiana, Michigan, Minnesota, Missouri, Nebraska, New York, Ohio and Washington. Such universities of national repute as Columbia, Leland Stanford, California, Western Reserve, Yale and others have schools of nursing all of which grant Baccalaureate degrees

Education is the acquirement of knowledge through experience, whether that experience be one's own or that of others. It includes the cultivation of body, mind, feelings and manners. Nursing education of the two types above described includes all of this

No other system of vocational training so nearly can be made to meet the broad aims of a liberal education as that suggested. The adoption of the scheme herein advocated would divide the schooling periods of a girl's life into primary, secondary and collegiate courses as is the general plan of today. In all of these periods "book-knowledge" which experience has found valuable is obtained, while, beginning at a time when the mind particularly is plastic and impressionable, come a series of contacts and experiences of a personal nature, all under careful supervision, that are more varied than can be found in any other vocational training and which gradually increase in breadth and intensity so that the "eternal verities" of life are visualized more clearly and their values more surely appraised. In addition to the knowledge and training secured is the spiritual stimulation of the possession of skill in a vocation that offers not only a livelihood but that quite fully satisfies the biologic fundamental yearnings of the female organism

If the statement is true that 80 per cent of all girls marry, the potential life-occupation of most high school girls is home-making and family rearing. It takes little imagination to visualize the utilitarian value of such nurse training education as a preparation for this supreme vocation of life and to appreciate the importance of its obligation to society

Nurse education "develops practical judgment, self-reliance, responsibility and a knowledge of men and affairs." As "the worth of human society is proportioned to the frequency of occurrence of men and women of keen aspirations, intelligent social purpose and disciplined character," all of which attributes of personality nurse training tends to develop, the value of nurse training as an educational project to round out the individual life easily is understood and admitted

## AN OPEN LETTER TO GOVERNOR SMITH, AND MEMBERS OF THE SENATE AND ASSEMBLY OF THE STATE OF NEW YORK

We most respectfully call your attention to a photographic copy of an advertisement which appeared in the *Amsterdam Recorder*, on March 4th, 1924, relative to the present status of the illegal practitioner in the State of New York.

Pending legislation is proposed to clean up the State of New York. It may not be out of place to ask you a few questions:

(1) Do you honestly believe that the best interests of the people of the State of New York can be served by such gross misstatements of facts as appear on the adjoining page?

(2) Do you feel that any school or group of persons who openly make such violent claims as are herein printed, are properly qualified to protect the public from sickness and disaster?

(3) Do you feel that you are really and truly serving the people as a whole, safe-guarding the public health, and maintaining proper standards of education, when this sort of illegal work is going on daily in the press?

We would like to call to your attention the fact that the medical profession is a dignified body that has neither the time nor the money to appear in the public press under the advertising columns. It is against the ethics of the profession to place in print facts which would extol any particular method of treatment or any particular physician. This method of advertising would disqualify a reputable physician from the respect and consideration of his associates.

In asking for your fullest co-operation to rid the State of quacks and illegal practitioners, we would ask that you take into consideration the standards of the practice of medicine which have been properly established by your constituted authority, and vested in the Department of Regents at Albany. The law assumes that practitioners of medicine shall be able to make intelligent use of the modern, up-to-date methods that are available for diagnosis and treatment.

# ARE YOU GOING TO SUBMIT TO MEDICAL TYRANNY? HELP SAVE OUR COUNTRY FROM THE AUTOCRATS!

## AMERICANS AWAKE!

### MEAN AND WOMEN OF NEW YORK STATE:

Do you know that there is now on foot an audacious movement, designed to place in the hands of the Medical Trust absolute power to determine the fitness of any and every practitioner of the healing art?

Do you know that every practitioner no matter what his training or method, will be required to conform to the requirements of a State Board of Medical Examiners, appointed by a State or County Medical Society which in turn, is merely the mouthpiece of the American Medical Association?

DO YOU KNOW THAT THIS ORGANIZATION IS PERHAPS THE MOST ABSOLUTE AUTOCRACY EXISTING ON THE FACE OF THE CIVILIZED EARTH TODAY—the Russian Czar and his dukes no longer being contestants for this honor?

Do you know that there is now on foot, under the guise of a hygienical pretense of protecting public health from every body but themselves, A MOVEMENT THAT WILL LEGISLATE OUT OF BUSINESS OR INTO JAIL PRACTICALLY EVERY DRUGLESS HEALER in this state?

IF THESE SELF-SACRIFICING ALTRUISTS—members of the MEDICAL TRUST—have their way which now seems quite likely, unless you people of AMERICA WAKE UP AND SNAP THE CHAINS NOW BEING STEALTHILY BOUND AROUND YOU, no Chiropractic, Naturopathy, Hydrotherapy, Physiotherapy, Mesotherapy, Dietitian or other man or woman who overcomes disease by removing the cause, can practice his art!

THERE IS A BILL AT PRESENT BEFORE THE NEW YORK STATE LEGISLATURE WHICH, IF IT PASSES, WILL GIVE THE SO-CALLED "REGULAR PRACTITIONERS" SOLE AND EXCLUSIVE RIGHT TO TREAT THE SICK IN THIS STATE.

The Bill also provides for "persecution of cases of illegal practice by the office of the Attorney General of the State, in place of the District Attorney, and the obtaining of evidence by inspectors, working for the Department of Education, rather than by the Medical Society in the County in which the alleged crime is committed."

*Photographic reproduction, two-thirds size, of an advertisement which appeared in "The Recorder," Amsterdam, N Y, on March 4, 1924*

A FINE SCHEME NOT ONLY FOR TAKING THE CASE OUT OF THE JURISDICTION OF THE DEFENDANTS HOME TERRITORY BUT ALSO FOR REPEATING THE MEDICAL SOCIETY OF THE EXPENSES CONNECTED WITH SECURING EVIDENCE AND PROSECUTING THESE CASES. MEDICAL OR NOT, PASS UP YOU WILL BE COMPELLED TO TAKE A. M. A. TITAN COULD GIVE YOU TREATMENT OR HYDROPATHIST OR HOW TO CURE YOURSELF BY WHOLESOME DIET

YOU! TAKE YOUR A. M. A. DOSE OR DO WITHOUT!

HOW DO YOU LIKE IT?

Are you going to demand your rights as a free citizen to select the doctor of your own choice and the method of treatment (preference) OR ARE YOU GOING TO LET THE RING SADDLE AND BRIDLE YOU AND THEN DOWEL YOU IN TO THE ROAD OF ITS OWN CHOOSING?

IF THERE EXISTS IN YOU ONE iota OF THE SPIRIT OF JUSTICE, EQUITY AND LIBERTY SIT DOWN NOW AND WRITE THE SENATOR AND ASSEMBLYMAN FOR YOUR DISTRICT. TELL HIM IN NO UNCERTAIN TERMS HOW YOU FEEL ABOUT THIS PROPOSED ENFRANCHISEMENT ON YOUR RIGHTS AS A FREE AMERICAN CITIZEN

Take this matter up among your friends. Araken them to the realization of their danger. KEEP THE MATTER ALIVE, OR THEY WILL SLAP IT OVER ON LIBERTY. REMEMBER THAT "ETERNAL VIGILANCE IS THE PRICE OF LIBERTY."

YOU CAN PREVENT THE PASSAGE OF THIS VICIOUS MEASURE BY WRITING TO YOUR SENATOR AND TO YOUR ASSEMBLYMAN IN PROTEST AS FOLLOWS

Honorable Sir: I, the undersigned, one of your constituents, most emphatically object to the passage of the Carroll Latta bill and to all other legislation adverse to chiropractors and ask that you help defeat this measure. It is also my wish that you support the chiropractors' bill to give them legal recognition in New York State.

Signed

Write to Hon. Alan B. Bloomfield,  
Senate Chamber, Albany, N Y

WRITE NOW, before it is too late.

And to Hon. Samuel W. McCleary,  
Assembly Chamber, Albany, New York.

YOURS FOR FAIR PLAY.

## CHIROPRACTORS OF AMSTERDAM

*Photographic reproduction, two-thirds size, of an advertisement which appeared in "The Recorder," Amsterdam, N Y, on March 4, 1924*

The law rightfully assumes that no man can acquire the minimum qualifications for practice until he has devoted four years of special study to a preparation for practice. This standard of training has been accepted by every State in the Union, and by all civilized countries, as the least time in which a person can become qualified to diagnose and treat human diseases, and yet chiropractors claim to be able to qualify in from six weeks to six months. The law and the Regents have made the standards of the practice of medicine sufficiently high and carefully enough guarded to safeguard the public welfare. This has been done only after many years of patient endurance and constructive work. These standards are jealously guarded both by physicians and the public. We both realize that a lowering of standards so carefully considered could do nothing but work a grievous injury to the public health of the community.

Under these circumstances the Department of Regents at Albany has justly asked that certain definite standards be maintained to qualify anybody who chooses to practice as a physician. Unfortunately, the most outstanding breaker of the law, at the present time, is the chiropractor. We assume there must be a reason why this cult has grown so rapidly. We again assume it must be for the financial return in proportion to the amount of time and money spent in preparation. In other words, the desire to take up this method of treatment is not for the benefit to the people, but for the money to be obtained, it is purely financial. We are informed that after only six weeks of study they are supposed to be qualified to practice "chiropractic." At the end of this time they are presumably, according to their own standards in a position to take so-called "patients." We again assume that if they are taking these patients, they are taking them because they expect to do them good. But we fail to see how they can start any type of treatment without properly endeavoring to find out what is the matter, in other words, without making a diagnosis. If our assumption up to this point is correct, they have been and are making a diagnosis and applying the treatment, both of which constitute the "Practice of Medicine" as defined by the medical law of the State. There can be no deviation from this conclusion, if our premise is clearly stated.

The State of New York grants the title of M.D. and the use of the word "Doctor" to a properly qualified medical practitioner who has passed the State Regents. The title of "Doctor" is gained after four years of close application of medical standards and only after a properly qualified medical school has thought the candidate fit to receive a degree. What we wish to bring to your attention is the fact that in the word "Doctor" there is a dignity which entitles

it to the fullest respect on the part of the community. If this title is lightly used by anyone unqualified to possess it, he is stealing not only from the medical profession, but from the people of the State of New York, as he is implying, from the very use of the word "Doctor," a qualification which he does not possess.

Our attitude is to clean up the State. Our desire is not to legislate any properly qualified person from pursuing what the State deems safe and wise for the welfare of the people. We would call to your attention the fact that one particular "cult" has been guilty before the law for a number of years and has never been properly prosecuted. We call your attention to the fact that its so-called "spinal adjustment" has been used to cure fractures of the elbow, diphtheria, cancer, and tuberculosis of various forms, both of bone and lung, and doubtless many other conditions, on the premise that some mythical adjustment of the spine can work a miracle. We would call your attention to the fact that the present chiropractor has but one motive, and that is this: he wishes those who at the present time are practicing *illegally* to retain this privilege *lawfully*, he wishes that standards hereafter shall be raised to keep out any future inroads of competition in his cult, he wishes to be a judge and jury as to who are qualified to practice; he wishes to be the Examining Board, the Board of Regents, and the Board of Discipline,—and he wishes all this in spite of the fact that the State already has a Board of Regents, which is created by the people of the State to safeguard them against this very evident and illegal abuse. If this thing is to continue, why not abolish the Board of Regents entirely and throw the people open to every form of charlatanism which may exist? Let us either have standards and observe them, or abolish standards altogether.

The medical profession has been accused of persecution. Physicians have no more desire to persecute a qualified man than they have of practicing law. We can readily understand why a man who is doing things wrongly, and against the law, should promptly raise a cry of abuse when he is required to conform to lawful standards, particularly if in conforming to law it legislates him out of business.

It is now about time that we clean up our State and try to run the government for all of the people, and not try to lower the standards of our people to the standards of cults, who in such a voluminous way will deprecate the whole medical profession, as they have in the adjoining advertisement. This is illuminating. It should make you men think—make you understand that your trust in the legal halls is as sacred as the trust of the physician to whom you give the care of your sick wife and children.

May the time never come when you shall be deluded by any make-shift of this sort and lose a chance of saving someone dear to you when level-headed medical or surgical help is available.

The coupon system attached to this advertisement should require no explanation. If the laws of the State are to be reduced to a guessing contest entitling the Senator or Assemblyman to a free trip to Europe, we indeed have come to a most deplorable condition of affairs.

Will you not give the attached coupon the respect, or lack of respect it deserves. The medical profession never can, nor ever will, try

to combat in a money way the blatant advertisements which must spring up all over the State in the hands of chiropractors.

We feel that our problem can be safely entrusted to our law-making bodies. We hope, believe, and trust that you will uphold what is right and just and that your program will so endear you to your constituents that they will be glad to see you back at your tasks in the fall.

ORRIN SAGE WIGHTMAN, M.D.

*President, Medical Society  
of the State of New York*

## EVIDENCE FROM CHIROPRACTORS

Strong evidence of the expected efficiency of the proposed Practice of Medicine Act is shown by the feverish attempts of chiropractors to defeat the law.

Read the copy of one of their advertisements that is reproduced on page 347 of this JOURNAL. *It admits that the law will be efficient.* The chiropractors appeal to all other cultists to join them in opposing the law.

What is there in the proposed law that frightens the cultists? The law lets the *definition* of the practice of medicine remain exactly as it has been for ten years, and the chiropractors make no opposition to it. What they do oppose is an unbiased investigation into their practices, and their *promises* to work miracles of healing every conceivable ill. Their arguments are along two lines:

1. Their system of healing is efficient and safe.
2. Their opponents are actuated by merely selfish motives.

The evidence which the chiropractors claim for the value and success of their cult is that of "testimonials" of persons whom they have treated. Numbers of persons say chiropractors have helped them and, therefore, chiropractic has been proved to be both safe and efficient. This argument is like that of a man who allows his ten year old boy to start, stop, and steer his automobile and then claims that the boy will be a safe chauffeur under any conditions.

The facts are that chiropractors solicit business and promise cures of impossible conditions. A glaring example of their practices has been that of promising to cure the paralysis resulting from infantile paralysis. Those of us who have worked with the Department of Health of the State and of cities have seen numerous cases whom chiropractors have subjected to exercise and manipulations in the first weeks of the disease while absolute rest offers the only hope of cure or improvement. After weary weeks of

treatment parents with little financial means have often fallen a prey to chiropractors who have promised quick cures of the children—always for a price. In no instance have we heard of free treatments being given or free clinics held by the chiropractors. Their whole motive is gain and not the benefit of humanity.

Since the chiropractors cannot answer the arguments of the medical profession, they adopt the usual tactics of assailing the motives of the proponents of the law. They state that physicians are actuated by improper motives because they wish to form a healing trust and to hold a monopoly of the practice of medicine. Since chiropractors open the question of motive, we may properly discuss their motives. Chiropractors say they wish to "Regulate" the practice of chiropractic by examining and licensing future applicants, while allowing the present practitioners to continue. The truth seems to be that competition among chiropractors has become so keen that new accessions to their ranks threaten their individual incomes. They, therefore, would institute a system of examinations which would prevent any more students from obtaining licenses, and thus the present chiropractors will be free from increased competition. Is this a mere threat or opinion? The osteopathic law does this very thing. A law legalizing and licensing osteopaths was passed in 1907 and since that time only one or two have been licensed each year. The chiropractors wish to have the same thing done for their benefit. The tactics of chiropractors remind us of our early automobile days when we could go only about fifteen miles an hour, and yelping dogs used to run ahead of us and throw sand into our eyes with their hind legs at every jump, knowing we could not catch up to them. The chiropractors have not been afraid of the one cylinder law, but they are in deadly fear of the new six cylinder act.

## WHEN IS A MAJORITY A MAJORITY?

THE attention of the President of the State Society has recently been called to the fact that special meetings have been held in various parts of the State to consider pending legislation. We are told these meetings are held at the request of a small number of men, in New York County fifty names signed to a petition may secure this special privilege. When these meetings are assembled, the subject for which they are called is duly debated and considered. At the end of the meeting a vote is taken and the recorded vote is duly interpreted as the attitude of that particular county on the question under consideration. When the State Society is launched upon any program involving its own integrity and the welfare and health of the people of the State, meetings of this character may give a false impression as to how the profession as a whole think on any subject. For example, in New York County a meeting was recently called to consider and discuss the amended medical practice act now before the law-making bodies at Albany. At this special meeting there were present about 90 men. After the question had been duly debated, pro and con, a vote was taken and 36 were for the Bill, and 34 voted in the negative.

The question raised is how far the actual numerical vote of 66 can stand for the true feeling of over 3,100 men who now are members of the Medical Society of the County of New York. Special meetings are very prone to bring out those who are particularly interested. They appeal to a group who like a contest and usually do not succeed in bringing out the conservative backbone of any society. These latter men are too busy with the every day practice of medicine to come out and openly fight against things which do not minutely concern them. If this is a fair example of how legislation may work by special meeting, is it not about time that we either remedied this condition by making a referendum vote of the whole County society necessary in order to place it upon record, or else to

constitute a definite percentage over and above the present quota required, so as to secure a more honest opinion on the part of a County Society?

It would be deadly for any large County Society to be placed upon record upon any legal matter vital to its survival, by fifty men or less, when the membership runs, as in New York County, to over 3,100.

The medical profession are thoroughly able to speak for themselves. They are an intelligent group of men who rarely delegate power of free speech to any small group, be it positive or negative.

It would be well for those who are revising our Constitution and By-Laws to take this matter under serious consideration as it will save the society a good deal of future embarrassment.

Our Assembly and Legislature in looking for political reasons in voting for or against a medical measure invariably quote action of the counties throughout the state. As a matter of political expediency they may be all too glad to quote a vote of any fifty men when in reality they are representing 3,100. It gives another unwise advantage to personal exploitation on the part of the medical profession for a real or imaginary grievance on the part of an individual. There is no group free from somebody who for reasons sufficient unto himself feels that he is the champion of the unknown quantity X. With this mark on his escutcheon he sails forth like Don Quixote to conquer windmills.

The glory attended is not so much for the state as for the personal advantage of the man who assumes this self-imposed task, and who in the light of the public poses as a majority, therein lies the danger and weakness of a minority action.

Let us take this matter into serious consideration when framing new laws for our own State Society government.

O S W

## THE ROCHESTER MEETING

A review of the program for our Annual Meeting to be held in Rochester, on Monday, Tuesday, and Wednesday, April 21, 22, 23, reveals a most impressive array of talent concentrated upon subjects of such vital interest to every member of the Society that not only the Delegates who convene on Monday, but every other man, physically able, should avail himself of this opportunity to attend as many of these sessions as possible.

The Committee on Scientific Work is to be highly commended for serving such a remarkable amount of most valuable material in a two-day session.

Rochester is an interesting city to visit, has ample accommodations for a large State Meeting, and the fact that Dr. Owen Jones is Chairman of the Committee on Arrangements is sufficient guarantee that every possible thought for

the comfort and entertainment of members and guests will be provided

In addition to the scientific and social features of this meeting, the Commercial Exhibits will be well worth careful attention. All of the exhibitions are carefully censored, and represent the newest and best offerings that can be shown by reliable firms. Physicians can not fail to find satisfaction in replenishing their armamentaria, and adding up-to-date equipment from the modern things that will be shown. The exhibitors are old friends and deserve our confidence and patronage.

The annual banquet on Wednesday evening

should be attended by everyone who attends this meeting. The economic, administrative, and scientific side of these meetings is, of course, of great importance, but there is also great value in an opportunity for the social intimacy that a dinner affords. All of the different groups are here assembled to cement old friendships and to make new ones. Physicians see very little of that side of life at home. We think it would be a good idea if every member of the Society should make this the occasion of a reunion with as many of his medical classmates as possible. We urge correspondence in these groups and a real effort to assemble them at special tables.

N B V E

### CONSTRUCTIVE CRITICISM

The great subject with which the NEW YORK STATE JOURNAL OF MEDICINE has to deal is the proposed Practice of Medicine Act which was printed in the February 22 issue of this journal. Criticisms of this act may be divided into two classes:

- 1 Constructive.
- 2 Destructive.

We have received examples of both kinds of criticism and have printed them impartially. The time has now come when we may estimate the value and the effects of both kinds of criticism of the bill.

We may properly ask—to what degree will the proposed act rid the State of illegal practitioners of medicine? Assuming that the officials connected with the Regents and the Attorney General's office are active and conscientious—as we know that most public officials are—then we may expect that the execution of the law will be 90 per cent perfect.

There is a group of critics who say that the law will not be executed at all, and that it will amount to nothing. When we ask these critics to suggest other features which will make the law effective, they reply that making the law is no concern of theirs. These critics belong to the destructive group. They stand on the side line and find fault with the players. They themselves cannot be criticized for the law or for arguments in its favor, because they have had nothing to do with its making. A destructive critic can criticize the other fellow and yet he himself may be immune from criticism. Happily this group of physicians is not large.

A second group of critics of the proposed Practice of Medicine Act object to minor features of the law, but yet recognize the great value of its major features. When the physicians of this group are asked to give constructive criticisms and to suggest something better, they quickly comply with the request and say that they would execute the present law. A Brooklyn

group of constructive critics has not waited for the passage of the Practice of Medicine Act, but has already made a canvass of the practising physicians of the city and has discovered three doctors practising under the diplomas of dead physicians. The criticism of the constructive critics is directed mainly against the re-registration feature of the act. They claim that re-registration and the imposition of fees is wrong in principle, and that this slight wrong will vitiate the good features of the act. There is ground to fear that this feature may lead to some slight embarrassment, for already the cultists claim that the doctors are offering to put up money fees from the selfish motive of driving their competitors out of business. But we must remember that the making of the law is vested in laymen who desire to retain the fee system because it already exists and is applied to seven other professions allied to that of medicine. It is good policy for physicians to accept the re-registration features with its minor annoyance, rather than to oppose the passage of a law which is *the best* that has yet been proposed. So far as we are able to judge, the main features of the proposed Practice of Medicine Act are accepted in good faith by physicians generally, and are opposed by only a small group who refuse to suggest anything better.

*An Appeal to Physicians.* Now is the time for your constructive action. The proposed Practice of Medicine Act has been before you for three weeks, and its broad features have been discussed and generally accepted. Also the plans of the cultists have been disclosed.

You have been informed of every step that has been taken in the construction of the bill. The step for you to take is to inform your Senator and your Assemblyman of your attitude regarding the act. If you do this, the legislators will act with confidence, and will do their part to maintain a high standard of medical practice.

F O

# LEGAL

By GEORGE W WHITESIDE, M.D

## LIABILITY WHEN A PHYSICIAN LEAVES A CASE IN CHARGE OF ANOTHER PHYSICIAN

When you leave your practice for a week-end or for a more extended vacation and place in charge of your patients a substitute to act in your absence, you would hardly expect to be sued for damage claimed to have been suffered by a patient in your absence and alleged to have resulted from the treatment given by the physician who substituted for you. Such cases, however, have arisen in our experience. In obstetrical work physicians often find it necessary to send a substitute at the time of delivery because of their absence on other cases, or by reason of their being away on vacation at that time. This circumstance has likewise been the occasion for dissatisfied patients suing the physician who had originally accepted the case. It may be interesting and possibly profitable, therefore, to examine briefly the law as enunciated in adjudicated cases on this question. In these instances referred to we shall assume that the physician who is substituting is not in the employ of the physician who had charge of the case, but is a physician to whom the patient has been referred during the former's absence. The courts in this state have said practically nothing on this question, but have in cases where the question has been presented, followed rules that have been laid down in other states.

In Georgia, in the case of *Mullins v DuVall*, the court stated

"Where one physician or surgeon sends another as his substitute to treat or perform an operation upon a patient and the services of the substitute are accepted, the patient will be presumed to have reposed confidence in the professional capacity of the substitute, not as an agent but as the principal, and will be taken to have relied upon him as a physician to exercise his own knowledge, skill and discretion."

It will be noted that this authority clearly distinguishes the services rendered by the substitute as the services not of an agent but of a principal. The substitute, therefore, under this authority is not deemed to be acting as the agent of the physician but as an independent principal, or what we call an independent contractor. The question naturally arises as to what care should be taken by the physician sending the substitute in the selection of such substitute and the rule in this regard is that he must act in good faith and with reasonable care in the selection of a substitute. This is simply another way of stating that he should not knowingly or negligently

send as a substitute an incompetent man. In that event, it was held in a case in Ohio that the physician so sending the substitute could not be held liable in damage for any want of skill or malpractice on the part of a physician or surgeon employed. In these cases it must be assumed that the patient became liable for the services rendered to the physician who rendered the services.

In a case in Michigan the court stated

"If a family doctor or railway surgeon on leaving town recommends, in case of need, some other physician who is not however in any sense in his employment, it does not make him liable for injuries resulting from the latter's want of skill in case he should be employed."

And in a case cited in the state of Arkansas the court said

"A surgeon who, on being called upon to treat a patient, informed him that he would be absent for two weeks, and that another surgeon named would attend to his cases in his absence, will not be responsible for the latter's negligence or want of skill in treating the patient during such absence, if there was no business relation between the two surgeons."

Attention should be called to the condition imposed in the latter opinion and in fact in all the opinions cited above of the absence of the business relationship between the two surgeons. This condition is simply a statement of the absence of the relation of principal and agent between the two, because the general rule of law applicable in negligence cases is that the principal is liable for the negligence of his agent when that negligence results in damage when the agent is engaged in his principal's business.

In a case decided in the state of New Jersey it appeared that one M, a practicing physician, promised H to attend his wife at her confinement. M made an examination of her and advised that he would not be needed for several days and then left town for a vacation. While absent H called M's office and a third party, Dr P responded, as Dr P was taking care of M's patients while M was away. Dr P delivered the child, but in so doing cut the cord too short and the child died from umbilical hemorrhage. The patient, because of the child's death, suffered a nervous shock. The plaintiff H sued to recover for loss of his wife's services and expenses incurred because of her nervous

condition. In reversing a verdict in favor of plaintiff the court said:

"Dr P and the defendant were each of them, practicing physicians of this state, having no business connections with one another, except Dr P was attending the practice of the latter while he was temporarily absent. Even if it be admitted, therefore, that Dr P was employed by the defendant to attend upon the wife of the plaintiff, that fact did not render the defendant liable for his neglect or want of skill in the performance of this service, for an examination of the authorities will show that a party who employs a person following a distinct and independent occupation of his own, is not

responsible for the negligent or improper acts of the other."

It will be noted that in this case also the application of the principle of independent contractor to the physician acting as a substitute is predicated upon the absence of business relationship between the two physicians. In other words, the court does not change the rule with respect to the responsibility of the principal for the acts of his agent but clearly shows that that principle does not apply to a case where a physician leaves his patients in charge of another who he has reasonable ground to believe is competent, careful and skillful, and whose services are accepted by the patient, and upon whose skill, competency and care the patient relies. G W W

### CLAIMED IMPROPER PRESCRIBING OF TANNIGEN FOR CHILD SUFFERING FROM DIARRHŒA.

On September 10th a general practitioner was called to attend an infant about one and a half years of age. A careful general examination was made, disclosing an undernourished, underfed anæmic and marasmatic infant with a subnormal temperature. The child was also suffering from a stomatitis.

The physician immediately advised the mother to have the child taken to the hospital, where it could receive the proper care and attention, as it was its only chance of life. Thus the mother refused to do. He then prescribed a tonic of syrup of hypophosphates and placed the child upon a diet of beef juice and modified milk. Instructions were given that the medication be given to the child regularly and that if no improvement was shown in a few days to notify the physician.

On September 12th, the mother telephoned the physician asking advice and stating that the child had not improved. The physician was not requested to call at this time. He again advised hospital care.

On September 16th the physician was again called to the patient's home. At this time the diarrhœa with which the child was afflicted was more aggravated. Proper advice as to the washing out of the bowels was given and a prescription of tannigen was given to control the diarrhœa and a proper quantity of whisky as a stimulant. A physical examination on this day disclosed the same condition as on the preceding examination with a sub-normal temperature. He ordered barley water to be substituted for milk for twenty-four hours and again advised that the child be taken to the hospital, cautioning the mother that it was the child's only chance of life. She responded that if the child was to die that she would rather have it die at home.

On September 17th the father telephoned the physician, stating the child was worse. He also was told to have the child taken to the hospital

and was requested to call the physician back. In the meantime the physician had arranged for the reception of the child at one of the best hospitals in the city. However nothing further was heard from the parents.

The home conditions were unsanitary and dirty, the nipples and bottles were likewise dirty and the mother in the same condition, and flies were swarming over the milk and the child. When first seen by the physician, a very warm day the child was in a carriage covered with blankets, a cap on its head and stockings on its feet.

On October 2nd the child died on the death certificate the cause of death being given as enterocolitis, contributory cause convulsions. This certificate also showed that the physician who made the same had attended the child from September 25th, so that apparently between the defendant's last treatment on September 16th and September 25th the child was without any medical attention.

Suit was instituted against the first physician who attended the child, charging that on September 16th the defendant was engaged to treat the child for summer complaint and ordinary children's complaints and that the tannigen prescribed by the defendant on that day was a highly dangerous drug and was improperly prescribed and caused the death of the infant. Coincident with the suit instituted against the physician was one instituted against the druggist who filled the prescription, and in that suit it was charged that the druggist improperly filled the prescription which the physician had prescribed.

The plaintiff's attorney made numerous unsuccessful attempts to procure a settlement of the action and when he found that his efforts were fruitless, upon the day that the case was called for trial he abandoned his action, and the complaint against the physician was dismissed.

# LEGISLATION

By James N Vander Veer, M.D

## NOTICE TO THE CHAIRMEN OF THE COUNTY LEGISLATIVE COMMITTEES

A joint meeting of the Chairmen of the County Legislative Committees and of the officers of the Medical Society of the State of New York will be held in the Hotel Ten Eyck, Albany, N Y, on Wednesday, March 19th, 1924, at 12 o'clock, noon

A hearing on the Education Department Bill, Senate Introductory No 637 (The Practice of Medicine Act), will be held on Wednesday, March 19th, 1924, at 2 o'clock, before the Senate Committee on Public Health and the Assembly Committee on Ways and Means

## LEGISLATIVE BILLS.

### SENATE

In Re State Institute for the Study of Malignant Disease at Buffalo, N Y—Senate Int No 175 (Print No S 175), by Senator Michael E Reburn of New York, concurrent Assembly Int No 195 (Print No A 195), by Assemblyman Julius Berg of Bronx County, which would amend section 345, Public Health Law, by placing fiscal control of State Institute for Study of Malignant Disease with State Department of Health

The bill, which was referred to the Public Health Committee in each house, is still in Committee

The Narcotic Bill—Senate Int No 285 (Print No S 289), by Senator Morton J Kennedy of New York, concurrent Assembly Int No 342 (Print No A 342), by Assemblyman Morris Weinfeld of New York, is still in committee

Comment It is hoped that the proposed new bill emanating from the recent conference has been introduced before this Journal reaches you, and that we have had opportunity and space to print the bill in full for your perusal in this issue of the Journal

If such is the case, we would ask your perusal of the bill, as one or two minor changes may be added which are in no wise detrimental to the theory as now propounded relative to the narcotic question

In Re Appointing an Eye and Ear Specialist to Assist the Medical Inspector of Schools—Senate Int No 317 (Print No S 321), by Senator Benjamin Antin of New York, concurrent Assembly Int No 370 (Print No A 372), by Assemblyman Frederic S Cole of Herkimer County, is still in committee

A hearing has been called for March 11, at which your Chairman will appear

In Re Distribution of Information Concerning Results of Scientific Study—Senate Int No 436 (Print No S 445), by Senator Michael E Reburn of New York, concurrent Assembly Int No 588 (Print No A 592), by Assemblyman Joseph Gavagan of New York, referred to Judiciary Committee in each house Still in committee

The Child Experimentation Bill—Senate Int No 584 (Print No S 608), by Senator John P Ryan of Rensselaer County, no concurrent Assembly bill has as yet appeared Still in Senate Codes Committee

Comment Your Legislative Bureau would request the County Legislative Chairmen to report whether they have had any results from letters sent to the legislators

The Anti-Vivisection Bill—Senate Int No 588 (Print No S 612), by Senator John P Ryan of Rensselaer County, concurrent Assembly Int No 1094 (Print No 1180), by Assemblyman Samuel Mandelbaum of New York Still in Senate Codes Committee, and in Assembly Codes Committee

Comment Your Legislative Bureau would request the County Legislative Chairmen to report whether they have had any results from letters sent to the legislators

The State Department of Education Bill to Amend the Medical Practice Act—Senate Int No 637 (Print No S 663), by Senator Daniel J Carroll of Kings County, concurrent Assembly Int No 888 (Print No A 927), by Assemblyman Frank H Lattin of Orleans County, still in Senate Public Health Committee, and in Assembly Committee on Ways and Means

Comment To date the Counties have reported as follows

Counties in favor of Bill Albany, Cayuga, Chemung, Dutchess-Putnam, Essex (no vote), Franklin (no vote), Greene, Jefferson, Monroe, Montgomery, Oneida, Onondaga, Ontario, Orleans, Richmond, Rockland, St. Lawrence (no vote), Saratoga, Schoharie, Schuyler, Seneca, Suffolk, Sullivan, Tompkins, Washington, Wayne, Westchester, Yates, Bronx

Counties opposed to Bill Allegany, Broome, Erie, Fulton (any bill requiring registration), Genesee, Kings, Livingston, Madison (no vote), Nassau (no vote), Orange, Queens, Rensselaer (any bill requiring registration), Schenectady, Ulster

Counties not heard from Cattaraugus, Chautauqua, Chenango, Columbia, Cortland, Delaware, Herkimer, Lewis, New York, Oswego, Otsego, Steuben, Tioga, Wyoming, Clinton, Niagara.

---

Workmen's Compensation Law, in Regard to Occupational Diseases—Senate Int. No 700 (Print No S 740), by Senator Jeremiah F Twomey of Kings County, concurrent Assembly Int. No 836 (Print No A 862, 1112), by Assemblyman Frank Wilson of Albany County

The bill was reported February 25, amended and recommitteed, and now appears under the new Senate Print No 919

No comments having been received from physicians or from County Societies, the bill will be dropped.

---

In Re Practice of Chiropody and Podiatry—Senate Int No 738 (Print No S 781), by Senator William Byrne of Albany County, concurrent Assembly Int No 507 (Print No 950), by Assemblyman Paul T Kammerer of New York.

Comment At the hearing held on the bill it was amended and the physicians of the State are now in accord with the measure

See concurrent Assembly Int No 507 (Print No A. 509, 950), for amendment.

---

In Re Abolishing the Office of Coroner in Westchester County—Senate Int. No 830 (Print No 885), by Senator Walter Westall of Westchester County, concurrent Assembly Int No 1106 (Print No A 1192), by Assemblyman Herbert Shonk of Westchester County, will be dropped Still in committee.

## NEW SENATE BILLS SINCE LAST WEEK BEGIN HERE

In Re Incorporation, Maintenance, etc., of Hospitals, Infirmeries, Dispensaries, etc.—Senate Int No 892 (Print No S 962), by Senator Ellwood M Rabenold of New York, which bill has been referred to the Senate Judiciary Committee, is printed here in full for the information of the profession

Int 892

IN SENATE,

February 26 1924

Introduced by Mr Rabenold—read twice and ordered printed, and when printed to be committed to the Committee on the Judiciary

### AN ACT\*

To amend the membership corporations law in relation to incorporation or extension of corporate purposes for establishment and maintenance of hospitals infirmeries dispensaries and homes for invalids or the aged or indigent.

*The People of the State of New York represented in Senate and Assembly do enact as follows*

Section 1 Sections four and forty of chapter forty of the laws of nineteen hundred and nine entitled "An act relating to membership corporations, constituting chapter thirty-five of the consolidated laws," are hereby amended to read as follows

§ 4 Extension of corporate purposes by supplemental certificate. A membership corporation, created under or by a general or special law for purposes for which a corporation may be created under any article of this chapter may, from time to time, extend its corporate purposes so as to include any other purpose for which a corporation may be created under such article by filing in the offices in which its original certificates of incorporation if any are filed, or otherwise in the offices in which original certificates of incorporation for such purposes are required to be filed, a copy of a resolution in favor of such extension, certified by the president and secretary of the corporation to have been duly adopted by the concurring vote of a majority of the members of the corporation present at an annual meeting, or a special meeting duly called for that purpose, and a certificate signed and acknowledged by a majority of the directors of the corporation, in pursuance of such resolution, with the approval, indorsed thereupon or annexed thereto, of a justice of the supreme court, and if the care of orphan, pauper or destitute children, or the establishment and maintenance of a hospital, infirmary, dispensary, home for invalids aged or indigent persons, be included among such corporate pur-

EXPLANATION—Matter in italics is new; matter in [ ] is old law to be omitted.

poses, with the additional approval, indorsed thereupon or annexed thereto, of the state board of charities

§ 40 Purposes for which corporations may be formed under this article A membership corporation may be created under this article for the purpose of erecting, establishing and maintaining a hospital, infirmary, dispensary, home for invalids, aged or indigent persons, or for any other lawful purpose, except a purpose, for which a corporation may be created under any other article of this chapter, or any other general law than this chapter

§ 2 Section forty-one of such chapter, as last amended by chapter one hundred and eighty-eight of the laws of nineteen hundred and twenty-three, is hereby amended to read as follows

§ 41 Certificates of incorporation Five or more persons may become a membership corporation for any one of the purposes for which a corporation may be formed under this article or for any two or more of such purposes of a kindred nature, by making, acknowledging and filing a certificate, stating the particular objects for which the corporation is to be formed, each of which must be such as is authorized by this article, the name of the proposed corporation, the territory in which its operations are to be principally conducted, the town, village or city in which its principal office is to be located, [if it be then practicable to fix such location], the number of its directors, not less than three nor more than [one hundred] *forty-eight*, and the names and places of residence of the persons to be its directors until its first annual meeting *The certificate of incorporation of a hospital or dispensary may also specify the qualifications of members of the corporation with respect to their adherence or non-adherence to a particular school or theory of medical or surgical treatment, and the systems of medical practice or treatment to be used in such hospital or dispensary* Such certificate shall not be filed without the written approval, indorsed thereupon or annexed thereto, of a justice of the supreme court If such certificate specify among such purposes the care of orphan, pauper or destitute children, the establishment or maintenance of a [maternity] hospital, *infirmary, dispensary, home for invalids, aged or indigent persons, or lying-in asylum* where women may be received, cared for or treated during pregnancy or during or after delivery, or for boarding or keeping nursing children, the written approval of the state board of charities shall also be indorsed thereupon or annexed thereto, before the filing thereof On filing such certificate, in pursuance of law, the signers thereof, their associates and successors, shall be a corporation in accordance with the provisions of such certificate Any corporation heretofore or hereafter organized under this

article for the purpose of gathering, obtaining and procuring information and intelligence, telegraphic or otherwise, for the use and benefit of its members, and to furnish and supply the same to its members for publication in newspapers owned or represented by them may admit as members thereof, other corporations, limited liability companies, joint stock or other associations, partnerships and individuals engaged in the same business or in the publication of newspapers, periodicals or other publications, upon such terms and conditions, not inconsistent with law or with its certificate of incorporation, as may be prescribed in its by-laws

§ 3 Article seven of such chapter is hereby repealed

§ 4 This act shall take effect immediately  
Comment Comment on the bill is invited from members of attending staffs of any institution to whose especial attention we wish to call this amendment

Requiring Iron Stairways on Outside of Sanitariums, etc.—Senate Int No 894 (Print No S 964), by Senator Mortimer Y Ferris of Ticonderoga, concurrent Assembly Int No 1212 (Print No A 1335), by Assemblyman Ralph H Loomis of Delaware County, referred to Public Health Committee in each house, is printed here in full for the information of the profession

STATE OF NEW YORK

No 964

Int 894

IN SENATE,

February 26, 1924

Introduced by Mr Ferris—read twice and ordered printed, and when printed to be committed to the Committee on Public Health

AN ACT\*

To amend the public health law, in relation to iron stairways on outside of hospital, sanitarium and certain other buildings

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section three hundred and thirty-four of chapter forty-nine of the laws of nineteen hundred and nine, entitled "An Act in relation to the public health, constituting chapter forty-five of the consolidated laws," is hereby amended to read as follows

§ 334 Iron stairways on outside of hospital, *sanitarium and certain other buildings* All hospital buildings used for general hospital purposes, or hospitals or asylums for the insane, or any hospital buildings *or buildings maintained, operated or used for the purpose of a sanatorium or*

\* EXPLANATION—Matter in italics is new, matter in brackets [ ] is old law to be omitted

a sanitarium, or for boarding or lodging house purposes where three or more persons suffering from or afflicted with or convalescing from any disease or ailment are habitually kept, boarded or housed for hire, which are more than two stories high, other than those which are fireproof in their construction, shall have properly constructed iron stairways on the outside thereof, with suitable doorways leading thereto from each story above the first [, for use in case of fire] It shall be the duty of the trustees, managers, owners [or] proprietors and lessees of such [hospitals or asylums] building to cause such stairways to be constructed and maintained. If the trustees [or], managers, owners, proprietors and lessees of any [hospital as herein described] of the buildings herein described, except those owned and maintained by a city, a county [,] or the state, shall fail to provide such stairways [before the first day of October, eighteen hundred and ninety six] after this section or hereby amended takes effect, then the local authorities shall proceed to erect such stairways and the cost thereof may be recovered by an action at law from the [property of said hospital] trustees, managers owners, proprietors or lessees of such buildings

The district attorney of each county is hereby charged with the execution of this statute, except in the case of [hospitals] buildings erected or maintained by the state, city or by a county

The provisions of this section shall not apply to any [institution] of the buildings above described in any of the cities or counties of this state, which the fire department of said city or where situated outside of a city the district attorney of the county shall certify in writing to be fireproof to an extent which will not require the appliances and fixtures provided for in this section. The certificate exempting [institutions] such buildings from the operation[s] of this section shall be filed during the month of January in each year[,] in the office of the county clerk of the county

*The maintenance, operation or use of any of the buildings above described by the owner, board of managers or other governing body, in violation of this section, shall in addition constitute a misdemeanor punishable by a fine of not exceeding five hundred dollars or by imprisonment of not more than one year or both.*

§ 2 This act shall take effect May first, nineteen hundred and twenty-four

No comment except to call the attention of members who are concerned as boards of managers of institutions, or physicians who are attending men at same

IN SENATE

February 27 1924

Introduced by Mr Whitley—read twice and ordered printed and when printed to be committed to the Committee on Codes

#### AN ACT\*

To amend the code of criminal procedure, in relation to disorderly persons

*The People of the State of New York represented in Senate and Assembly do enact as follows*

Section 1 Section eight hundred and ninety-nine of the code of criminal procedure is hereby amended by adding thereto a new subdivision, to be subdivision ten, to read as follows

10 Persons who are addicted to the habitual use of cocaine or opium, or the derivatives of cocaine or opium, or of any other habit-forming drug, except as administered, prescribed or dispensed by a duly licensed physician

§ 2 Sections nine hundred and one and nine hundred and three of the code of criminal procedure are hereby amended to read as follows

§ 901 On confession or proof that he is a disorderly person punishment or security to be required

If the magistrate be satisfied from the confession of the defendant or by competent testimony, that he is a disorderly person, he may require that the person charged give security by a written undertaking, with one or more sureties approved by the magistrate, to the following effect

1 If he be a person described in the first or second subdivision of section eight hundred and ninety nine that he will pay to the county super-

\*EXPLANATION—Matter in *italics* is new; matter in brackets [ ] is old law to be omitted

intendent of the poor or to the overseer of the poor of the town, city or village, or to a society for the prevention of cruelty to children, weekly for the space of one year thereafter, a reasonable sum of money to be specified by the magistrate for the support of his wife or children,

2 In all other cases, except as provided in subdivisions three and four of this section, that he will be of good behavior for the space of one year,

Or that the sureties will pay the sum mentioned in the undertaking, and which must be fixed by the magistrate

3 All persons described in subdivision three of section eight hundred and ninety-nine shall be liable, upon conviction, to a fine not to exceed two hundred and fifty dollars, or to imprisonment not to exceed six months, or to both such fine and imprisonment

4 *All persons described in subdivision ten of section eight hundred and ninety-nine shall be liable, upon conviction, to imprisonment not exceeding six months*

§ 903 Certificate to constitute record of conviction, and to be filed, commitment thereon, probation

The magistrate must immediately cause the certificate, which constitutes the record of conviction, to be filed in the office of the clerk of the county, and must, by a warrant signed by him with his name of office, commit the defendant to the county jail, or in the city of New York, to the city prison or penitentiary of that city, or in the county of Monroe, to the penitentiary of that county, or in the county of Westchester to the penitentiary and workhouse of that county, for not exceeding six months at hard labor, or until he gives the security prescribed in section nine hundred and one, or, if the defendant be a person described in the first or second subdivision of section eight hundred and ninety-nine, the magistrate may require him while on probation to pay through the probation officer weekly a reasonable sum for the support of his wife or children, *or if the defendant be a person described in subdivision ten of section eight hundred and ninety-nine, whenever the chief medical officer of the institution to which the said defendant has been committed shall certify to the committing magistrate or court that the said defendant has been sufficiently treated, or give any other reason which is deemed by the magistrate or court to be adequate and sufficient, he or it may discharge the person so committed or parole such person to report to the local health officer at such dates or times as he may require, or return such person to await the further commands of the court, provided, however, that when such commitment is to an institution under the jurisdiction of a department of correction or*

*other similar department in a city where there is a parole commission established pursuant to law, such commission shall act in the place and stead of a chief medical officer for the purpose of making such a certificate*

§ 3 This act shall take effect immediately.

Comment No comment at present until your Committee on Legislation has had an opportunity to review the bill

## AN ACT

To amend the poor law, in relation to tubercular poor

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Article four of chapter forty-six of the laws of nineteen hundred and nine, entitled "An act in relation to the poor, constituting chapter forty-two of the consolidated laws," is hereby amended by adding a new section, to be section fifty-nine, to read as follows

§ 59 Restriction on settlements in certain counties Notwithstanding any provision of this article, a person who shall have become a resident of any town in the county of Franklin, Essex or Sullivan, while afflicted with tuberculosis, shall not, nor shall any member of his family, be deemed settled in such town until he shall have been a resident and inhabitant of such town for five years, but if such a settlement be gained, he, and such members of his family, shall so remain until he shall have gained a settlement by residence for five years in another town of the same county, or for one year in a town or city elsewhere, or shall remove from this state and remain therefrom one year, nor shall such person be deemed settled in such county, so as to become a county poor person, unless and until he shall have resided in one or more of the towns of such county for five years in the aggregate. Such a person shall be deemed settled in, and subject to support by the town or county of the state whence he came before becoming a resident of the county of Franklin, Essex or Sullivan as the case may be, or if he shall have come to such county from without the state before gaining a settlement elsewhere within the state, he shall be deemed a state poor person within the meaning and subject to the provisions of section ninety of this chapter. Support of such poor person by the town or county from whence he came may be enforced by the county of Franklin, Essex or Sullivan, as the case may be, in the manner provided by this article

AN ACT\*

To amend the education law in relation to instruction in physical training in certain schools

*The People of the State of New York represented in Senate and Assembly do enact as follows*

Section 1 Section six hundred and ninety-five of chapter twenty-one of the laws of nineteen hundred and nine entitled "An act relating to education, constituting chapter sixteen of the consolidated laws," as amended by chapter one hundred and forty of the laws of nineteen hundred and ten, such section having been added by chapter five hundred and sixty seven of the laws of nineteen hundred and sixteen and last amended by chapter three hundred and eighty-nine of the laws of nineteen hundred and twenty-one, is hereby amended to read as follows

§ 695 Instruction in physical training and kindred subjects [All male and female pupils above the age of eight years in all [elementary and secondary] schools of every school district in a city and every union free school district regularly employing twenty or more teachers, shall receive as part of the prescribed courses of instruction therein such physical training under the direction of the commissioner of education as the regents may determine, during periods which shall average at least twenty minutes in each school day Pupils above such age attending [the] such public schools shall be required to attend upon such prescribed courses of instruction

The board of education or trustees of every [school district in a city and every union free school district regularly employing twenty or more teachers] such school shall employ a teacher or teachers qualified and duly licensed under the regulations of the regents to give such instruction [, in every other district of the state, they shall require such instruction to be given by the teacher or teachers regularly employed to give instruction in other subjects or by a teacher or teachers qualified and duly licensed under the regulations of the regents The boards of education or trustees of two or more contiguous districts in the same supervisory district, however, may join in the employment of a teacher qualified and duly licensed under the regulations of the regents to give such instructions, and the salary of such teacher and the expenses incurred on account of such instruction shall be apportioned by the district superintendent among such

districts according to the assessed valuation thereof, and is so apportioned shall be a charge upon each of such districts] Similar courses of instruction shall be prescribed and maintained in private schools in the state, and all pupils in such schools over eight years of age shall attend upon such courses and if such courses are not so established and maintained in any private school, attendance upon instruction in such school shall not be deemed substantially equivalent to instruction given to children of like ages in the public school or schools of the city or district in which the child resides

§ 2 This act shall take effect immediately

No Scholarship Shall Include Instruction in Any Profession, Admission to Practice of Which Shall Require a License from State—Assembly Int No 1188 (Print No A 1298), by Assemblyman Guernsey T Cross of Sullivan County, referred to Public Education Committee is printed here in full for the information of the profession

STATE OF NEW YORK

No 1298

Int 1188.

IN ASSEMBLY

February 26 1924

Introduced by Mr Cross—read once and referred to the Committee on Public Education

AN ACT\*

To amend the education law in relation to scholarships.

*The People of the State of New York represented in Senate and Assembly do enact as follows*

Section 1 Section seventy seven of chapter twenty-one of the laws of nineteen hundred and nine, entitled "An act relating to education constituting chapter sixteen of the consolidated laws," as amended by chapter one hundred and forty of the laws of nineteen hundred and ten, such section having been added by chapter two hundred and ninety two of the laws of nineteen hundred and thirteen, and amended by chapter seven hundred and fourteen of the laws of nineteen hundred and twenty-three, is hereby amended to read as follows

§ 77 Limitation as to number of scholarships courses of study At no time shall there be more than twenty scholarships established and maintained for each assembly district and at no time shall there be more than three thousand such scholarships so established and maintained for the entire state not including scholarships maintained from the revenues or income of trust funds, or gifts, devises or bequests created or made as provided in this act for the maintenance of such scholarships A person entitled to such scholarships shall not be restricted as to the choice of the college which he desires to attend, or the

\* EXPLANATION—Matter in *italics* is new; matter in brackets [ ] is old law to be omitted.

\* EXPLANATION—Matter in *italics* is new matter in brackets [ ] is old law to be omitted.

course of study which he proposes to pursue, provided that no such scholarship shall include professional instruction in theology, [or in any profession, admission to the practice of which shall require a license from the state] or in any graduate courses following the receiving of a bachelor's degree, and provided further, that the college selected by the person entitled to such scholarship is situated within the state of New York, and is incorporated as a college and authorized under the laws of this state and the rules of the regents of the university to confer degrees

§ 2 This act shall take effect immediately

Requiring Iron Stairways on Outside of Sanitariums, etc.—Assembly Int No 1212 (Print No A 1335), by Assemblyman Ralph H Loomis of Delaware County, concurrent Senate Int No 894 (Print No S 964), by Senator Morton Y Ferris of Ticonderoga, referred to Public Health Committee in each house

See concurrent Senate Int No 894, for printed bill and comment

## ACTION ON BILLS

Assembly Int No 309, in re nursing and first aid services in factories, amended and recommitted

Page 2, line 1, after the word "in" insert "or near"

Senate Int No 317, eye and ear specialist to assist medical inspector of schools

Recommitted on February 25

## HEARINGS

March 4 at 2 p m—Assembly Int No 277, amending Workmen's Compensation Law, reducing the non-compensated waiting period

March 5 at 10 a m—Assembly Int No 542, in re violations of orders of local health boards

March 11 at 2 p m—Senate Int No 317, eye and ear specialist to assist the medical inspector of schools.

## SUGGESTED AMENDMENTS TO THE WEINFELD NARCOTIC BILL.

The following is the suggested bill for the control of narcotic drug addiction, as well as the control of narcotics in their distribution, sale, etc., as drafted by Prof J P Chamberlain of Columbia University, Stephen P Anderton, Esq, Chairman Committee on Legislation of the New York State Bar Association, and Dr Carleton Simon, Special Deputy Police Commissioner of New York City, which committee was suggested at the conference held with the Commissioner of Health on February 21

The bill has been submitted to your Committee on Legislation, and Dr Vander Veer has suggested that Section 442, Subsection 4-b, is rather too broad, giving to the Commissioner of Health a wider latitude in the matter of laboratories than was intended, and has so consulted with the Commissioner of Health

Dr Frank D Jennings of the Committee on Legislation in his consideration of the bill has brought forth this point

Section 424, paragraph 3, relative to possession lawful In the last line he believes the phrase "in an amount necessary therefor" is rather indefinite, and tritely asks, "Who determines that amount?" Inasmuch as if it is left to some local authority, he may consider

one tube of hypodermic tablets to be too much, and again he calls attention to Section 442, Subsection 4-b, making the same criticism that Dr Vander Veer has offered, but passing the remark that the bill is much improved in this draft

Dr George R Critchlow, the other member of the Committee on Legislation, in his consideration of the bill, believes the bill to be much improved, but asks if novocaine by any chance can be included in the context of Section 421, subdivision 10, under the heading of coca leaves, and further records his opposition to any inclusion in the bill of any provisions for compulsory commitment of all addicts to an institution

The bill as redrafted has not been forwarded to the Council of the State Society, as the time is too short for much preliminary debate on the question, and the Committee on Legislation would ask pardon of some who heretofore have been consulted, when time is given, before publishing to the Society

The bill is being submitted to the counsel for the State Society and it is hoped that he will have had time to peruse the same and offer his criticisms or suggestions in this issue of the Journal

J N V V

## WEINFELD BILL

420 Short title This article shall be known as the narcotic drug control law

421 Definitions As used in this article

1 "Person" includes any corporation, association, copartnership or one or more individuals

2 "Physicians" means a licensed practitioner of medicine as defined by article eight of this chapter

3 "Apothecary" means a licensed pharmacist or druggist as defined by article eleven of this chapter

4 "Dentist" means a licensed practitioner of dentistry as defined by article nine of this chapter

5 "Veterinarian" means a licensed practitioner of veterinary medicine as defined by article ten of this chapter

6 "Medicine" means a drug or preparation of drugs in suitable form for use as a remedial or curative substance

7 "Sale" includes barter, exchange or giving away, or offering therefor, and each such transaction made by any person whether as principal, proprietor, agent, servant or employee

8 "Dispense" includes distribute, leave with, give away, dispose of, and deliver to a person or to his agent to be delivered by him

9 "Administer" means only administration by a person authorized to administer habit-forming drugs

10 "Coca leaves" includes coca leaves, cocaine, or any compound, manufacture, salt, derivative or preparation thereof including alpha or beta cocaine, or any of their salts or any synthetic substitute of any of them, identical in chemical composition but shall not include decocanized coca leaves or preparations made therefrom or other preparations of coca leaves which do not contain cocaine

11 "Opium" includes opium, morphine, codeine, diacetyl morphine (heroin) or any compound, manufacture, salt, derivative or preparation of any of them or any synthetic substitute or any of them identical in chemical composition, but not apomorphine and its salts

12 "Cannabis indica" or "cannabis sativa" shall include any compound, manufacture, salt, derivative or preparation thereof and any synthetic substitute of any of them identical in chemical composition

13 "Habit-forming drugs" shall mean coca leaves, opium, cannabis indica or cannabis sativa

14 "Manufacturer" means a person who by compounding, mixing, or other process of manufacture, produces or prepares habit-forming drugs for sale on written orders and does not include an apothecary who compounds habit-forming drugs to be sold or dispensed on prescription

15 "Wholesaler" means a person who supplies habit-forming drugs on written orders

16 "The Harrison Act" means the act of Congress, entitled "An act to provide for the registration of, with collectors of internal revenue, and to impose a special tax upon all persons who produce import manufacture, compound deal in, dispense, sell, distribute, or give away opium or coca leaves, their salts, derivatives or preparations and for other purposes," approved December 17, 1914, as heretofore or hereafter amended

§422 Acts dangerous to public health Any unauthorized possession, control over, sale, distribution, prescribing, administering or dispensing of habit-forming drugs is hereby declared to be dangerous to the public health, and a menace to the public welfare

§423 Acts prohibited It shall be unlawful for any person to possess, have under his control, sell, distribute, administer, dispense, or prescribe any habit-forming drug except as provided in this article

§424 Sale on written orders 1 By whom and to whom sold A manufacturer, wholesaler, or apothecary may sell or distribute habit-forming drugs only to any of the following persons and upon his written order

a To a manufacturer, wholesaler or apothecary

b To a physician, dentist or veterinarian

c To a public or private hospital

d To a hospital or institution licensed for the treatment of drug addiction

e To a person in charge of a laboratory where habit-forming drugs are used for scientific or medical research, but only for use in such laboratory

f To a person in the employ of the United States or of this state or of any political subdivision thereof purchasing or receiving the drug by reason of his official duties

g To a captain or proper officer of a ship upon which no regular physician is employed, for the actual medical needs of the officers and crew when not in port

Provided, however, that both parties to the transaction in each of the above cases are registered under the Harrison Act if required by such act to be so registered

2 Order blanks a A written order for the supply of any habit-forming drug shall be signed in duplicate by the person giving it or by his duly authorized agent, one duplicate of which shall be presented to the person who sells or distributes such habit-forming drug and in the event of his acceptance of such order, each party shall preserve his duplicate of such order for a period of two years in such a way as to be readily accessible for inspection and it shall be subject to inspection by any public officer or employee engaged in the enforcement of this article. Provided, however, that it shall be deemed a compliance with this sub-section if the person giving the order shall have complied with the provisions of the Harrison Act respecting the requirements governing order blanks under said act

3 Possession unlawful Possession or control over habit-forming drugs obtained as provided in this section, shall be lawful if in the regular course of business, occupation, profession, employment, or duty of the possession and in an amount necessary therefor

4 This section shall not apply to the supply of habit forming drugs on prescription or administered or dispensed by a physician, dentist, or veterinarian

§425 Preparations and remedies exempted The provisions of this article shall not apply to preparations or remedies which do not contain more than two grains of opium, or more than one-fourth of a grain of morphine, or more than one-eighth of a grain of heroin, or more than one grain of codeine, or any salt or derivative of any of them in one fluid ounce, or, if a solid or semi-solid preparation, in one avoirdupois ounce, or to liniments, ointments, or other preparations which are prepared for external use only, except liniments, ointments, and other preparations which contain cocaine or any of its salts or alpha or beta cocaine or any of their salts or any synthetic substitute identical in chemical composition, provided that such remedies and preparations are sold, distributed, dispensed, or possessed as medicines and not for the purpose of evading the intentions and provisions of this article

§426 Professional use of habit-forming drugs 1 Veterinarians A veterinarian may prescribe, administer or dispense habit-forming drugs in good faith and in the course of his professional practice only and not for use by a human being

2 Dentists A dentist, in good faith and in the course of his professional practice only, may administer or dispense habit-forming drugs to patients under his immediate treatment

3 Physicians A physician, in good faith and in the course of his professional practice only, may prescribe, administer, or dispense habit-forming drugs

§427 Prescriptions Any apothecary may

sell or dispense habit-forming drugs to any individual upon a written prescription of a physician or veterinarian, dated and signed on the day when issued and bearing the full name and address of the patient and the name, address and registry number of the practitioner under the Harrison Act if he is required by it to be so registered. The person filling the prescription must write the date of filling and his own signature upon the face of the prescription, and the prescription must be retained on file by the apothecary filling it for two years so as to be readily accessible for inspection and it shall be subject to inspection by any public officer or employee engaged in the enforcement of this article. The prescription shall not be refilled

§428 Record to be kept 1 Physicians, dentists, veterinarians Every physician, dentist and veterinarian shall keep a record of all habit-forming drugs administered or dispensed by him (except such as may be administered or dispensed to a patient upon whom he shall personally attend), showing the amount administered or dispensed

2 Manufacturers and wholesalers shall keep a record of the habit-forming drugs received and dispensed of by them

3 Exempted preparations and remedies Every manufacturer of exempted preparations or remedies shall keep a record of the amount of habit-forming drugs received and of all sales of exempted preparations or remedies and every dealer therein shall keep a record of all sales of exempted preparations and remedies

4 Form and preservation Every such record shall be kept for a period of two years from the date of the transaction recorded, and a record required by or under the Harrison Act, containing substantially the same information, shall be a compliance with this section. All records required by section shall be readily accessible for inspection and shall be open to inspection by the proper authorities

§429 Labels Whenever an apothecary pursuant to a written prescription shall sell or dispense habit-forming drugs or whenever a physician, dentist or veterinarian shall dispense any of such drugs, he shall securely affix to the container of such drug a label stating in legible English the name and address of the physician or veterinarian prescribing or dispensing and of the apothecary or dentist dispensing, the date and the name and address of the person for whom or the owner of the animal for which the drug is dispensed

§430 Authorized possession of drugs by individual A person to whom or for whose use any habit-forming drug has been sold or dispensed by an apothecary, physician or dentist, or the owner of an animal for which any such

drug has been prescribed or dispensed by a veterinarian, may lawfully possess it in the container delivered to him by the person selling or dispensing same.

**§431 Physical examination required** A physician, dentist or veterinarian shall not administer, dispense or prescribe any habit-forming drug except after a physical examination of the person for whom or the animal for which the drug is intended

**§432 Instruments for injection of habit-forming drugs** No person except a manufacturer or a wholesale or retail dealer in surgical instruments, apothecary, physician, dentist, veterinarian, nurse or interne shall at any time have or possess a hypodermic syringe or needle or any instrument or implement adapted for the use of habit-forming drugs by subcutaneous injections and which is possessed for the periods of administering habit-forming drugs unless such possession be authorized by the certificate of a physician issued within the period of one year prior thereto

**§433 Exemption from restrictions** 1 Common carriers, employees, public officers The provisions of this article restricting the possessing or having under control of habit-forming drugs shall not apply to common carriers or warehousemen or their employees engaged in lawful transportation or storage of such drugs nor to public officers or employees while engaged in the performance of their official duties, nor to temporary incidental possession by employees or agents of persons lawfully entitled to possession, or by persons whose possession is for the purpose of aiding public officers in the performance of their official duties

2. Interstate commerce. This article shall not apply to acts done, or to habit-forming drugs possessed in the course of interstate or foreign commerce

**§434 Drugs delivered to the state hospital commission** All drugs which have been seized and judicially determined to have been unlawfully possessed or the title to which has ceased and which have come into the hands of a peace officer shall upon the direction of a court or magistrate, be delivered to the state hospital commission unless destroyed according to law or by regulation of the commission. The commission may receive drugs surrendered to it subject to the rights of any person lawfully entitled thereto and all drugs in final possession of the commission may be disposed of or destroyed under its direction. The commission shall keep a record of the receipt and disposition thereof

**§435 Notice of conviction of professional man sent to licensing board**

1 On conviction of any physician, dentist veterinarian or apothecary for wilful violation

of any of the provisions of this article, a copy of the sentence and of the opinion of the court or magistrate, if any be filed, shall be sent by the clerk of the court, or by the magistrate, to the board or officer having power to suspend or revoke the license or registration of the person convicted, for such action as the board or officer deems proper

2 At the request of such board or officer, the clerk or magistrate shall send to such board or officer a transcript of the record or of the proceedings in a court not of record, and such portion of the evidence as may be requested

**§436 Records confidential** Prescriptions, orders, or records required under this article shall not be open to inspection nor shall any information contained therein be divulged except for the purpose of enforcing the laws of this state or the Harrison Act, or on the direction of the department of state police or of the police department of any city to any officer of another state, for the purpose of enforcing the law of such state

**§437 Fraud or deceit** Any fraud, deceit, misrepresentation, subterfuge, concealment of a material fact or the use of a false name or the giving of a false address in obtaining treatment in the course of which habit-forming drugs in excess of lawful quantity shall be prescribed or dispensed or in obtaining any supply of such drugs shall constitute a violation of the provisions of this article and shall not be deemed a privileged communication. The wilful making of any false statement in any prescription, order, report, or record required under this article shall constitute a violation of this article. No person shall for the purpose of obtaining any habit-forming drug falsely assume the title or represent himself to be a manufacturer, wholesaler, apothecary, physician, dentist veterinarian, or nurse or utter any false or forged order or prescription for or label for a container of or for habit-forming drugs, or affix such label, or alter, deface or remove any such label

**§438 Commitment of addicts procedure discharge** 1 At request of addict A magistrate, upon the voluntary application to him of any habitual user of any habit-forming drug may commit such person to any correctional or charitable institution maintained by the state or any political subdivisions thereof or private hospital, sanatorium or institution, where drug addiction may be treated

2 Person accused of crime Any trial court having jurisdiction of a defendant who is a prisoner in a criminal action or procedure, if it appears that the defendant is a habitual user of habit-forming drugs and is suffering as a result of such use, may likewise so commit such de-

fendant, at any stage of such action or proceeding and direct a stay of proceedings (or suspend sentence or withhold conviction) pending the period of such commitment but not exceeding sixty days without a further order of the court

3 Discharge Whenever the medical officer of the institution, or if there be no medical officer, the superintendent, shall certify to the committing magistrate or court that any person so committed has been sufficiently treated, or give any other reason which is deemed by the magistrate or court to be adequate and sufficient, he may in accordance with the terms of commitment discharge the person so committed, or return such person to await the further action of the court, provided, however, that when such commitment is to an institution under the jurisdiction of the department of correction, or other similar department in a city of the first class, where there is a parole commission established pursuant to law, such commission shall act in the place and stead of a chief medical officer for the purpose of making such a certificate

§439 Exceptions and exemptions not required to be negated In any complaint, information, indictment, or other writ or in any action or proceeding brought for the enforcement of any of the provisions of this article, it shall not be necessary to negative an exception or exemption and the burden of offering proof of any such exception or exemption shall be upon the defendant

§440 Enforcement This article shall be enforced by the judicial and police authorities of the state and of the political subdivisions thereof engaged in the enforcement of the law Such authorities and their agents shall have access at all times to all orders, prescriptions or records to be kept under this article

§441 Penalties A violation of any provision of this article shall constitute a misdemeanor

§442 Constitutionality If any provision of this article is declared unconstitutional or the application thereof to any person or circumstance is held invalid, the validity of the remainder of

this article and the application thereof to other persons and circumstances shall be affected thereby

§2 Section four-b of such chapter, as added by chapter five hundred and fifty-nine of the laws of nineteen hundred and thirteen, is hereby amended to read as follows:

§4-b Duties of commissioner with respect to laboratories 1 The commissioner of health shall establish and maintain one or more laboratories with such expert assistants and such facilities as are necessary for routine examinations and analyses, and for original investigations and research in matters affecting public health He shall have authority to make, at the expense of the state, such examination and analyses at the request of any health officer or of any physician He may enter into contracts with laboratories in localities accessible to the various portions of the state for the prompt examination of specimens received from local health officers or physicians and for the immediate report thereon, at the expense of the state, provided that all such laboratories shall conform to standards of efficiency established by the public health council, and that no obligation shall be incurred by the commissioner in excess of the sums available therefor

2 There shall be at least one laboratory analyst who shall examine and analyze all habit-forming drugs as defined in this chapter, submitted to him by any official of the state or of any political subdivision thereof, engaged in the enforcement of the narcotic drug control law or any law of similar purpose and who shall be detailed by the commissioner to aid any such official of the state and to give evidence in any proceeding on behalf of the state in connection with such enforcement

3 Section 1746 of the Penal Law as added by chapter one hundred and thirty of the laws of nineteen hundred and twenty-three and any and all acts inconsistent with provisions of this article are hereby repealed

§4 This act shall take effect immediately

## CHIROPRACTORS BARRED FROM PRACTICE IN CITY HOSPITAL

February 27, 1924

Hon Ernest Cawcroft,  
Corporation Counsel,  
Jamestown, N Y

My DEAR SIR

I have read your opinion regarding the admission of chiropractors to the City Hospital, as set forth in the *Jamestown Journal* of February 20th, with a great deal of interest May I con-

gratulate you on the clarity and tact which you have embodied in the decision?

Personally I do not see how you could have reached any other conclusion I am taking the liberty of sending the clipping to the *NEW YORK STATE JOURNAL OF MEDICINE*, which I think may desire to publish the resume.

Very truly yours,

MATTHIAS NICOLL, JR.,  
*Commissioner of Health*

According to Memorandum Filed With City Clerk by Corporation Counsel Ernest Cawcroft, the Hospital and Health Laws of the State Are Based Upon the Idea That Patients Must Be Admitted by the Direction of Physicians and Subject to Medical Treatment While in the Hospital—He Points Out That This Is No Reflection Upon the Treatment of the Chiropractors but That the Treatment Given by Them Does Not Meet the Requirements of the Law Relative to the Treatment of Persons Confined to a City Hospital—Suggestion Is Made by Corporation Counsel That Insofar as Chiropractors Do Not Attempt to Engage in the Practice of Medicine, as Defined by the Law, Such Persons May Be Summoned to the Hospital for Treatment of Patients Whenever Such Treatment Is Approved by the Physician in Attendance Upon the Patient—Complete Text of Mr Cawcroft's Memorandum

ment while in the hospital This is another chapter in the discussion which was started before the Board of Public Welfare at its meeting two weeks ago when the whole question was the subject of a long debate between the chiropractors, interested citizens, members of the board, and Health Officer John J Mahoney

Mr Cawcroft makes it clear that the hospital and health laws of the state are based upon the idea that patients must be admitted by the direction of physicians and subject to medical treatment while in the hospital He points out that this is no reflection upon the treatment of the chiropractors, but that the treatment given by the latter does not meet the requirements of the law relative to the treatment of persons confined to a city hospital He urges that the Board of Public Welfare must insist, for very many reasons, upon the treatment of patients by physicians to prevent communicable disease from spreading and to comply with the law

He suggests that in so far as chiropractors do not attempt to engage in the practice of medicine, as defined by the law, that such persons may be summoned to the hospital for the treatment of patients whenever such treatment is approved by the physician in attendance upon the patient

Corporation Counsel Ernest Cawcroft has filed in the office of the city clerk, as secretary of the Board of Public Welfare, a memorandum bearing upon the application of the chiropractors for permission to take patients to the city hospital or to respond to the request of patients for treat-

### MR CAWCROFT'S MEMORANDUM

The text of Mr Cawcroft's memorandum is as follows

To the Board of Public Welfare

Several chiropractors have asked this board to extend to them privileges

(a) To place patients, in their charge, in the city hospital for treatment

(b) To comply with the request of patients, already in the city hospital, for treatment

These applications have raised definite questions as to the power, responsibility and duty of this board in the administration of the city hospital and the supervision of patients admitted to its privileges

Thus, I comply with your formal request for a summary of your powers and duties in connection with these applications

This board is given complete administration and control of the hospital by section 116 of the 1923 charter of the city of Jamestown 'The present hospital of the city, and any additions or extensions thereto is hereby declared to be a public hospital, subject in every manner to the control of the Board of Public Welfare. The power hereby vested in this board shall be exercised by it through a superintendent of hospital

Section 117 amplifies the powers and duties of this board to manage, conduct and supervise other buildings and houses which may be situate

on the hospital premises and for the protection of the public health from infection and disease

The jurisdiction of this board over the hospital is further amplified by the fact that section 113 of the same charter vests this body with the powers of a local board of health and requires it to enforce the general health laws of the state. It follows, therefore, that this board cannot disassociate itself from its board of health functions when exercising jurisdiction over the city hospital as a hospital commission.

It is clear from an examination of title 8 of the 1923 charter of the city of Jamestown that its provisions are based upon an acceptance of the germ theory, the communicability of disease and the modern science of bacteriology. Whether these theories are true or false need not be discussed in this memorandum because the several members of the board, by their oaths of office, have conceded those principles when they accepted office as health and hospital commissioners.

The public health law and the general municipal law of the state vest additional powers in the health and hospital boards of this city by express provision of the 1923 charter.

Subdivision 4 of section 129 of article 6 of the general municipal law requires that public hospital board shall provide for the medical care and treatment of all persons admitted to the hospital.

Such hospital boards are required to function through a superintendent, as in the local situation, and under subdivision 6 of section 130 of the general municipal law it is required that the superintendent shall also cause a careful examination to be made of the physical condition of all persons admitted to the hospital.

The law requires that a public hospital shall admit to its privileges a person brought to its doors in an ambulance and in an injured condition. Subject to this exception, it is clear that the public health law, the general municipal law, and the charter of the city of Jamestown contemplate the admission of persons to this hospital after diagnosis as to the nature of their disease and the giving of medical treatment to such persons following their admission. Without such diagnosis and subsequent treatment this board is not in a position to protect other patients and the community from communicable diseases, the existence of which is accepted as the basis of the laws cited. The board cannot perform its health and hospital functions unless it maintains its right to determine that patients be admitted upon the diagnosis and recommendation of a licensed physician, and that such patients are prepared to submit to medical treatment under the supervision of such a physician after admission to the hospital.

The practice of medicine is defined by section 160 of article 8 of the public health law, as follows: "A person practices medicine within the

meaning of this article, except as hereinafter stated, who holds himself out as being able to diagnose, treat, operate, or prescribe for any human disease, pain, injury, deformity or physical condition, and who shall either offer or undertake by any means or method to diagnose, treat, operate or prescribe for any human disease, pain, injury, deformity or physical condition."

The next subdivision of this section defines a physician as a practitioner of medicine, and section 161 provides that no person shall practice medicine unless licensed by the regents and registered, as provided by law. A chiropractor cannot be brought within the definition of a practitioner of medicine. The law does not contemplate his registration as it does in the case of a physician.

Thus, this board faces this dilemma in connection with the application of the chiropractors. It must provide for medical treatment of patients at the hospital and medical treatment is confined to physicians by provision of law. If a chiropractor cannot give that medical treatment, then the board is not justified in admitting his patient to the hospital or in permitting his patient to remain on the premises. On the other hand, if the chiropractor asserts that he does give medical treatment, then the board is in the position of permitting such chiropractor to violate the law on the premises, under its control, because it is a penal offense for anyone but a licensed physician to give medical treatment.

I repeat that this board cannot divorce its health from its hospital functions. It employs both the superintendent of health and the superintendent of hospital. The board faces a common problem through the employment of these persons, firstly, to prevent disease, secondly, to retard its communicability, and, thirdly, to cure the disease.

Its method of meeting this problem is defined by the laws of the state, and those laws are based upon an acceptance of the principles of modern bacteriology. Those who deny the science of bacteriology, or who have not qualified themselves to apply the principles and experience of bacteriology and modern medicine to the determination and treatment of disease, may be within their personal province, but it is clear that the statutes do not contemplate that patients be admitted to public hospitals by their direction and receive treatment under their supervision.

This board faces other questions which bear a collateral relationship to the application of the chiropractors. It is charged, as a health board, with insisting that physicians report communicable disease. It is charged with stamping out communicable disease. The immediate method of stamping out communicable disease is to discover it by diagnosis. The board cannot follow a consistent policy of seeking to stamp out a communicable disease at once and then concede that

patients may be placed upon its premises, without diagnosis at the hands of a physician who has studied the symptoms and nature of communicable disease.

Patients who enter this hospital, relying upon its conduct under medical supervision and under laws based upon an acceptance of the principles of modern medicine and bacteriology, have a right to be assured by this board that other patients suffering from possible infectious, contagious or communicable diseases, which have not been diagnosed at the outset by a physician in charge of the particular patient or patients, will not be placed in nearby rooms. This board cannot perform its full functions as a hospital and health commission unless it adopts every measure provided by law for the protection of one hospital patient from infection by another hospital patient, or patients. This is the basis of the provision of the law that patients shall receive medical treatment, and that medical treatment shall be confined to licensed physicians.

I am aware of the fact that there are many legal decisions declaring that the physician, nurses and other persons in attendance are the agents of the patient and not the hospital. There has been a tendency in some jurisdictions to modify these decisions, but whether the earlier or modified judicial decisions shall be accepted as the rule, indicative of the responsibility of the hospital, or of the physician, to the patient, this board is not relieved from the express provision of the law requiring it to give medical treatment by physicians to those patients within its premises.

A hospital must contemplate the eventuality of death upon its premises. The law requires the death certificate to be signed by a licensed physician or the cause of death to be determined by the coroner. This is one of the many additional reasons why the board must insist that a patient on its premises must be under the care of a licensed physician.

Many of our fellow citizens are keenly interested in the application of the chiropractors. Those citizens report that they have received beneficial treatment from these chiropractors. The excellence of this treatment need not be questioned by this board, and no reflection is made upon the chiropractors or their methods of treatment or operation by the conclusions of this memorandum.

The city hospital is the creation of the charter and the general laws of the state. Those laws contemplate the admission of patients for medical treatment by licensed physicians and not by some-

one else. The law may be based on right or wrong principles but it is clear that the law does not authorize the general admission of patients and their treatment by persons other than the licensed physicians of the state.

The charter gives a wide discretion to this board in the managerial administration of the hospital, but once a patient is within that hospital, the discretion of the board is limited by the provision of the law cited, and many collateral sections of the public health law, which might be quoted but which are not essential to this memorandum.

I find nothing in the law which prohibits the board from permitting patients to have additional or supplementary treatment providing that treatment does not come within the definition of Section 160 as the practice of medicine. The board may be protected by insisting that this supplementary treatment shall be with the consent and under the supervision of the physician in attendance upon the patient. The law holds the physician responsible to the patient for his treatment and subjects the physician to suit for malpractice. It follows that physician who establishes a patient in this hospital will insist that there be no division of authority, but if this board establishes the rule that every patient must be attended by a physician, then the question of supplementary treatment is one to be determined by the patient and the physician, within the limitations of the law defining medical practice.

I summarize my conclusions by suggesting that the board adopt a resolution embodying the following:

1 An injured person brought to the hospital shall be admitted, without medical diagnosis or recommendation, as provided by law, but shall be subject to medical treatment.

2 Any other person or prospective patient shall be admitted upon diagnosis by a physician or upon his recommendation or direction, and shall be subject to medical supervision and treatment by a licensed physician.

3 A person admitted to the hospital, in conformity with the two preceding sections, shall have a right, with the consent of his attending physician, or by his authorization or prescription, to receive additional or supplementary treatment by a chiropractor, within the law.

Dated February 20, 1924

Respectfully submitted,

ERNEST CAWCROFT,  
Corporation Counsel

# THE DAILY PRESS

The question of a pure milk supply is being warmly discussed in Syracuse, according to the *Post Standard* of February 25th, which states that a new health department code goes into effect on March 8th. The new requirement is apparently that all milk sold must first be pasteurized. A group of dairymen, called the Independents, are protesting against the code, and have prepared statistics to prove that practically all the typhoid cases occurring in January had used pasteurized milk, and that out of 326 cases of contagious diseases, 201 were on routes where pasteurized milk was delivered. The figures were evidently prepared by an amateur statistician, for the statement is made that only one-quarter of the milk supply consisted of raw milk, and yet over one-third of the cases of contagious disease had used raw milk. The fact seems to be that in that particular month no milk-borne diseases had occurred.

The question of pasteurized milk comes up before nearly every board of health, but the boards of only the large cities seem able to enforce the requirement. This is largely because pasteurization is an expert process, and is costly unless it is done on a large scale.

The *Syracuse Telegram* of February 25th explains that the opponents of pasteurization cannot upset the code except by going to the legislature and securing a change in the City Charter which gives the Board of Health the power to make regulations regarding the sale of milk. There is no prospect that the legislature will interfere in the local milk supply of Syracuse.

The *Binghamton Press*, February 22nd, tells of trouble over the milk code at Endicott. The Board of Health unanimously voted to retain the regulation of the milk code, forbidding the sale of milk inferior to Grade B, pasteurized. The opposition to the regulation seems to have been led by one dealer who sold Grade B raw milk dipped from the can. The opposition to milk regulations usually comes from some interested dealer whose customers uphold him on the ground of the cheapness of his product.

The *Albany Telegram*, February 24th, carries a headline. "150 Diphtheria Cases Reported in Rensselaer May Compel All Children to Take Schick Immunization Tests in Schools." The article states that most of the cases are among school children, and that an effort is being made

by the City Health Department to compel immediate reports of cases. The cases seem to have been developing over a period of several weeks. If this is so, there is laxity in the measures for detecting and controlling the cases.

The *New York Evening Journal*, February 27th, contains an account of a conference between Commissioner Coler of the Department of Public Welfare, Dr. Miller, Dean of the Long Island College Hospital, John Sullivan, President of the Central Trades and Labor Council, and others for the purpose of promoting a laboratory to be built by the city on the grounds of the Kings County Hospital. The purpose of the laboratory is to aid in the clinical teaching department of the Long Island College Hospital Medical School. It is proposed to specialize to some extent on occupational diseases, especially the detection and treatment of those diseases in their incipency. The officers of the Central Trades and Labor Council are quoted as being heartily in favor of the proposed laboratory and teaching clinic. It would be of very great value to the Medical School if its students could have the advantage of the use of the great amount of clinical material that is available in the Kings County Hospital. If the plans are carried out, the Long Island College Hospital Medical School will be in the front rank in its practical teaching facilities.

The Gloversville Health Budget, published on February 19th in the *Leader Republican*, is as follows:

Collection of Garbage	\$5,150 00
Care of Dump Grounds	900 00
Vital Statistics	1,075 00
Care and Examination of Insane	4 00
Care of Quarantined Families	125 00
Salaries	11,000 00
Health Officer's Supplies	100 00
City Laboratory Supplies	500 00
Annual Report	125 00
Printing and Advertising	50 00
Clinic	300.00
Maintenance of Health Center	432 00
Miscellaneous Expenses	500 00
Delegates' Expenses to Conventions	75 00
Telephone	100 00
<b>Total</b>	<b>\$20,832 00</b>

Over one third of this budget is for the collection and disposal of garbage. These items are not usually charged to a health department. Supplies for the health officer and the laboratory amount to \$600, and a clinic and health center, \$732. The position of public health nurse is abolished. A comparison of this budget with that of other places is impossible unless one knows the method of charging and the efficiency of the lines of health work that are carried on.

There seems to be a revival of plans for the control of places at which soft drinks are sold. The *Albany Times Union* of February 20th tells of the address of Mayor Hackett before the State Conference of Mayors on the operation of an Albany ordinance on the subject. Buffalo and Niagara Falls have adopted regulations requiring the licensing of soda water fountains and other places where soft drinks are sold. Every health officer and sanitarian knows that nearly all containers from which soft drinks are swallowed are washed in water in which disease germs collect, and that the washing places are ideal means for spreading diseases. Yet, strange to say, a very few cases of sickness can be traced directly to soft drink cups.

Another question in regard to soft drinks is their composition. Orangeade made from "pure fruit" is more likely made from coal tar products, and the fraud extends to nearly all other kinds of soft drinks. Regulations on soft drinks are necessary for business honesty as well as for health and decency.

The *Rochester Journal*, February 22nd, contains an editorial regarding the proposed Practice of Medicine Law, but the editor is under the misapprehension that the proposed annual registration during five years means that every doctor must undergo an examination at the end of five years, and will lose his license if he fails to pass. The article says in comment: "Very ignorant persons might fail to pass five-year examinations, but quackery is not confined to the very ignorant. It is most dangerous when accompanied by technical knowledge. However, more means of stimulating diligent and continuous study in this profession is desirable. It is not best that capture of a diploma should be the last word in preparation for a work so important to society."

This clipping is the only one that has come to us bearing upon the proposed Practice of Medicine Act. We have not received any clippings from papers in favor of chiropractors or other cultists.

The *Oneonta Star*, February 21st, carries a striking editorial on "Problems in Physical and Moral Education" in which it contrasts the great

progress made in the prevention of physical ailments with the lesser progress in the prevention of mental and moral diseases. It states that crime has increased faster than the population, and that the increase cannot be charged to poverty, hunger, or hard times. It gives the opinion that the major crimes of murder and robbery are committed mainly by young men from seventeen to twenty-five years of age. A large proportion of the criminals are mentally defective. In normal conditions they have scarcely the mentality of children, filled with dope they have all the characteristics of devils.

The editor states: "The great army of swindlers are well educated men in middle life, and are splendidly equipped to hold their own in the most intelligent society. In addition there are swindlers who keep wholly within the law—in many instances with the pull which enables them to have laws created to meet their desires. One may admire their intellectual condition, of moral education, they have little or none. The schoolmaster has sharpened them intellectually, the minister has done little or nothing for them morally. Perhaps the schoolmaster and the minister might find it profitable to study the methods of the doctor."

A new argument for sleeping with open windows is given in the February 24th issue of the *Troy Budget*. It calls attention to a death from carbon monoxide asphyxiation due to coal gas which seeped through the soil into a cellar and from there spread through the house. This is a real menace, and every doctor practicing in a city has had a similar experience. The arguments for fresh air are clear and cogent, but the gas menace is an additional one of considerable force.

The Brooklyn papers of March 7th carry the news that the medical staff of the South Side Hospital in Bay Shore, Long Island, has resigned as the result of a disagreement with the Board of Managers. A new hospital building of 40 beds, costing \$250,000, has recently been completed and opened, and nearly all the physicians practicing within twenty miles of the hospital are on its staff. The doctors had adopted the standards of the American College of Surgeons. They were holding regular staff meetings, and one of their number was acting as superintendent and donating about half of his time to the administration of the hospital. There was harmony in the staff, and a high class of medical and surgical work was being done. The dispute of the doctors with the board of managers is only a repetition of that which occurs all too frequently, and that is the interference of the lay directors with the purely medical affairs of the hospital.

# Medical Society of the State of New York

## HOUSE OF DELEGATES

March 14, 1924

The regular annual meeting of the House of Delegates of the Medical Society of the State of New York will be held on Monday, April 21, 1924, in the Hotel Seneca, Rochester, N. Y.

ORRIN SAGE WIGHTMAN, M.D., *President*

E. ELIOT HARRIS, M.D., *Speaker*

EDWARD LIVINGSTON HUNT, M.D., *Secretary*

## STATE MEDICAL SOCIETY 118TH ANNUAL MEETING

March 14, 1924

The regular annual meeting of the Medical Society of the State of New York will be held on Tuesday, April 22, 1924, at 8 P.M., in Kilbourne Hall, Eastman School of Music, Rochester, N. Y.

ORRIN SAGE WIGHTMAN, M.D., *President*

EDWARD LIVINGSTON HUNT, M.D., *Secretary*

### PROGRAM

Calling the Society to order by the President, Orrin Sage Wightman, M.D.

Address of Welcome by the Chairman of the Committee on Arrangements, Owen E. Jones, M.D.

Reading of the minutes of the 117th Annual Meeting by the Secretary, Edward Livingston Hunt, M.D.

Address of Welcome by Hon. Clarence D. Van Zandt, Mayor of the City of Rochester.

President's Address, Orrin Sage Wightman, M.D.

## SECTION PROGRAMS

### SECTION ON MEDICINE

Chairman—CLAYTON W. GREENE, M.D., Buffalo

Secretary—ROBERT L. LEVY, M.D., New York City

Place of Meeting—Hotel Seneca

Tuesday, April 22nd, 2 30 P.M.

Joint Session with Sections on Public Health, Hygiene and Sanitation, Pediatrics and Obstetrics and Gynecology

"Results of Investigation of Causes of Death at Childbirth," Otto R. Eichel, M.D., Albany (by invitation)

Discussion by Harold C. Bailey, M.D., New York City  
"A Plea for Better Obstetrical Work," David H. Roberts, M.D., Utica.

Discussion by James K. Quigley, M.D., Rochester  
"Endemic Goitre and Its Prevention," Oliver P. Kimball, M.D., Cleveland, Ohio (by invitation)

Discussion by Frederick W. Sears, M.D., Syracuse, and Joseph Roby, M.D., Rochester

"The Development of the Schick Test," Professor Bela Schick, M.D., Vienna (by invitation)

"The Use of Toxin-Antitoxin Without Schick Test in Young Children," George W. Goler, M.D., Rochester

Discussion by William H. Park, M.D., New York City, and George W. Goler, M.D., Rochester

"The Policy of the Industrial Hygiene Division of the New York State Department of Labor," Leland E. Cofer, M.D., New York City (by invitation)

Wednesday, April 23rd, 9 30 A.M.

Joint Session with Section on Public Health, Hygiene and Sanitation

"Incidence of Infection in Tonsillectomized Children," Albert D. Kaiser, M.D., Rochester

"Treatment of Acute Rheumatic Fever," Homer F. Swift, M.D., New York City

"Treatment of Lobar Pneumonia with Pneumococcus Antibody Solution," Russell L. Cecil, M.D., New York City

"Studies Concerning Relationship of Streptococcus Hemolyticus to Scarlet Fever," Alphonse R. Dochez, M.D., New York City

"Acute Leukemia and Mononucleosis," Nelson G. Russell, M.D., Buffalo

Wednesday, April 23rd, 2 30 P.M.

"Acute Perforative Sigmoiditis," Allen A. Jones, M.D., Buffalo

"Origin of Pain in the Serous Membranes and Its Value in Diagnosis," Joseph A. Capps, M.D., Chicago, Ill. (by invitation)

"How Can We Best Treat Pernicious Anemia," Louis M. Warfield, M.D., Ann Arbor, Mich. (by invitation)

"Some Neglected Phases of Coma in Diabetes," William S. McCann, M.D., Baltimore, Md. (by invitation)

"Reports on the Use of Insulin Throughout the United States to Date," G. H. A. Clowes, M.D., Indianapolis, Ind. (by invitation)

### SECTION ON SURGERY

Chairman—EMIL GOETSCH, M.D., Brooklyn

Secretary—MARSHALL CLINTON, M.D., Buffalo

Place of Meeting—Hotel Seneca

Tuesday, April 22nd, 2 30 P.M.

"Fracture of the Skull," George J. Heuer, M.D., Cincinnati, Ohio (by invitation)

Discussion by James H. Lewis, M.D., Buffalo, and William Sharpe, M.D., New York City

"Nervous and Mental States Following Head Injury," David E. Hoag, M.D., New York City

Discussion by William Sharpe, M.D., New York City  
"Fracture of the Femur," S. Potter Bartley, M.D., Brooklyn

Discussion by James H. Lewis, M.D., Buffalo

"Fracture of the Upper End of the Humerus," Lantern Slide Demonstration, James N Worcester M.D., New York City

Discussion by Armitage Whitman, M.D., New York City

"Clinical Deduction from a Study of Bone Repair" Frederic W Bancroft, M.D. New York City

Discussion by S Potter Bartley, M.D., Brooklyn.

Wednesday, April 23rd, 9 30 A.M

"The Diagnosis of Bone Tumors" James H Hitzrot M.D., New York City

Discussion by William B Coley, M.D., New York City

"Tumors of the Jaw" Lantern Slide Demonstration, Joseph C. Bloodgood M.D. Baltimore, Md (by invitation)

Discussion by James M Hitzrot, M.D., New York City

"Results After Radiation of Malignant Diseases," Bernard F Schremer M.D., Buffalo.

Discussion by Burton T Simpson, M.D., Buffalo (by invitation)

"Destruction and Removal versus Removal and Destruction in Accessible Neoplastic Diseases" Slides and Motion Pictures George A Wyeth M.D. New York City

Discussion by Howard A Kelly, M.D., Baltimore, Md (by invitation)

"The Principles of the Four Types of Skin Grafting with an Improved Method of Treating Total Avulsion of the Scalp" Clarence A McWilliams M.D., New York City

Discussion by Royale H Fowler M.D., Brooklyn.

Wednesday, April 23rd 2 30 P.M

"Varicose Disease," Robert F Barber M.D. Brooklyn. Discussion by William F Campbell M.D. Brooklyn and Fuad I. Shatara M.D. Brooklyn.

"Prostate and Renal Surgery Under Regional Anesthesia" Motion Picture Demonstration Oswald S Lowrey M.D. New York City

Discussion by Julius L. Waterman M.D. Rochester and Ernest M Watson M.D., Buffalo

"The Gram positive Anaerobes in Appendicitis and Its Complications," John E. Jennings, M.D. Brooklyn.

Discussion by Russell S Fowler, M.D. Calvin B Coulter M.D. (by invitation) and Louis Nerb Ph.D. (by invitation) Brooklyn

"Operation In Difficult Hernias with Special Reference to Fascial Transplant and Local Anesthesia" Martin B Tinker M.D., and H. B Sutton M.D., Ithaca.

Discussion by William D Johnson, M.D., Batavia, and John E. Wattenberg M.D. Cortland.

"Hemorrhage and Its Treatment," William D Johnson, M.D., Batavia.

Discussion by Howard L. Prince, M.D. Rochester

SECTION ON OBSTETRICS AND GYNECOLOGY

Chairman—WILLIAM T. GERTMAN M.D., Buffalo

Secretary—PAGE E. THORNHILL M.D., Watertown

Place of Meeting—Hotel Seneca

Tuesday April 22nd, 2.30 P.M

Joint Session with Sections on Medicine, Pediatrics and Public Health, Hygiene and Sanitation.

"Results of Investigation of Causes of Death at Child Birth" Otto R. Eichel, M.D. Albany (by invitation)

Discussion by Harold C. Bailey M.D., New York City

"A Plea for Better Obstetrical Work," David H Roberts M.D., Utica.

Discussion by James K. Quigley M.D., Rochester

"Endemic Goitre and Its Prevention," Oliver P Kimball, M.D., Cleveland, Ohio (by invitation)

Discussion by Joseph Roby M.D. Rochester, and Frederick W. Sears, M.D., Syracuse.

"The Development of the Schick Test," Professor Bela Schick, M.D., Vienna (by invitation)

"The Use of Toxin antitoxin Without Schick Test in Young Children," George W. Goler, M.D. Rochester

Discussion by William H. Park, M.D., New York City and George W. Goler, M.D., Rochester

"The Policy of the Industrial Hygiene Division of the New York State Department of Labor" Leland E. Cofer M.D., New York City (by invitation)

Wednesday, April 23rd, 9.30 A.M.

"Review of Four Years' Work with Radium in Gynecology" Thomas P. Farmer M.D. Syracuse.

"Sterility—Non Surgical Treatment," Timothy F. Donovan, M.D. Buffalo (by invitation)

## ENTERTAINMENTS

Wednesday Evening

Annual banquet at the Hotel Seneca at 7.30 P.M.

## COUNTY SOCIETY MEETINGS

### RICHMOND COUNTY MEDICAL SOCIETY

A regular meeting of the Richmond County Medical Society was held at the Staten Island Academy on Wednesday evening, February 13th. The meeting was called to order at 9 p. m. with Dr Presley in the chair. Those present were Drs Klauher, Shields, Reig, Amoury, Timpon, Driscoll, Pearson, Mord, Hetzel, Law, Diamond, Jessup, Becker, Buntin, Harwood, Schward, Catalano, Presley, Rueger

The minutes of the previous meeting were read and approved. The minutes of the meeting of the Comitia Minora were read and approved. Dr Jessup declined the honor of chairman of the Legislative Committee and Dr Smith was appointed to take this chairmanship.

A letter from the Medical Society of the State of New York regarding the Pitt case was read and a motion made that the method of procedure be forwarded to him was carried.

Dr Law complained against a Department of Health nurse who criticised his use of instruments in a maternity case to the patient and insisted that they take the baby to the Baby Health Station for regular weighing and examination. A motion was made that a Committee take this matter into conference with the Department of Health. Dr Mord, Chairman, Drs Pearson and Shields

Dr Driscoll spoke on the code of ethics of

the State Society and asked what action would the Society take if the code was violated. Dr Presley promised to write to several of the County Societies and obtain from them their method of procedure.

Dr James F Grattan was introduced as the speaker of the evening on "Reconstructed Surgery of the Face." Dr Grattan showed and explained a number of fine slides taken before and after operation, also presented patients, specimens of tumors, and an unusual life mask of a case. A vote of thanks was tendered to him for his highly interesting and instructive paper.

The meeting adjourned at 11 p. m. to the Staten Island Club for refreshments.

### TOMPKINS COUNTY MEDICAL SOCIETY

Regular meeting of the Tompkins County Medical Society was held on the 15th of January, 1924, with President Parker presiding.

After a short business session the Society listened with a great deal of pleasure to an address by Dr E. A. Bates of Cornell University on the subject of "Cayuga Indian Medicine Men." The Doctor's researches in Indian lore have been thorough and extensive and are of historic value.

He covered the traditional migration of the Indians in prehistoric times from Asia to America, peopling the entire Continent. He then

traced the very much later migration of certain tribes to the region of central New York in search of their "Promised Land" which they claimed to have found here, and here remnants of these same tribes still remain

Herc was formed the first "League of Nations" in the Federation of the Six Nations, and here, almost on the exact spot which later became the birthplace of Susan B. Anthony, they formed and carried into successful operation the first Women's Rights movement which resulted in the women taking over and carrying out the full powers of government, which they do to this day. Is this prophetic?

The Indian Medicine Man was also the Priest and looked after the morals of his people as well as their physical ills. But little surgery was attempted and this was very crude. Many methods were employed in attempting to cure bodily ills. Physiotherapy by means of vapor baths, rubbings, etc. Psychotherapy in the form of medicine dances, prayer, magic, sleight of hand, fetishes, etc. Drug therapy, wholly botanic. Diseases treated were largely gastro-intestinal and such plants were used as mandrake, fennell, sweet-flag, convalleria, prickly-ash, stramonium and wintergreen. Externally there were used mustard, turpentine, poison-ivy and others. For a vermifuge they used any plant with long, slender worm-like roots. Administration was in large doses and given at sunrise only. The infusion was usually employed.

---

Regular meeting of the Tompkins County Medical Society was held on February 19th, with President Parker presiding.

Dr. H. E. Merriam, Chairman of the Banquet Committee, announced that the Annual Banquet will be held March 18th, and that Dr. Hugh Cabot of Ann Arbor, Mich., would be the principal speaker of the evening.

Dr. William A. Smith of Newfield was elected to membership.

Dr. Sutherland Simpson of Cornell University gave an illustrated talk on "The Relation of the Thyroid Gland to Growth and Development" as proven by his experiments on sheep and goats. Twin lambs were secured when possible and the thyroid removed from one, the other being used as a control.

The Doctor's explanation of the work was

very interesting and the results as described and shown by the slides were very striking, the arrested growth and development of the cretin when compared with its normal twin being very pronounced.

Dr. H. S. Liddell of Cornell followed, speaking of "The Relation of the Thyroid to the Neuro-Muscular Mechanism" as evolved from correlated experiments with these same sheep.

The still views brought out very clearly the mechanics of the experiments, and the moving pictures illustrated and served to impress on the mind very forcibly some of the functions of the thyroid and the results of its dysfunction, the comparative and progressive feebleness of the cretin, its characteristic posture and gait and the slowness of its mental processes.

Dr. A. Podansky of Cornell followed, showing the reducing effect of small doses of insulin on the blood sugar of the normal individual and the rapidity of its recovery.

Dr. Wilbur of Cornell spoke briefly of the calcification of arteries after thyroidectomy.

The entire program was instructive, truly scientific and received the close attention it merited.

---

March 10, 1924

MY DEAR EDITOR:

The Medical Society of Bay Ridge, Borough of Brooklyn, is setting the example of action for the protection of the public, which if followed throughout the State, would result in the elimination of chiropractors and other cultists. The members of our Society are making a thorough canvass throughout the Bay Ridge section of Brooklyn for the purpose of definitely ascertaining the names of all those who are legally as well as illegally practicing medicine. A similar canvass is being made in other sections of Brooklyn under the auspices of the Medical Society of the County of Kings and its subsidiary Societies. We expect very soon to have an authoritative list compiled and ready for submission to the proper authorities. The result of this work, we believe, will be most effective and will go a long way toward putting out of business all persons who are illegally practicing medicine in the Borough of Brooklyn.

Yours sincerely,

BRUCE G. BLACKMAR, M.D.,  
President.

## THE METHOD OF OPERATIVE ATTACK FOR CENTRAL LESIONS OF THE LOWER JAW \*

JOSEPH COLT BLOODGOOD, M D

BALTIMORE, M. D

**T**HE lower jaw in this respect is not unlike the long pipe bones

The dental root abscess (granulation tissue tumor cyst) may be compared to the chronic abscess of osteomyelitis, known in the literature as Brodie's abscess. The dentigerous cyst closely resembles the benign bone cyst (ostitis fibrosa cystica), except that it has an epithelial lining of displaced adamantine epithelium. The rare giant cell tumor of the lower jaw does not differ from central giant-cell tumors of the long pipe bones except that it is usually situated in the body of the lower jaw, while in the long pipe bones the giant-cell tumor with rare exceptions (3 in 200 cases) is strictly a lesion of the epiphysis.

There is in the lower jaw a central tumor, fibromatous in character, which very often is histologically cellular so that it must be looked upon as a fibro-sarcoma. Clinically it runs the course of a malignant tumor. Sometimes this tumor is oedematous and resembles the myxoma, sometimes it contains pure myxomatous tissue.

In addition to these tumors, there is one other of dental origin which is not found in any other bone, except the upper jaw, nor in any other region outside the zone of the enamel organ. This tumor is known chiefly under the name of *adamantine epithelioma*. Histologically, it resembles an ordinary carcinoma of the spinal cell type, but unlike carcinoma it does not metastasize.

The adamantine epithelioma usually remains a local growth, although it may reach great size and still be within a definite capsule. When incompletely operated on it is readily transplanted like the myxoma and death may follow from the growth of the transplanted tumor into the cranial cavity.

The tumors therefore, which I wish to dis-

cuss are The dental root abscess (granulation tissue tumor or cyst), the dentigerous cyst, the fibroma or fibro-sarcoma, the giant-cell tumor, and the adamantine epithelioma. All of these tumors occur in the lower jaw and in their onset may present a clinical and X ray picture in which there may be but slight differences. With rare exceptions, these pathological processes originate in the body of the jaw at some point between the symphysis and the angle. They are lesions of the central portions of the body and not of the alveolar border. They begin about the roots of teeth, and whether there is pain or not the first definite sign is a swelling or bulging of the body of the jaw usually on the outer side below the level of the visible portion of the teeth. It is remarkable how frequently the bulging is on the outer side. There may be no warning by pain or tenderness. This swelling may be the first symptom. The teeth may be absolutely normal or there may be a history of caries, of cavities filled, or teeth extracted. When one palpates the swelling or bulging, it has the shape of a dome, feels like a shell of bone and as a rule the gum tissue over it is normal. Tenderness is not a prominent symptom, except in the dental root abscess group.

The most important means of diagnosis is the X-ray. This should never be neglected.

**X-ray Examination.** From a very large experience the X-ray pictures may be divided into two great groups. One is known as the shadow of the dental root abscess. Now as a matter of fact this absorption of bone about the root of a tooth is rarely associated with true pus. When one extracts the tooth there is no fluid, but attached to the root is a varying amount of granulation tissue, which under microscope is granulation tissue with many leucocytes. The dental root "abscess" is the most common lesion of the body of the lower jaw and when small and con-

fined to the root or roots of a tooth it can be easily recognized

When the bone destruction is greater and reaches the size, say, of a ten-cent piece or more, then one cannot exclude from the X-ray picture alone the other possible lesions which I have just briefly discussed. When the larger defect is due to a dental root abscess as a rule the bone surrounding the chief defect has lost its normal architecture and presents an X-ray shadow usually seen in osteomyelitis. In the other lesions the bone surrounding the defect is practically normal.

The second picture, therefore, is the one in which the bone defect is larger than a five-cent piece.

*Differential Diagnosis* I have just restudied the entire group, and I can see no way, either clinically, or in the X-ray, to be positive of the pathological lesion when the bone defect is larger than a five-cent piece. The differential diagnosis must be made at the operation.

*Method of Attack* Most, if not all, of the smaller tumors can be explored through the mouth, under local anesthesia. It is safer for the patient to attack the larger tumor, especially the recurrent ones through an external incision, which as a matter of fact, leaves very little scar.

The method of attack is based upon the known facts of a continuous restudy of all the cases recorded in the Surgical Pathological Laboratory of the Johns Hopkins Hospital for a period of now more than thirty years.

We must bear in mind, first, that the most dangerous tumor is the adamantine epithelioma. The chief danger is not so much recurrence within an intact bone shell, as the dissemination and transplantation outside the bone shell. Two cases in our list emphasize this. One patient allowed the tumor to grow for twenty-nine years. There had never been an incision, the tumor had never ruptured. It was of huge size, extended from symphysis to the speno-maxillary joint, at the operation the entire lower jaw with the tumor was removed without exposing tumor tissue. This patient lived eleven years and died of other causes at an advanced age.

The second patient died of the disease twenty-nine years after the onset of the first swelling and twenty-five years after the first operation which was incomplete. In all, this patient had fourteen operations, three of them after the jaw had been completely removed, for recurrences in the soft parts. The patient finally died of a growth which involved the brain.

Although the adamantine epithelioma does not metastasize it is very much like the myxoma in its tendency to recur and to become transplanted.

*The Difference Between Complete Resection and Incomplete Removal* In the first 15 years of our experience (to 1905) most of these lesions—the dentigerous cyst, the fibrosarcoma, the

giant-cell tumor and the adamantine epithelioma came under observation after the tumor had been present years and after it had involved the entire jaw. In those cases in which there had been no previous operation and in those cases in which our operation was a complete resection of the type of *en-bloc* resection, there have been no recurrences and no deaths from the disease. There was some operative mortality. When there had been previous operation with recurrence even the most extensive resection usually failed to cure the adamantine epithelioma.

Then there is a group of cases which came under the care of the medical profession when the tumors were small and in view of the apparently minor operation were treated by surgeons who were not familiar with the major surgery of the jaw and not specially trained in the different pathological lesions of the lower jaw. Their method of attack was usually simple curetting without chemical or thermal cauterization. This curetting frequently cured the dentigerous cyst, rarely the giant-cell tumor, and apparently never the fibrosarcoma or adamantine epithelioma.

At the present time there comes under observation a smaller number of the huge central tumors of the lower jaw, but unfortunately, a larger number of recurrences of the smaller lesions first operated upon in the early favorable period, but with a faulty method of attack.

I have had sufficient experience with the method of attack about to be described and the interval of time is sufficiently long to justify its publication at least as a preliminary report.

#### THE EMPLOYMENT OF THE ELECTRIC CAUTERY AND THE PREVENTION OF THE CONTINUITY OF THE LOWER JAW IN LARGER TUMORS

*Case 1 (Pathol No 27596) Operation February, 1921*

*Diagnosis* Solid adamantine epithelioma of the left lower jaw involving the ramus, angle and body.

White male, age forty-two, swelling has been present twelve years, history of two external operations, curettings, under the diagnosis of dentigerous cyst, six and three years ago.

This patient, March, 1924, four years and two months, is apparently free from recurrence, and the function of the lower jaw is unimpaired.

Fig 1 pictures the patient before operation. The swelling we see is an expanded thin bone shell. Fig 2, the X-ray before operation, shows the defect in the body, angle and ramus due to the expansion of bone. Only the thicker portion of the jaw is seen in the X-ray. The expanded, thin bone shell does not show, and in the picture suggests total destruction. As a matter of fact the bone shell was intact, except at the position of an opening into the mouth through the mucous membrane at the junction of the middle and outer third of the body of the expanded portion of the lower jaw.

Fig. No. 1

Case 1 Pathol No 27596 Adamantine epithelioma. Central tumor of lower jaw. The visible swelling is due to the expanded bone shell. For X ray see Fig 2.

Fig No. 3

Case 1 Pathol. No 27596 The result after operation on the patient shown in Fig 1. Interval of time almost three years. The scar represents the incision for the skin muscle periosteal flap.

the scar of the skin muscle and periosteal flap. The depression below the zygoma is due to muscle atrophy. You will observe that no nerves have been cut nor was the parotid or its duct injured. No teeth, except the non erupted molar, were extracted during the operation.

**Operative Technique** I am copying practically the note dictated during the operation. The operation was performed under procaine at St Agnes Hospital. The skin incision corresponded to that which has been well established for the external exposure of the inferior dental nerve. The thin expanded bone shell was exposed and then the periosteum was stripped from this bone shell until we brought to view a dome of bone almost as large as an orange. It extended at least from the mental foramen almost to the zygoma. The operation was made painless by copious infiltration of all the soft parts. The bone shell gave parchment crepitation, it was a little thicker than an egg shell, but it could not be burned through with the cautery. I therefore packed against the soft parts an alcohol sponge and removed a piece of bone shell the size of a silver dollar. First there escaped some clear fluid which was mopped up with an alcohol sponge. The cavity was filled with a red, friable granulation tissue with many white and gray opaque areas. The mottled coloring resembled that of the giant-cell tumor, but the granules were larger

Fig. No. 2.

Case 1 Pathol No 27596. X ray Adamantine epithelioma. Central tumor of lower jaw. The visible defect of body angle and ramus is due to bone expansion and not to total bone destruction. For clinical picture see Fig 1.

The X-ray after operation is not reproduced because it is identical with Fig 2, before operation, except that non erupted molar tooth has been removed. None of the bone of the lower jaw seen in the X-ray was excised, and the function of the jaw is as good as before operation.

Fig 3 shows the patient on December 1, 1923, almost three years after the operation. One sees

and coarser. There were no partitions in the bone cavity. The expanded bone on the inner side was smooth and thin, there was no connective-tissue lining. Immediately we removed the tumor tissue with carbolic swab followed by alcohol and then swabbed with fifty per cent solution of zinc chloride, and then burned with the cautery. Before using the cautery all the sponges around the wound were changed to gauze wet in salt solution (fire protection).

At this time the frozen-section report was announced as an adamantine epithelioma. I examined the section (Fig 4) and it was quite typical of the adamantine epithelioma.

FIG No 4

Pathol No 17527 Photomicrograph of adamantine epithelioma

There was no pain until the nerve was exposed. Then we injected a four per cent solution of cocaine into the nerve. The nerve passed through the tumor. On the portion of the body of the lower jaw shown in the X-ray (Fig 2) there were here and there little recesses filled with tumor tissue. These were curetted out with the electric cautery. We were not bothered with hemorrhage. After the bone shell was cleaned of tumor tissue all the thin, expanded portion was removed subperiosteally. As this shell joined the thicker shaft, it became a little thicker. As stated before, what bone was not removed is shown in Fig 2. In removing the bone shell on the mucous membrane side we encountered a perforation in the bone shell communicating with an opening in the mucous membrane. We removed this shell and recur to the mouth. This opening between the bone about it was removed. The mouth was closed to 1905. The cyst, the was replaced against

the remaining bone and soft part wound, but not sutured.

Forty-eight hours later Carrel-Dakin tubes were introduced until the wound was cover-slip free from bacteria, the tubes were then removed and the wound healed rapidly by granulation. Retraction of the skin flaps was prevented by adhesive straps.

#### *Clinical Note on Case 1 (Pathol No 27596)*

As this paper is chiefly concerned with the technique of the operative attack of central lesion of the lower jaw, space will not be taken for detailed notes on the clinical picture. The two previous operations—six and three years ago—were external incisions and curettings. The operator informed me that at each operation he found only a cavity filled with fluid. The opening into the mouth has been present since the first operation six years ago. From it there is a slight, but constant discharge. In spite of this portal of entrance there have been no signs of infection. There has been no interference with the function of the lower jaw. The missing teeth were extracted before the swelling appeared.

*Discussion of the Operation in Case 1 (Pathol No 27596)* We are all familiar with the complete resection of the lower jaw and in 1909 (Bryant and Buck's Surgery, Vol VI, page 841) I discussed the solid and cystic adamantine epithelioma and results after complete resection. This was the first case in which the tumor seemed to be small enough to justify this method of attack which had for its object the cure of the disease, and the preservation of the continuity of the jaw. It would have been less difficult in this case to have removed the lower jaw. When I decided upon a conservative operation I was prepared to meet and attack any known pathological lesion described in the beginning of this paper. This method of attack has been tested in central lesions of the phalanges, and long pipe bones, and in smaller central lesions of the lower jaw, with success. This was the first of the large lesions in which this conservative method was attempted. Yet, the size of the expanded tumor was small as compared with those reported by me in Bryant and Buck's Surgery in 1909.

*Case 2 (Pathol No 33629) Operation August 7, 1923, Johns Hopkins Hospital*

*Diagnosis Benign dentigerous cyst of the right lower jaw. Medium-sized bone cavity in the body of the jaw. White female, aged forty-six, swelling six months.*

Fig 5 is an X-ray one month after operation and pictures the disease as well as the X-ray before operation which unfortunately has been lost.

*Method of Attack* The operation was done under local anesthesia with procaine. The expanded bone shell was present on the outside of the jaw only, opposite the position where two molars had been extracted. The base of the

Pathol. No 32270 Photograph of gross appearance of the connective tissue lining of a benign dentigerous cyst. For microscopic picture see Fig 7

projecting dome of bone shell, a little smaller than a twenty five cent piece. In this case, the operation was done through the mouth. A flap of mucous membrane and periosteum was turned back. The bone shell was exposed as in Case 1. It was too thick to perforate with the cautery. The shell was removed and its contents curetted with the electric cautery. As we were in the mouth carbolic and alcohol and zinc chloride were not employed, because it is difficult to protect the mucous membrane from a chemical burn. After thoroughly removing every bit of tissue lining the bone shell, that portion of the bone shell which was expanded and projected from the body, was removed and the mucous cutaneous flap pushed back into the cavity and partially sutured. No teeth were removed (see Fig 5).

**Pathology** The frozen sections demonstrated that we were dealing with a connective tissue wall lined by epithelium of the adamantine type. Fig 6 pictures the connective tissue lining and Fig 7 the epithelial lining of the cyst wall.

FIG. No. 7

Pathol. No. 32270. Photomicrograph showing the epidermal covering of an adamantine epithelioma lining the connective tissue wall of a dentigerous cyst. The X ray of this case was practically identical with that shown in Fig 8.

However when I removed the bone shell in Case 2 I exposed a hemorrhagic, cheesy friable material suggesting a giant cell tumor. Yet the frozen section showed nothing but blood and connective tissue. Then I found a definite connective tissue lining 2 mm in thickness. I have never found this in the giant cell tumor or the adamantine epithelioma, but only in the epithelium lined dentigerous cyst. My notes dictated at the operation read as follows: 'I find a definite connective-tissue lining the surface of which looks like mucous membrane. The frozen sections show no giant cells and no adamantine

epithelium in the connective-tissue wall, but in some of the sections, on the surface of the connective tissue there is a layer of epithelium not unlike the epidermis in the dermoid cyst

*Comparison of Case 2 With Other Dentigerous Cysts* This is the first dentigerous cyst which I have explored to have contents other than clean or cloudy fluid. I cannot explain the hemorrhage, except that it is only six months or less since the teeth were extracted

*Discussion of the Clinical Picture in Case 2* This swelling observed in 1923 is among those of shortest duration. Before the educational efforts the average duration of central tumors of the lower jaw was five years or more

*Healing of the Wound in Case 2 (Pathol No 33629)* This patient left the hospital with a sinus and came under my observation again October 8, two months after operation, because there was continuous oozing of blood from the sinus and exuberant granulation tissue protruding from the opening. I knew this was due to small particles of dead bone destroyed by the cautery. My associate in dentistry, Dr Long, swabbed the wound daily with pure carbolic followed by alcohol. This checked the bleeding immediately. On the fifth treatment a few sand-like pieces of bone came away, and within a week the wound was healed

*Remarks* There is more apt to be trouble from necrosis of bone after the thermal cautery than after chemical cauterization with carbolic or zinc chloride, but when the wound is given proper aftercare it is never an annoying complication. With the giant-cell tumor equally good results have been obtained with chemical cauterization, but my experience leads me to feel that for myxoma, adamantine epithelioma and sarcoma one should never rely on chemical cauterization alone, but depend chiefly upon the electric cautery

*Comparison of the Electric Cautery with Electric Coagulation* My experience with the use of the cautery is limited to the electric, the Percy and the actual cautery, and with these and chemical cauterization with carbolic and zinc chloride I can control the limit of tissue destruction about as accurately as one can control the amount of tissue removed with the knife

The wounds I have seen treated with the different forms of coagulation cauterization resemble a deep radium or X-ray burn, or a burn due to molten metal. The necrosis of the tissues goes far beyond that necessary to accomplish a cure and often is very irregular in its action. I have been studying today three recurrences of cancer treated by this method. Huge excavated ulcers have been produced, yet, in the edge cancer nests were found. To repeat, the great advantage of the electric, Percy or actual cautery is that the operator is in command of the local wound which

is to be produced in attacking the malignant disease

*Case 3 (Pathol No 32991)* Operation April, 1923, Dr Edwin L. Bartlett, University of California Hospital, San Francisco

*Diagnosis* Central small giant-cell tumor of the lower jaw

FIG No 8

*Case 3 Pathol No 32991* Central tumor of the lower jaw. Intact bone shell. Benign giant-cell tumor. Patient of Dr Bartlett of San Francisco

Fig 8 shows a central cavity smaller than Fig 5. As discussed in the beginning of this paper, I have no evidence as yet which would allow me to see in this X-ray any indication of the exact pathology of the lesion within the bone shell. In my experience it is too large and its outlines too smooth for a dental root abscess or granulation-tissue tumor. It could be a dentigerous cyst or a dermoid, an adamantine epithelioma or a giant-cell tumor, a fibroma or a fibrosarcoma. Our chief experience with these lesions of the lower jaw has been with larger tumors, often extending from symphysis to joint, often perforated and sometimes infected, frequently with the bone shell destroyed, so that the fibroma or fibrosarcoma has been interpreted as a periosteal rather than central lesion

The education of the public is bringing central lesions of lower jaw as pictured in Fig 5, an ignorant woman coming to the Johns Hopkins Hospital Dispensary within six months after the first swelling was observed

*Operative Attack in Case 3, by Dr Bartlett* Ether intrapharyngeally. The periosteum over the bone shell and the alveolar process were removed with the chisel and curette. The adjacent teeth were extracted, because their roots were exposed in the bone cavity. The interior dental canal was exposed by the tumor, and the artery

gave troublesome bleeding. After removing the bone shell and the tumor the cavity was cauterized with a red hot iron, and the hemorrhage controlled by wax and a gauze pack.

FIG. NO. 9

Path No 4520 Photomicrograph of a giant cell tumor. Cured from the upper end of the tibia in 1902. No recurrence after 21 years.

**Pathology** Dr Bartlett writes "The tumor was firm, moderately friable, reddish gray, and only slightly vascular, the vessels leading to the tumor were relatively few, but rather large."

The sections sent me show a typical giant cell tumor.

**Result** Nine days after operation Dr Bartlett's patient left the hospital with a granulating wound and without evidence of osteomyelitis.

**Conclusions** We have just restudied all the examples of central lesions of the lower jaw which have accumulated in the Surgical Pathological Laboratory of the Johns Hopkins Hospital since the publication of my article in Bryant and Bucks Surgery in 1909, and we find that the educated public is seeking advice at shorter periods after the first appearance of the swelling. The huge tumors of the lower jaw are becoming very rare. The smaller tumors as illustrated in the X-rays of Figs 5 and 8 are on the increase. We have examples of all types described here. The method of attack which has accomplished a cure in all the pathological possibilities as described here, has been tested and so far has been successful. Examples of dentigerous cysts, adamantine epitheliomas and giant cell tumors have been subjected to X-ray and radium treatment before operation with appreciable effect. There is no objection to this preliminary radiation, nor to its continuance after operation. But the evidence up to the present time indicates that thermal cauterization combined in certain cases with chemical is sufficient.

Further reports will be made on a detailed study of the total number of cases in each group.

NOTE—All patients reported in this paper are well and free from recurrence March, 1924.

## THE DEVELOPMENT OF THE ACCOMMODATIVE APPARATUS IN RELATION TO MYOPIA AND PRESBYOPIA \*

GEORGE W VANDEGRIFT, M.A., M.D.  
NEW YORK CITY

IN a study of the accommodative apparatus we early come upon problems many of which up to the present time have not been satisfactorily solved. Such, for instance, is the role played by the accommodative apparatus in myopia. It is a common observation that in axial myopia the ciliary muscle is sub-normal in size and that the circular fibres of Müller are reduced in number, if not entirely absent but whether these changes bear a causative or resultant relationship to the myopia observers differ. Just as long as we converge our vision upon myopia as a refractive anomaly and neglect its larger biological relationship to the evolution of the accommodative apparatus this doubt will persist, and the basic cause of myopia will remain hidden in obscurity.

Similarly, while we have solved quite well many of the problems concerned with the

function of accommodation, we still cannot answer fully the question—why presbyopia? Nor does the common definition of the term help us any. We have seen emmetropes of fifty years or more whose power of ocular range was sufficient for all visual purposes, and we have seen emmetropes of thirty and thirty-five whose amplitudes of accommodation were insufficient for continued near work. It does not help us any to say that such are not or are under the influence of "old age sight." Presbyopia is a misnomer and erroneous, leading to confusion and illogical inference. The answer is that within his present environment the physical development of man, exemplified by his accommodative apparatus is not fully and perfectly adapted to the exigencies of his daily life. Both myopia and presbyopia are disharmonies, the causes of which we must seek in evolution.

Development displays two correlated processes of evolution, the reaction of the organ-

\*Read at the Annual Meeting of the Medical Society of the State of New York at New York City May 23, 1922.

ism to its environment, and the action of environment upon the organism. In this complex interaction the advance to perfect adaptation is made by the accumulation of advantageous influences, and the discarding of those that are profitless. This law is well exemplified in the development of the accommodative apparatus.

While it is true that the range of accommodative power is greatest in man and proportionately less as we go down the animal scale, nevertheless for precision and nicety of adaptability man's accommodative apparatus is surpassed by several members of the animal kingdom, especially birds. Indeed, throughout the animal kingdom, except in man, the ocular apparatus displays an excellent adaptation of form and function to visual requirements. With the development of man's intensive cerebration changes in form have not kept pace with the demands laid upon function. The basic reason for this lies in the evolution of prolonged infancy and childhood during which the rapid increase in mental power is not accompanied by adequate structural adaptation.

It is to this disparity of form and function in modern man that we must turn for enlightenment upon the problems of myopia and presbyopia.

The accommodative apparatus in man and the apes differs very markedly from that of the animals below the primates. In the lowest mammals we find no traces of a ciliary body and in the higher forms, such as the ungulata, it consists entirely of longitudinally running fibres. In man and the apes the development of the ciliary muscle is much more highly intensive and the muscular fibres more complex, for it is only in these highest forms that we discover radial and circular fibres. Similarly there is a significant difference in the arrangement of the pectinate ligament. In the lower animals it is a very extensive structure, filling up the angle of the anterior chamber, and allowing no anterior fixed point of attachment for the ciliary body. In the primates the ligament is concentrated and withdrawn from the angle of the anterior chamber, forming a fixed point of origin for the ciliary muscle.

In all the adult primates, including man, the arrangement of the accommodative apparatus is similar. The ciliary processes, no longer in close approximation with the roots of the iris, are displaced outward and backward. The pectinate ligament, giving an anterior fixed point to the ciliary muscle, allows this muscle in contraction to be drawn forward, releasing the tension of the pectinate ligament. In the human embryo, however, and in the child up to

the second year, the ciliary processes occupy an anterior and interior position closer to the crystalline lens than in the adult, a condition quite like that which we find in the lower mammals. With the growth of the eye the ciliary processes are drawn away from the lens and are displaced posteriorly. Secondly by this action the spherical contour of the lens, which is characteristic of this structure in the lower animals and in the human embryo, gradually is flattened by the traction produced by the suspensory ligament upon the anterior and posterior capsules. Due to the retrogression of the ciliary processes the traction on the anterior capsule of the lens is greater than that upon the posterior, whereby the anterior lens surface acquires a higher radius of curvature than the posterior. Incidentally, these developmental facts furnish a further proof of the Helmholtz theory of accommodation.

It is well to remember at this point that the human eye at birth is hypermetropic, a condition almost generally found among lower animals, and it is during the two formative decades of life, from the second to the twentieth year, that myopia develops.

In the lower animals the ciliary muscle consists entirely of horizontal fibres, the muscle of Brücke, the circular or Müller's fibres being universally absent. In myopia, similarly, the ciliary muscle largely consists of longitudinal fibres, Müller's muscle being relatively small or absent. An eye from which Müller's circular fibres are absent can focus upon near objects only by elongation of the eyeball, particularly of the vitreous chamber. Experiments upon domestic animals as well as upon monkeys have proven that myopia may thus be artificially produced by confinement of these animals in constricted spaces where vision is restricted to short ranges. It does not seem illogical to assert that the same causes may act upon the human eye in its formative years, when the posterior displacement of the ciliary muscle is taking place, especially if we may assume the absence of Müller's circular fibres.

These morphological facts prove, I believe, that myopia is a reaction of form to function, but they do not answer many of the problems that arise in connection with it, such as its predilection for certain individuals and races and its transmissibility. For these answers we must search among phylogenetic stimuli.

It is fairly definitely established that all races of mankind may be divided into two broad and general types. The first is the lateral type in which the lateral lines of the body are far apart and the head is brachycephalic, the extreme length not exceeding the extreme breadth by a greater proportion than 100 to

80, while the difference may be less. The second is the linear type in which the lateral lines are close together and the head dolichocephalic, in which the extreme length to the extreme breadth is in a proportion greater than 100 to 80. It is not improbable that brachycephaly and dolichocephaly have a selective survival value though several observers maintain that the types are due less to hereditary differences than to differences of environment—due particularly to the action of the environment upon the thyroid gland, in other words, that these types are the result of either a slow or fast rate of development and are growth reactions. But even these, if they are to produce permanent variations, must fall under the laws of adaptation and selection. Further, it is not only of the purely osseous structures that we can predicate these growth reactions, the scleral coat of the eyeball also probably responds to similar influences for it may be considered morphologically a part of the osseous system.

At the present time these two types dolichocephaly and brachycephaly occur among all people, some races showing a majority of one type and a few of the other, and other races the opposite. As instances the English is largely dolichocephalic and the German brachycephalic.

Investigating the presence of myopia among these two types we find it far more prevalent among the brachycephalic than among the dolichocephalic, as we find hypermetropia more prevalent among the dolichocephalic. There are, of course mixed types, that is narrow heads with myopia and broad heads with hypermetropia and these are met with among individuals who have sprung from parents of opposite types, commonly from race mixtures.

Tracing these types among the very earliest remains of man we come upon a curious and perhaps significant fact. The skulls of the primordial Pittdown Neanderthal and Heidelberg remains are dolichocephalic, while the skulls of the Cro Magnon, a later and higher development and nearer morphologically to modern man, are brachycephalic. The former left behind them a very simple and crude artistry in flint, while the latter is associated with a highly complex and comparatively excellent decorative art that has required a far more powerful and sustained accommodative effort. In these modern days one of the most typical dolichocephalic races the English aristocracy, is an outdoor and sport loving people, little inclined to confining occupations and to a marked degree free of myopia, while the German largely brachycephalic and addicted to closely confining art and industry is peculiarly susceptible to myopia.

A recent investigation made by the author appears to substantiate these arguments.

Four hundred and forty cases of myopia and hypermetropia in individuals between the ages of fifteen and thirty of both sexes were measured for dolichocephaly and brachycephaly, and their pupillary distances taken.

Myopia 220 cases	hypermetropia 220 cases
brachycephaly 178	dolichocephaly 193
dolichocephaly 42	brachycephaly 27

800 pupillary distances (Dr Losey) made in myopia and hypermetropia without regard to type of skull showed no appreciable divergence.

In my own 420 cases the results are as follows:

In myopia with brachycephaly	p d. 64.25 mm.
In myopia with dolichocephaly	p d. 60.66 mm.
In hypermetropia with dolichocephaly	p d. 58.50 mm.
In hypermetropia with brachycephaly	p d. 62 mm.

The above arguments appear to prove two important facts:

1 That the human eye is liable by its structure and development to the production of myopia but that while myopia is a reaction of form to the demands of function its causes cannot be found wholly within the eye itself.

2 That myopia, while hereditary, is a growth reaction, similar in etiology to the growth reactions, probably endocrine in origin, that have led to racial characteristics.

Certain features of the brachycephalic skull may be secondary factors in the development of myopia, such as the increased separation of the orbits and the wide pupillary distances. These placing an undue strain upon convergence are counteracted probably by a tendency to parallelism of the optic axes. It is a well-known observation that in myopia the angle alpha usually is reduced in size and may be zero or negative in value. If to this we add the absence of Müller's circular fibres we may more readily conceive the development of myopia in the brachycephalic skull.

The morphological facts briefly outlined in the beginning of this paper, together with the intensive cerebration of man furnish also, I believe, the basic cause of presbyopia.

In the lower animals the ciliary body lies in direct contact with the spherical crystalline lens and in the accommodative act the latter bulges anteriorly or is displaced bodily. In a few animals the cornea as well takes part in accommodation by being rendered more convex and even projecting beyond the plane of the eyelids, an aid in accommodation denied to man. In the search for food and as protection against the approach of enemies the dual purpose of vision in the lower animals, the accommodative

apparatus is a perfect adaptation of form to function. In the human infant, likewise, the spherical lens with its closely approximated ciliary muscle is sufficiently adapted to its simple ocular needs. With the posterior displacement of the ciliary body and the resulting flattening of the lens the accommodative apparatus can no longer keep pace with the visual requirements demanded by the artifacts of civilization. The ciliary body in man is far more powerful than in the lower animals by having a fixed point of origin anteriorly, but this power cannot be extended fully upon the lens which having become more and more flattened has lost gradually its ability to increase its convexity in the act of accommodation. This bears out our observations that the physical accommodation of the lens diminishes more rapidly than the physiological capacity of the ciliary body. Though it is unquestionable that the ciliary muscle with the passing of the years loses, as do the muscles in every part of the body, a portion of its early vigor, it is undoubtedly true that presbyopia is largely caused by changes in the crystalline lens, discoverable not only in its gradual sclerosis but also in its loss of spherical contour.

As myopia is one price paid by man for his high mentality so also another is presbyopia. Primordial man, with his low grade mentality, evidenced not only by his morphological characteristics, undeveloped foreheads and diminutive frontal areas, but also by his simple and crude artistry, found, no doubt, his accommodative apparatus sufficient for his needs, as does the human infant today. It is a curious anomaly in man's evolution that structure has developed harmoniously with physical needs, but has not reacted as perfectly to his mental progress. The accommodative apparatus in infancy, not only of the race but also of the individual, is adapted to the limited demands placed upon it. Somewhere in the dim ages of primordial man cerebration was stimulated and while mental development rapidly has progressed, due probably to the prolongation of infancy and childhood, the necessary physical reaction has not kept apace.

#### DISCUSSION

Dr Alexander A Duane, New York City. Dr Vandergrift's paper presents several points of considerable interest, notably his important observations on the relation between myopia on the one hand, and brachycephaly and dolichocephaly on the other. I have time to refer to only one or two of the other points mentioned.

He thinks it possible that in infants, who

cannot accommodate by making the lens more convex, the effort to secure clear vision may result in an elongation of the eye, so that better focusing is obtained. I myself think it not unlikely that in this way, first a transient, then a permanent elongation of the eye may take place. It may be said in passing that in these subjects a very slight elongation would suffice to cause a considerable effect. For while in adults an elongation of 1 mm represents an increase of 3 D in the refraction, in the infant it would represent a change of about 5 D.

I gather that Dr Vandergrift thinks that an elongation of this sort would occur particularly in eyes in which Muller's circular fibres are absent and which, therefore, according to one hypothesis, are destined to become myopic. But this seems to me very doubtful. The idea that absence of the circular fibres of the ciliary muscle is the anatomical basis of myopia is founded on the well-known researches of Iwanoff. But that these changes, if they do occur regularly in myopic eyes, can be the cause of myopia is disproved by the anatomical investigations of Merkel and others, who found the fibres present in a number of new-born infants, some of whom certainly would have become myopic later. It is disproved also and more clearly by clinical observation. For nothing is more certain than that in childhood and youth those who are myopic 10D or less and not a few who have a myopia of over 10D have fully as great an accommodative power as emmetropes and hyperopes of the same age, and accordingly must have as fully developed ciliary muscles. The observed paucity of the circular fibres in the myope, then, must be the result, not the cause of the refractive condition—being, in fact, the expression of an atrophy from disuse. That even this regularly occurs seems to me very doubtful in view of clinical experience which shows that even after years of under-correction a myope of 30 or 40 years may still show full power of accommodation.

The development of myopia is a complex process, i.e., it is not due simply to the elongation of the eye taking place in childhood. To understand the process we must compare the eye of the adult with that of the new-born infant. The former consists of a refractive system—cornea and lens—whose principal focal distance is not far from 21 mm, with a receptive screen (retina) which may be at the principal focus of the system (in emmetropia), in front of it (in hyperopia), or behind it (in myopia). In such an eye every millimetre of elongation of shortening represents a change of 3D in the refraction. In the infant the refractive system has a much shorter focus—about 16 mm. In

this case every millimetre of elongation or shortening represents a change in refraction of 5D. Usually in such an eye the receptive screen (retina) is a very little distance (about 0.5 mm) in front of the focus, so that the eye is hyperopic 2 or 3 D. Such an eye is really so short that if its refractive system were like that of the adult eye it would have a hyperopia of 24 D. We may thus say that the eye of the infant combines a lenticular myopia of high degree (20 D or more) with an even higher degree of axial hyperopia. As the eye develops, the lens, undergoing the changes which Dr. Vandergrift has pointed out, flattens, so that the lenticular myopia diminishes and at the same time the eye elongates, so that the axial hyperopia also diminishes. Usually the axial hyperopia diminishes faster than the lenticular myopia, the net result being that the eye tends to become emmetropic or, as we know, often overshoots the mark and becomes myopic. The part that accommodation plays in this process is not quite certain, but the beneficial

results obtained by the full correction of myopia in childhood indicates that accommodative effort retards rather than accelerates the development of myopia.

As regards presbyopia there is one fact that should be carefully noted. It is commonly assumed that the progressive diminution in accommodation which constitutes the process is due solely to the increasing rigidity of the lens—the power of the ciliary muscle remaining about the same. In other words it is held that at 40 and 50 the ciliary muscle is capable of acting as powerfully as at 20, and the only reason it does not produce the same effect as at that age is that the lens refuses to expand. Now researches that I have detailed elsewhere seem to afford convincing proof that at the presbyopic age the ciliary muscle cannot put forth anything like the power that it exerts earlier and that, in fact, ciliary accommodation and lenticular accommodation diminish progressively together.

## A BRIEF REVIEW OF CERTAIN MECHANICAL CONSIDERATIONS IN THE TREATMENT OF MENINGITIS \*

JAMES B. AYER, M.D.

BOSTON, MASS.

THE factors of chief concern in a study of meningitis are as follows: (1) the type and virulence of the infecting organism, (2) the origin of the infection, and its pathological sequence, (3) the nature of therapeutic agents and how and where applied.

Much has been written on the bacterial aspects of meningitis, and the general conclusions which may be fairly deduced are as follows: meningococcus meningitis alone is amenable to treatment, and this disease still presents a 20 per cent mortality, meningitis caused by a variety of organisms of slight virulence are self-limited and tend to recover, pneumococcus and streptococcus meningitis, hematogenous or secondary to foci such as otitis and brain abscess, are almost always fatal.

The subject of this paper is to consider certain characteristics of the cerebro-spinal fluid pathways in relation to the course of meningeal infection which underlie the treatment of all forms of meningeal infection.

*Sequence of pathological changes in meningitis.* Infecting organisms gain entrance to the meninges in two ways: (1) through the blood stream, and (2) spreading from a focus of infection. In either case clinical, pathological and

experimental evidence<sup>1</sup> all point to the cerebral meninges as first involved, with the exception of rare cases in which the spinal meninges have been invaded by direct extension from vertebral or paravertebral foci of infection. Having gained the subarachnoid space, the organisms spread with great rapidity throughout the whole subarachnoid space, so that in most cases we are dealing with a cerebro spinal process almost from the start. The arachnoid membrane appears to be the first tissue to react to this invasion, but blood leucocytes also appear promptly, and within 24 hours a thin purulent fluid with extra-cellular organisms is evidence of generalized infection. By 48 hours the character of the infection has already begun to change, the exudate is thicker, from increase in pus and fibrin. The organisms begin now to penetrate the deeper layers of the pia. Very soon we find infection no longer confined to the subarachnoid space; invasion of the nerve tissue underlying the pia in places causes a marginal infection, exudate is seen in the perivascular spaces presumably traveling upward from the subarachnoid space, and from these infected perivascular spaces deeper portions of the nervous system come into the zone of infection. In a varying amount of time but in some cases very early, exudate is found in the ventricles, and spreading through the open-

\*Read at the Annual Meeting of the Medical Society of the State of New York, at New York City, May 23, 1923.

dymal lining the organisms set up a periventriculitis

If death has not occurred during the period of rapid dissemination of the infection, a tendency to localization is now seen. Exudate tends to stick in foci of the subarachnoid space. Certain areas are found more commonly involved than others, notably the deep sulci of the brain, such as the Sylvian fissure, the cisternæ at the brain base, especially the velum medullare where the foramina of Majendie and Luschka become obstructed, also the spinal meninges just below the foramen magnum and at the thoracic level. The consequences of these multiple residual areas of infection are numerous and form the tragic after-effects of non-lethal meningitis.

*Therapeutic Considerations.* Surgery requires that where pus exists it should be evacuated. Surgery also employs antiseptics. Theoretically we should like to drain efficiently the infected membranes and irrigate all of the meningeal recesses with strong antiseptics. Unfortunately, neither of these principles can be applied, thorough drainage cannot be established without removing all of the bony coverings of brain and spinal cord, and antiseptics of all kinds have thus far been shown to be detrimental to nervous tissue.<sup>2</sup>

Although we cannot gain entrance to the subarachnoid space at any place we wish, it is possible to reach it at a number of points other than by the traditional lumbar route, and the employment of double or multiple approach offers an opportunity for drainage and irrigation which has hitherto been generally neglected. Furthermore, these little used routes give admittance to the cranial fluid pathways, and it is here that the battle for life or death is determined. Routes other than the lumbar which are of proved value and safety are as follows:

(1) *Ventricle puncture.* First brought into prominence by Cushing and Sladen<sup>3</sup> in 1908, ventricle puncture has unquestionably saved a number of lives. The writer has had two patients in whom the administration of serum by ventricle puncture apparently determined the favorable outcome of treatment. Two methods of approach to the ventricles are employed, puncture through the cortex, and puncture of the corpus callosum. In infants the method is so much easier than in adults, requiring no trephining, that it has become the method of first choice by Howell and Cohen<sup>4</sup> whose figures in meningococcus meningitis are better with serum administered by the ventricular than by the lumbar route.

(2) *Cortical Subarachnoid puncture* has been employed for the introduction of serum<sup>5</sup> and by tet to only for irrigation, when combined with a

tioned. \* another locus of the subarachnoid  
He thinks it ter has used this route only on  
a man dying from tubercular

meningitis, irrigation from the cerebral subarachnoid space over the vertex to the cisterna magna was readily performed.

(3) *Drainage of the Cisterna Magna.* Puncture of the cisterna magna. Frequently the most important point of access to the cerebral meninges is here. Experimental evidence both in this country and abroad points to the cisterna magna as the distributing centre of the cerebrospinal fluid. In 1912 this conception was grasped by Haynes and Kopetzky<sup>6</sup> who devised an operation for drainage of the meninges at this point, an operation which, because of a few unsuccessful trials, seems to have fallen into undeserved disrepute. In this connection it is interesting to note that in 1917 Anton and Schmieden<sup>7</sup> reproduced this operation, claiming originality for it, and Schmieden and Scheele<sup>8</sup> have used it for drainage of infected meninges.

Puncture of the cisterna magna<sup>9</sup>, without operation, has been used by the writer for over three years, and 350 such punctures have been made without accident at the Massachusetts General Hospital. This route may be used for the introduction of serum, and may be a life-saving measure, as in a case of Mitchell and Reilly<sup>10</sup> in which there was a block in the spinal fluid pathways. The writer has had success also in a case of staphylococcus meningitis with spinal block by drainage at this point.

Combined with lumbar puncture below and cortical subarachnoid puncture above, opportunity to irrigate the meninges is offered, provided that the irrigation is attempted before blocking has occurred. It would seem that irrigation from cisterna to lumbar sac would merely wash the spinal subarachnoid space, that a very considerable irrigation of the cerebral meninges is also accomplished was shown by the writer on cadavers, and also by the appearance post mortem of a brain following such irrigation. This cerebral lavage following cisternal-lumbar irrigation was also noted by Eagleton.

Cisternal-lumbar irrigation with Ringer's solution has been employed by Selling<sup>11</sup> in two cases, by Eagleton<sup>5</sup> in three cases, by Crothers<sup>12</sup> in one case, and by the writer in seven cases. Although only two of these patients lived—one a case of meningococcus meningitis, the other of unknown etiology (possibly aseptic meningitis)—all of the operators testify to the simplicity of the procedure, and its efficiency as judged by the large amount of pus removed.

(4) Other methods of approach have been recommended and used, but with these the writer has had no experience. Cervical and thoracic puncture of the spinal subarachnoid space has had a limited use in France<sup>13</sup>, in Germany, Beriel's sphenoidal puncture of the chiasmatic cistern has been employed by its author<sup>14</sup> and by Eskuchen<sup>15</sup>.

### Indications for different methods of treatment

By a review of the foregoing sketch of the pathological sequence of meningitis, the indications for the different methods of treatment become apparent, we must gauge our treatment by the stage of infection, the criterion being whether the fluid pathways are open or blocked.

Because of proved value it is reasonable to treat meningococcus meningitis with serum by the lumbar route so long as the fluid pathways remain

Diagram to show (1) regions of subarachnoid space in which meningitis block is frequently found (black shaded areas) (2) needles placed in lumbar cisternal and cortical subarachnoid space, and in lateral ventricle points of approach of proved value in the treatment of meningitis block, (3) cortical and spinal subarachnoid space which can be reached by combined anterior lumbar irrigation before block occurs (dotted areas)

open. If the spinal subarachnoid space becomes blocked with exudate, resort should be had immediately to the cisterna, the ventricles, or the cortical meningeal spaces, and all of these loci may be employed together or in sequence in an attempt to drain or to administer serum efficiently.

In other forms of meningitis for which we have no serum, and in which the mortality is so great, we know from experience that lumbar drainage and even cisternal drainage is entirely ineffective. If taken early, and frequently repeated, it is possible that irrigation as described may prove of value.

The writer is quite aware that other useful measures may be employed than are mentioned in this short paper, the intravenous administration of anti-meningitis serum so correctly advocated by Herrick, the evacuation of foci of infection such as brain abscess, and tying of an infected jugular vein, so necessary in certain cases, these measures are accessory, even though they may determine the favorable outcome of the case, but in no way conflict with the main thesis of this paper, which is that we should treat meningitis in a manner as nearly surgically correct as is possible.

## NARCOTIC DRUG ADDICTION—SOME MISCONCEPTIONS AND SUGGESTIONS

S DANA HUBBARD, M D

NEW YORK CITY

EVERY now and then, some lay writer, always, as we have observed, more or less conspicuous, but lacking information, knowledge and experience, except in a certain slant, "*breaks into print*" with a "sob story" in behalf of a so-called "Martyr to Mercy"

The drug addict, so far as my information goes, does not burst into print in his own behalf, but it is always through "a friend"

Now in all sincerity, is this publicity service? Does it not injure both the cause and the individual in whose behalf this topic is discussed?

What does it matter to the drug addict whether his affliction be a "disease" or the sequel of a "habit"?

What interest has the public in drug addiction aside from its economic and social consequences?

What interests have the professions, especially medicine and pharmacy, in narcotic drug addiction, save in curing the affected and escaping the blame for its occasioning?

It is believed that the public wants the truth about this matter. It is believed that the Press desire to give the unbiased truth, if it is possible to find such fact.

It is equally true that interested individuals, most often with a reason for their interest, will never give the whole truth and nothing but the truth, as long as this truth may occasion "hurt, harm or hindrance," as dear old Blackstone says about nuisances

Now, what is the truth?

Behind narcotic drug addiction there is but one reason. It is a dark, sinister, death-defying reason, and the basis of many a family disagreement, a parting of husbands and wives, mothers and children and of business associates, etc., it has produced crime and has been the foundation of many a murder—it is *Money*

I became interested in narcotic drug addiction early in 1919. I had heard about a special cure as early as 1891, when a special treatment with Belladonna and Hyoscine was under trial in Bellevue Hospital, but took no special interest in the controversy

We saw the birth of the Harrison (Federal) Narcotic Law, and strange to relate, while this law is widely known by the above title, it is really the making of the Hon. Hamilton Mabie Wright, who might be termed the parent of this regulation

This regulation went along like most laws, exciting no special interest until through court interpretation it was found that the practice of certain physicians was open to question. The court was asked to interpret what was a *prescription* within the meaning of the statute

This, together with some other correlating decisions, put some teeth in what was usually considered an ordinary revenue producing Federal statute

As before mentioned, the Federal officials invaded the jurisdiction of this territory by arresting some doctors and druggists who were apparently violating the provisions of this subtle statute

These arrests threw a number of drug addicts—who had been accustomed to obtaining their daily supply through these two sources—out of reach of obtaining their drug. This occasioned, if the press reports are true, a "young panic."

The then Commissioner of Health, Dr. Royal S. Copeland (now U. S. Senator from New York), had his attention drawn to this by the writer and was informed that here was a splendid opportunity to study first hand this matter. That the facts which could be gathered would be scientifically helpful to the addict, to the police, to the Federal authorities, and to the medical profession as well as to the community

As later events demonstrated, the facts were somewhat revolutionary in character. Studied through clinic and hospital, with no single individual capable of smothering or covering the facts as detected, they can be accepted as the findings of a number of persons working independently of one another and all finding one practical conclusion

To explain we will ask some questions

Is drug addiction a medical problem? No

Is drug addiction a menace? Yes

The New York City Department of Health, Dr. Copeland, Commissioner of Health, and unanimously advised by a committee of influential medical men, none of whom individually were narcotic prescribers, concluded "that the habitual use of cocaine, opium or their derivatives, except as administered, prescribed, or dispensed by a physician, is hereby declared to be dangerous to the public health and safety" (S. C. 135 b)

Is drug addiction a police problem? Yes

What makes drug addiction a police problem?

The entire history of narcotism is intertwined with crime. The seed of this vice was planted here unseen and unnoticed. Its roots grew deep down in the underworld. People in general, ignorant of its malignant growth, unconscious of its proximity as it crept closer and closer, passively viewed its development and deemed it unnecessary to discuss the question at all. The belief is widespread that drug addiction owes its existence to careless medical care or was incident to various bodily ills. Now as a fact, at least so

far as 18,000 known narcotic drug addicts have revealed, nothing is more remote from the truth.

It is thus practical to demonstrate that narcotic drug vice is a police question.

The statements of addicts are tinged with selfish motives; addiction is a secret habit, excuses are sought to justify the practice and all addicts hate to face the cold light of truth.

Narcotic drug addiction is a great problem, but let us face the facts as a problem and without personalities, opinions, peculiarities or warped or twisted conclusions.

What matters it if narcotic drug addiction be a "disease" (a pathological entity, or a physiological dysfunctioning) or the consequence of a habit which becomes sinful when it physically and mentally disables and converts a sane, normal, producing individual into a moral coward, a parasite, a criminal, a serf, held in bonds that grip with chains his freedom and dethrones his mental reasoning.

Too late the mind realizes and the body recognizes that the indulgence in this drug (or its derivatives) has fastened its talons deeply into his being, that here is a demon, whose cravings cannot be denied without cold heads of sweat covering the body, intense pains in the form of cramps racking his flesh, vomiting and purging his bowels, depriving his body of all nutriment, with depression amounting in some instances to collapse. The flesh cringes, the nervous system is whipped there is mental chaos. It is only a question of time when the mind obsessed surrenders.

The number of addicts?

Let us be frank. No one knows. One per cent of the population is too high, 32,000 registered (when it was required by law) in New York State.

Many statements about the number have been made only later to learn that we were misinformed and our conclusion in error.

But if statistics furnish facts, we know the following:

From Geneva we learn that there is annually produced about 3,000 tons of opium. Normally ordinary opium (Chinese) makes 9% morphia, the normal dose of which is  $\frac{1}{8}$  grain, and Persian and Turkish opium makes 12% morphia. It is the latter that is imported into the United States.

It has been learned that only 500 tons of opium is necessary for the legitimate needs of the medical and scientific professions of the world.

Therefore, 2,500 tons annually go astray—probably to channels which supply illicit drug users.

To which information we would add our local New York experience that the known customers of narcotic peddlers, based upon police statistics

amount to 10,000. It has been estimated that 95% of these customers use an average of ten grains of Heroin (Diacetate of Morphia) daily each. From this we know that 76,041 ounces is the yearly consumption used by criminal addicts here in New York.

The legitimate channels of this industry furnishes no light on this problem as the narcotic drug addict draws from the smuggler, the illicit dealer and the crook for his supply.

However, some statistics here furnish interesting information. United States Revenue records inform us as follows regarding importation and exportation of opium and its derivatives:

Year	Pounds Imported	Pounds Exported
1917	64,327	2,438
1918	159,621	5,233
1919	730,272	110,972
1920	211,360	127,248
1921	101,668	3,480
1922	148,234	250
1923	114,407	Figures not available as yet

It is enlightening to observe that when the Federal authorities became active in 1919, when the courts interpreted the Harrison law and which gave teeth to bite the narcotic drug prescriber and dispenser, the importations dropped from the enormous total of 730,272 pounds in 1919 imported down to 114,407 pounds in 1923.

It is also interesting to observe, because it was formerly suspected that neighboring countries to the south and north were used illicitly to export this material and then smuggle it back for purveying to the drug addict through the peddler and here in 1919, 110,972 pounds were exported chiefly to Canada and Mexico, which traffic under careful supervision rapidly shrunk to a meagre 3,480 pounds in 1922, and only 250 pounds in 1923.

This talon of the devil fish had evidently been amputated by the wise provisions of our legislation effected at Washington in this connection.

Now if the 2,500 tons above the needs of medicine and science can be accounted for, we can account for the number of drug addicts throughout the world.

What is a drug addict?

Various definitions have been attempted but the most practical is that given by the advisory committee to the Commissioner of Health of New York. "A drug addict is one who uses habitually a narcotic drug for the comfort such indulgence affords, and who has no illness or other legitimate reasons for such practice."

No individual suffering from any disease—cancer, tuberculosis, locomotor ataxia, etc.—and

which is accompanied by pain, misery or physical discomfort, should be classified as an addict. The Federal authorities accept this interpretation and their agents act accordingly.

No physician, who is practicing his profession "in good faith," to use the words of the statute, need hesitate to aid his patients, so far as they need relief from pain, by the use of opium or its derivatives (Morphia), by prescribing as the needs of the case demand, whether for small or large amounts or for a single dose or a number of doses.

The statute was never intended to interfere with the proper practice of medicine, though some timid physicians have hesitated to prescribe these drugs for any length of time fearing embarrassment or notoriety. Such gentlemen need have no fear because if they desire they can secure "permanent exemption" of their patients—with documentary permission—through application to the head of the local narcotic unit, on presentation of such facts.

It is manifestly fair and in decent co-operation that Federal officials should be informed of these cases that they may act intelligently and the medical profession saved annoyance, through publicity or supervision.

Is There a Need for a State Supporting Statute?

Unquestionably the answer is YES.

To quote an extract from a prominent and well informed Federal official (U S P H S): *"A State Law conforming strictly to the Federal law would, no doubt, be a good thing"*

The Federal act puts it up to the physician in few, well selected words—*"Practicing his profession IN GOOD FAITH"*—the language is simple, it is clear, and it is comprehensive. Nothing could be better.

It is unfortunate that doctors prostitute their noble calling by prescribing to drug addicts opiates simply to supply them with their drugs which is taken to comfort them and for which there is no other reason and this "for a consideration" (sometimes as has been stated in court, as low as twenty-five cents for a prescription).

In one instance in which the doctor and the pharmacist were tried and convicted it was shown that the physician wrote nearly 200,000 prescriptions in a brief period, and in every instance his orders were filled by the same druggist with whom he had a splitting agreement as to the proceeds. These individuals are sojourning in Atlanta and they are examples to all who forget their Hippocratic Oaths and debase the sanctity of their noble profession. Without harshness of intention, they deserve all that they got.

Now how many doctors are drug addict prescribers in New York, and is this a safe index of the practice throughout the country?

The question should be "were" instead of "are" because as a result of the prosecutions the *trade* is narrowed down to the minimum limits of a negative.

In 1919 when there were arrests and later prosecutions and the New York Clinic was opened, of some 7,464 drug addicts carefully interviewed and whose histories were taken by welfare workers who volunteered for this purpose from the church organizations and who made every honest endeavor to get the truth, it was found that only 55 doctors were engaged in this practice in this city.

Fifty-five "script" doctors among 15,924 duly licensed physicians.

Is it any wonder that the medical profession take exception to the indictment that physicians were responsible for this unsavory condition?

Now where are these 55?

Twenty-eight were indicted and 20 were tried and all convicted except 3. About 5 pleaded guilty as charged. Several are awaiting trial. One of these is the Sick martyr, whose trial has time and again been called but postponed on account of request of counsel stating his client was desperately ill and who offered physicians' affidavits as to the physical condition of his client.

Now is it not unfair, un-American, to propagandize against the government?

The government has never tried its cases in the Press. The government evidently had the evidence or no jury would have indicted. Having been indicted, is it not wise to suspend judgment until the case is tried and judgment given?

Our motives are in the interests of justice. We believe in a square deal—a square deal for the addict and an opportunity to morally and socially rehabilitate himself. An opportunity which is denied him when anyone provides him with narcotic drug to be used solely for the comfort such drug gives and which with continued use debauches and prostitutes a human being.

Let us be fair.

The drug addict can be cured, safely, surely and without danger. The cure administered is quick. It is almost specific. It is no secret. It can be applied by any honest physician. But the addict must be under control and beyond the reach of misguided friends or subsidized agents surreptitiously supplying the drug against the advice and counsel of the physician.

Three thousand addicts were successfully de-narcotized at Riverside Hospital without a fatality or a single complaint in a humane and comfortable fashion. Kings County Hospital, Sing Sing prison, and the Federal Penitentiary at Atlanta and Leavenworth can further attest to these facts, and to state to the contrary leads one to infer that motives sinister and self-interested are behind one's conclusions.

The drug addict must go

In New York City our sanitary code takes up where the Harrison law leaves off—"the unauthorized possession"—and we hear no outcry against the operation of this statute.

In New York State we need a statute to the same effect. Let us have one. When the public know and appreciate what and who is behind this agitation the sinister influence will be

scotched, and we will have a law that will make the state police active as the local police of New York are, and then, we will hear no more about 'ambulatory treatment,' 'narcotic drug disease,' and such phrases.

God speed the day and save the poor addict. He needs to be saved from himself and his friends.

### SORE THROAT FOLLOWING TONSILLECTOMY

ALEXANDER C. HOWE, M.D., F.A.C.S. and M. SCHMIDT, M.D.  
BROOKLYN N. Y.

IT has been our occasional observation that a patient whose throat has apparently healed following a tonsillectomy complained afterward of a sore throat for an unusual and unexplainable length of time. The time which we normally allot to this complaint varies between two and ten days. When, however, they complain bitterly for one to three months, some explanation seems in order. There follow three case reports.

**CASE 1** A married woman, age forty, who on April 11th complained of having had a sore throat for three weeks.

Examination showed a left retro-tonsillar abscess which was surgically drained at this time. The cavity was cleaned with peroxide and the acute subjective symptoms disappeared, but on May 22nd the opening through the pillar had not closed, the tonsils were both very evidently infected and the throat felt uncomfortable. Tonsillectomy was performed under local anesthesia on May 26th.

Convalescence was as usual, except that on the 13th of June, eighteen days after the operation, she complained that her throat was still sore. On June 23rd, approximately one month after the operation, the throat was still sore and she said that during the past four days, fluids which she swallowed passed through into her nose.

Examination showed a circular perforation of the palate, just to the left of the mid line, about one centimeter in diameter which communicated directly with the nasopharynx.

Mixed treatment was instituted and a blood Wasserman showed 3 plus.

A course of neo salvarsan was given and followed shortly by cessation of the subjective throat symptoms and gradual closure of the perforation in the palate.

**CASE 2** A married woman, age thirty five, on October 27th complained of recurrent attacks of tonsillitis.

Examination showed the tonsils to be small but full of pus and poorly drained. Tonsillectomy was performed under local anesthesia on November 14th.

Her throat had healed in two weeks and to all appearance should have caused her no concern. On December 21st, thirty eight days post-operative she still complained of a sore throat. At

about this time, areas of a dull red color, about 5 cm. in diameter, sufficiently tender to cause the patient discomfort and alarm, occurred over her shin bones and lower arms. A blood Wasserman taken at this time was positive and following a course of salvarsans, her throat symptoms together with the skin lesion entirely disappeared.

**CASE 3** On December 8th, an unmarried woman of forty years stated that she had a tonsillectomy performed under local anesthesia one month before and that her throat was still sore, so that she could not swallow with comfort.

Examination showed that her tonsils had been completely removed and the pillars not injured. The throat was perfectly healed.

She also complained of nasal obstruction and post nasal discharge. A very large posterior tip of the right inferior turbinate was removed with practically entire relief of the nasal symptoms. The throat, however, still remained very sore. During the first week of January, or over two months post operative, she complained so bitterly of a sore throat that a blood Wasserman was taken and found to be positive. A course of salvarsans gave her prompt relief.

Cases of chronic sore throat with no apparent local lesion have been recently reported by Medalie<sup>a</sup>, Koening<sup>b</sup>. These were unsuccessfully treated by local measures. However, on finding that they had positive Wasserman's, specific treatment caused relief.

**Summary**—Cases of chronic sore throat with no local signs have been reported to be of specific origin.

Three cases are here reported of chronic sore throat following tonsillectomy. All of these cleared up with specific treatment when local measures had failed.

Persistent sore throat with no apparent local lesion should always suggest a Leutic etiology.

In so far as the average case of tonsillectomy has ceased to complain of pain in the throat within ten days, it may be advisable to suspect any case that complains for more than two weeks.

## WHY HAVE RE-REGISTRATION?

The suggestions are often made that re-registration is not necessary for the effectiveness of the proposed Practice of Medicine Act, and that county societies and county clerks can supply a list of all legally enrolled physicians. Every physician has registered with a county clerk, and some have registered with several clerks. "Why not," it is asked, "copy the lists from the county clerks, have the secretaries of the county societies certify to those physicians whom they know, and have an additional canvass made to find those who are practising without registration?" The Medical Society of the County of Kings is putting this plan into operation and giving it a thorough trial, but the trouble is that *the findings will have no official standing in court*. The canvass is made by volunteers, and is incomplete. No canvasser can swear that the list of his section has included every person who is entitled to practice medicine.

Suppose a person is brought to court on the charge of practising medicine illegally. The first

thing to be proved is that the defendant is not a legal practitioner. The law will give the defendant the benefit of the doubt, and the court will be compelled to assume that he is a legal practitioner, unless the prosecution proves that he is not. The prosecution may show that the defendant is not registered in a particular county, but there are sixty counties in which he *might* be registered. The defendant does not even have to state that he has not graduated from a recognized medical school—it is the duty of the prosecution to prove that he has not graduated from *any* of the eighty medical schools of the United States, to say nothing of those in other countries. The burden of proof is on the prosecution.

The re-registration part of the Practice of Medicine Act provides for the creation of an authoritative list of legal practitioners of medicine by making a personal registration in the Regent's office a pre-requisite to the practice of medicine. There will be only one list to consult, and absence

from that list will be sufficient to prove incompetency to practice medicine. The court will take judicial notice of the list, and all that the prosecution will need to show is the absence of the name of the defendant from the list. One sharp tooth of the proposed Practice of Medicine Act is this provision by which the court must take judicial notice of the registration, or failure to register.

Registration may be illustrated by its comparison with a board of health action against a pig-pen. Under ordinary conditions when a health officer proceeds to force an owner to clean up a pig pen, he must prove the pig-pen to be a nuisance which is unusually annoying to a considerable number of people, and that it

affects their health. A health officer can seldom prove these conditions. But the board of health may officially declare any pig pen in its jurisdiction to be a nuisance *per se* and then all that the prosecuting officer has to do is to prove the mere existence of the pig-pen, without regard to its sanitary condition.

It is the same in regard to proving the lack of qualifications of an alleged practitioner of medicine. If a name is not on the one list, that person has no right to practice medicine. Registration shifts the burden of proof from the prosecution to the defendant. This is the reason for insistence that provision for re-registration shall be retained in the Practice of Medicine Act.

I O

### MEDICAL HOUSECLEANING

Many physicians do not realize the extent of medical practice by those who either have no legal right to the degree of M.D., or, having an M.D. degree, are using it in the practice of rank quackery. The revelations of practices in New York City may probably be duplicated to an even greater extent in smaller places throughout the State, because the public officials and the leaders in Medical Societies in the Metropolis are active in the detection and prosecution of the pretenders, and so the fakers depart for smaller places where the law machinery is functioning less actively. The first duty of reputable physicians is to set their own house in order and prosecute those who are masquerading under false pretenses.

As an example of the assumption of the title M.D. by one to whom it does not belong, there may be cited an article in a popular technical journal, used by boy scouts and high school students as a source of scientific information. This article is written by a man who signs M.D. after his name, although he never received the degree. The article mentions patients whom he claims to have treated. The offense is made greater by the fact that the name of a legally registered physician of the highest class appears in the same issue as the author of a valuable article. If reputable magazines of large circulation lend themselves to exploiting quacks, what can be expected from the daily newspapers who have no time to investigate the credentials of pretenders seeking publicity and notoriety through paid advertisements?

Unscrupulous physicians with bona fide degrees of M.D. sometimes capitalize the methods which fakers have exploited in the daily press. An example is that of a physician whose name is registered with the Department of Health and who is advertising a *newly discovered cure* for

tuberculosis. The principles on which this so-called cure are founded had been announced some twenty years ago in reputable medical journals and had been given thorough tests and had been found wanting, as have all other tuberculosis cures. The daily press had revived in a flamboyant way a public interest in the twenty-year old "Discovery," and a person who evidently has a degree of M.D. has taken advantage of that interest to advertise to use that method as a sure cure of tuberculosis. Reputable physicians are absolutely opposed to dishonesty in all forms, and are anxious to co-operate with the authorities in the prosecution of those who make seductive promises that border on the practice of rank quackery.

Another form of reprehensible medical practice is that of licensed physicians consulting with quacks and protecting them against the results of their illegal acts. A bunch of four quacks, protected by two licensed physicians, has come to the notice of the district attorney who said that their activity constituted the most brazen case of quackery that has come to the notice of the office since the investigation was started.

The legal machinery of the several counties is already sufficient to secure the prosecution of the more flagrant offenders if sufficient thought is given to the problem. One abortionist in New York City was caught and given a heavy jail sentence for signing the name of an unknown disease to a death certificate of a woman on whom he had committed an abortion. Although the evidence was not strong enough to convict the practitioner of the crime of abortion, he was successfully prosecuted for certifying that his victim died of edema of the lungs, nephritis, and *subcarditis*. Since the last term is not recognized in medicine, a conviction followed.

It is too true that there are physicians who prostitute their medical privileges for fraudulent financial gain. While fortunately their number is extremely few, yet their unsavory reputation is embarrassing to the fifteen thousand honest physicians of New York State. The offending doctors are not members of any medical society

and have no more standing with reputable physicians than clerical black sheep have among ministers of the gospel. The members of the scientific medical societies of New York State will unanimously support any measures designed to purify and ennoble the practice of medicine.

F O

## HERE IS A CHANCE FOR REFORM

Connecticut's highly commendable campaign against quack doctors, and its reverberations in other states, almost warrant the hope that success might attend an immediate and earnest attempt to change the medical practice laws all through the country. And no laws need changing more. Thanks to the abysmal ignorance in medical matters which characterizes a majority in our legislative bodies, statute books show how well the quacks have been able to win confidence in the two delusions on the acceptance of which their legal right to do business must rest. The first of these is that nothing is "medical practice" except the administration of drugs, and the second is that there are and must be "schools" of medicine, all equally efficient, and each entitled to bestow upon its representatives the title of doctor.

Not all who believe those two propositions are insane, and not all who uphold one or the other of them is a conscious swindler. But both are grotesquely false, and the legislators who have treated them as true are responsible for the scandals just revealed in Connecticut. They are to blame for the absurd fact that in most of the states there are several boards, each empowered to examine candidates and grant licenses.

This means that several quackish cults can send "graduates" of their so-called colleges and diploma mills before men of like mind who will turn them loose on the public to minister to the sufferers from all kinds of diseases, and in almost every instance to use in dealing with conditions widely different the single expedient—usually some form of suggestion or massage—with which alone they have been equipped.

### *Only One Board Is Needed*

In no state should there be more than one medical examining board, and that one alone should issue licenses to practice medicine. Its members would not belong to any "school." They would be men of real medical education themselves, able to distinguish between a real medical college and a diploma mill—between a real doctor and a quack. They would know that a real doctor is one who has acquired a decent knowledge of all the many means by which disease, by himself or others, can be prevented and cured if curable. They will be ready to use suggestion or manipulation of bones or viscera in cases demanding it—as ready as they are to administer drugs when drugs are needed, or to trust wholly to diet and outdoor life in the not infrequent instances when nothing more is required or can be done with any expectation of benefit.

Not one of the men licensed by such a board would claim universal efficacy for any form of treatment. Whoever does that is instantly revealed as a quack, either ignorant or dishonest, and he is not any the less a quack because he can produce "testimonials" from grateful patients, including the familiar legislator whose close relative was saved from fast approaching death by an "irregular" after he, or more often she, had been given up by anywhere from one to a dozen "regular" doctors.

The number of people, otherwise intelligent, who thus can be deceived and with the best of intentions can deceive others as gullible as themselves, is disgracefully and humiliatingly large.

## MEDICAL NEWS

We have been a little bit worried over the silent acceptance of the new form of THE NEW YORK STATE JOURNAL OF MEDICINE. There has been no flood of either protest or approbation, and we have been wondering whether or not the JOURNAL was being read. We consoled ourselves with the thought that the paper was fitting into the minds of the members of the New York State Medical Society so perfectly that it was considered one of the family whose absence rather than

presence would be keenly felt. We felt that doctors accept the JOURNAL without comment, just as they do their breakfast coffee and rolls, but we had little tangible evidence of appreciation until we received a call from a contributor who told us that he had received over fifty letters of inquiry asking for further information, and then we knew that the JOURNAL was being read and appreciated.

This introduction is merely a text on which to

base a plea for the members to send us items of local news. We are convinced that the JOURNAL is read widely, and that it is an excellent medium for both giving out and getting new ideas. We are trying to establish intimate relations with the local physicians. We run two pages of comment on the news gathered from the local newspapers throughout the State, and we are convinced that there are abundant medical happenings to make several pages of interesting reading every month. We want items sent by physicians themselves—items that reflect the medical thoughts of the physicians. The Daily Press department reflects the medical thought of the editors of the news papers and, to an extent, that of the public, but we wish to set forth the news from the point of view of the physicians.

We are especially anxious to receive news regarding the county medical societies. These societies reflect the civic activities of the physicians. Some publish news letters and bulletins in order to keep their members informed about the societies' activities. (See this JOURNAL, February 29th.) Some societies are taking up civic problems such as, for example, "Hospital Survey of Nassau County" (see this JOURNAL, February

15th, page 179), but we received our information about it through a clipping from a local paper. Such news as this should come to us from the officials of the county medical societies.

We are pleased with the plan adopted by the *Journal of the Medical Society of New Jersey*. That journal has an official reporter in each county medical society, and prints his name at the head of his contributions. The *Journal* uses several pages of local news which the reporters send each month.

The New Jersey plan commends itself to us and we will try to arrange a system of reporting. While the local secretaries are naturally the proper reporters, yet we are aware that few physicians like to "write compositions" now, any more than they did in their school days, and yet every county society contains some member with a literary genius who will write for the same reasons that another plays the piano. We will expect each society to discover and bring to light that dormant writer who can illumine its proceedings and spread their glow abroad throughout the State.

F O

### WHAT IS RIGHT OR WRONG?

Several of our correspondents and commentators have used the words "Principles" and "Right and Wrong" in connection with the re-registration feature of the proposed Practice of Medicine Act. The word "principle" has two shades of meaning.

1 It has a strictly scientific application to the basic facts which underlie a proposed course of action. The *scientific principle* of the proposed Practice of Medicine Act may be stated as follows: *Major Premise*—Treating the sick requires great scientific knowledge and skill. *Minor Premise*—Some healers have neither knowledge nor skill. *Conclusion*—A law is needed in order to eliminate unskilled healers.

The words *right* and *wrong* may properly be applied to the law in order to express the degree of efficiency or smoothness with which the law will accomplish its purpose. If re-registration will afford essential aid in the efficient working of the law, it is *right*, or *proper*, or *desirable*, but if it is unnecessary, or a hindrance, it is *wrong*, or *useless*, or *harmful*. Right and wrong here refer simply to scientific efficiency and have no moral significance.

2 The word *principle* also means a high moral

basis for action. The *moral principle* involved in the proposed Practice of Medicine Act may be stated as follows: *Major Premise*—It is the duty of the government to provide the means for protecting the people from incompetent healers. *Minor Premise*—Registration and fees impose the duty of protection on a few citizens—the doctors. *Conclusion*—The Practice of Medicine Act is morally wrong, and for that reason it will be a failure.

We do not believe that any moral wrong exists in the proposed Practice of Medicine Act, because another fundamental principle is involved. This third proposition may be stated as follows: *Major Premise*—The state may offer and grant special privileges to those citizens who conform to the requirements laid down by the state. *Minor Premise*—Physicians, dentists, veterinarians and others have been granted the exclusive rights to practice their several professions, to their own financial benefit. *Conclusion*—Physicians are *rightly* subject to the rules and regulations which the state may impose upon them.

We recommend a re-reading of the editorial on page 259 of the February 29 issue. F O

# LEGAL

By GEORGE W. WHITESIDE, Esq

## INTERPRETATION OF LAW IN MALPRACTICE SUITS

Our Court of Appeals in a leading case said "The law relating to malpractice is simple and well settled although not always easy of application." The misapplication of the law of malpractice by the trial court may be responsible for a judgment against a doctor in a malpractice case, where under the law and the facts of the case no liability exists. Erroneous verdicts against doctors are given not only because of false or unscientific testimony of a medical expert or because of serious conflicting testimony concerning the treatment of the case, but unfortunately because of the improper application of the law to the facts of the case by the trial judge.

When a trial judge submits to a jury the question of malpractice, he assumes that under some construction of the facts proved in the case, the jury would be justified in finding malpractice in the doctor's treatment. If the court rules under the evidence that there is a question of fact for the jury's determination, the case must then be passed on by the jury and there are immediately introduced at least as many human elements and possibilities of error as there are jurymen. Should the trial judge properly apply the law of malpractice to the facts in the case, every verdict of the jury in such cases would leave open for review on appeal practically no questions of law, but solely the question of whether the verdict is in accordance with the evidence or the weight of evidence. In such a case, when reviewed on appeal, the Appellate Court may find that the jury erred in its decision on the facts and reverse the case and send it back for a new trial.

It is exceedingly important that our trial courts in submitting malpractice cases to a jury for decision, should by proper instruction prevent a verdict based upon speculation, guess or surmise. When the facts are such that there is either no basis for an adverse judgment against a physician or an adverse judgment can be found only by the speculation, guess or surmise of a jury, the trial court should, as a matter of law, refuse to permit the jury to decide the case, but should dismiss it as a matter of law.

These observations are prompted by a decision in a case recently tried by us. The action against the physician centered about the breaking of a needle used in administering a local anæsthetic preparatory to the performance of a tonsillectomy. In the last of a series of injections the needle broke. The physician tried, without suc-

cess, to remove the broken piece, the location of which careful search at the time failed to reveal. The physician went ahead and removed the tonsil in the hope that possibly the broken part of the needle might either come away with the tonsil or its location be more readily ascertained after the removal of the tonsil. The operation being completed, the broken part of the needle still remained in the body of the plaintiff. The physician decided to permit the patient to rest a few hours before he should tell her of the accident. She returned to her home and later the same day the physician visited her and apprised her of the fact that the needle had broken and advised that the X-ray be used at once to determine the location of the broken part. The physician took her to a laboratory that afternoon, X-ray plates were made which disclosed the foreign body somewhere beneath the jaw. The physician made an appointment for the plaintiff to see a specialist where proper methods were employed for the removal of the needle, but without success. Later the plaintiff, at the suggestion of the physician, was taken to a hospital, and under a general anaesthesia, attempts were made by probing to locate the needle. These were likewise unsuccessful. Upon the patient's recovering from the anaesthesia she was informed of the inability of the physicians to find the needle. A free and frank disclosure of the whole situation was likewise made to the husband of the patient. The patient continued to receive attention from the defendant doctor and she made a complete recovery. She later instituted suit against the physician who had had the misfortune of breaking the needle.

There were three specifications of negligence submitted to the jury, first, that the doctor, had he exercised reasonable skill and care, would have given a general instead of a local anaesthetic, second, that the doctor should have known of the breaking of the needle, and third, that he should have extracted the needle or made efforts to extract the needle before he removed the tonsil. At the trial the plaintiff relied largely upon the breaking of the needle. The jury found a verdict in favor of the plaintiff, probably reasoning that plaintiff went into the doctor's office without a needle in her throat and came out with one somewhere hidden in the tissues of her body, which might cause her trouble in the future.

On appeal to the Appellate Court, it was held that there was no basis for the finding of negligence against the doctor by reason of the break-

ing of the needle and that the proofs at the trial supported the contention of the doctor "that the general practice is to use a local anaesthetic instead of a general one in removing tonsils from an adult." The doctor's efforts to remove and extract the needle after it had broken, though unsuccessful, did not justify an adverse decision against the doctor. The court favorably commented upon the defendant for procuring timely assistance from a well-known consultant in an attempt to have the needle removed and said "He showed his anxiety to do everything possible for his patient and did not spare expense to himself." The Appellate Court tersely said "Malpractice was not shown by the fact that the needle broke or that part of it remained in the plaintiff's body." On the question that had been submitted by the trial judge as to the advisability of proceeding with a tonsil operation after the needle broke, the higher court said "The fact that he was unable to locate the needle would not justify the abandonment of the operation." And the court cited as further justification of the doctor's judgment in going on with the operation the fact that with expert help and the use of the X-ray the efforts to remove the needle were unsuccessful. In conclusion the court said "Under the circumstances, we are of the opinion

that malpractice was not established, and that the judgment and order should be reversed with costs and the complaint dismissed with costs."

This decision of the Appellate Court means that there was no case proved at the time of the trial which as a matter of law, justified the sending of the case to the jury for its determination and that on the facts proved as a matter of law, the jury should not have been permitted to speculate, guess or surmise, and that the complaint should have been dismissed by the trial court.

There is perhaps no type of case where the functions of the trial judge must be exercised with greater care so the application of the law to the facts than a case of malpractice. The hazard of medical practice is not entirely confined to the human element of error, omission or mistake on the part of the doctor or to the error in judgment of the jury, but also to the mistake in the application of the law to the facts by the trial judge. These hazards will probably continue to exist, but they need not occasion financial loss or anxiety to the doctor if he avails himself of the benefits of the group insurance plan for malpractice defense provided by the State Society. G W W

### APPENDICITIS—ALLEGED DELAYED DIAGNOSIS

The defendant, a general practitioner, at about eight o'clock one evening was called to the home of a girl, nineteen years of age, who was complaining of severe cramp-like pains throughout the entire abdomen, which pains were not localized at any place in the abdomen. An examination disclosed the temperature and pulse normal the chest negative, and the abdomen distended with gas and tympanic on percussion. On palpation there was no point of tenderness and no masses could be felt. There was no rigidity of the abdominal muscles. A soap suds enema and calomel were ordered also a prescription of salol, natron bicarbonate, and pulverized aromatic codeine sulphate. There was also administered hypodermically  $\frac{1}{4}$  grain morphine and a liquid diet was prescribed, the patient to be kept in bed.

At about 8:00 P. M. of the following evening he was again called to examine the patient. The condition was practically the same as on the preceding day except that she had vomited during the afternoon and had had relief from the enema and prescriptions. There was no increase of temperature or rapidity of pulse, no rigidity of abdominal muscles and no definite point of tenderness. A further enema was ordered and the medication continued, also the application of an ice bag to the right side of the abdomen.

On the following morning at about 8:00 A. M. he was again called to attend the patient. At that time the examination disclosed that there was a slight rise in temperature, though the pulse

was the same as on the preceding days. Palpation of the abdomen disclosed a point of tenderness in the region of the appendix, and rigidity of the abdominal muscles. After this examination he advised the parents that he believed the patient was developing appendicitis and that she should be removed to the hospital. This advice was followed and the patient was taken to the hospital, passing out of the care of this defendant.

After examination at the hospital an appendectomy was performed and a gangrenous appendix removed, the surgeon upon operation found that the appendix had recently ruptured. There were no adhesions and the surgeon's opinion was that the rupture had occurred within six hours preceding the operation.

In an action instituted against this defendant he was charged with failure to use proper care and skill in diagnosing the plaintiff's condition, and because of his failure to diagnose the condition had permitted the appendix to become gangrenous, with the result that she was confined in the hospital and suffered a greater amount of pain than she would have had had the defendant made a proper diagnosis when first called in.

After the case had been on the day calendar for trial, the plaintiff and her attorney, apparently recognizing the hopelessness of their case and the freedom of the defendant from liability, finally consented to a discontinuance. G W W

# LEGISLATION

By James N. Vander Veer, MD

## IMPORTANT NOTICE

The date of the hearing of the State Department of Education Bill (The Carroll-Lattin Bill) has been changed to March 26th

## LEGISLATIVE BILLS

### SENATE

In Re State Institute for the Study of Malignant Disease at Buffalo, New York—Senate Int No 175 (Print No S 175), by Senator Michael E. Reiburn of New York, concurrent Assembly Int No 195 (Print No A 195), by Assemblyman Julius Berg of Bronx County, which would amend section 345, Public Health Law, by placing fiscal control of State Institute for Study of Malignant Disease with State Department of Health

The Senate bill was reported out of Committee on March 6

The concurrent Assembly bill is still in committee

The Legislative Chairman of Erie County had been notified that the Senate bill was reported out

The Narcotic Bill—Senate Int No 1198 (Print No S 1329), by Senator Morton J. Kennedy of New York County, concurrent Assembly Int No 1549 (Print No A 1746), by Assemblyman Morris Weinfeld of New York, still in Public Health Committee in each house

#### STATE OF NEW YORK

No 1329 Int 1198

IN SENATE,

March 11, 1924

Introduced by Mr. Kennedy—Read twice and ordered printed, and when printed to be committed to the Committee on Public Health

#### AN ACT

To amend the public health law, in relation to habit forming drugs, to provide for the control, possession, sale, prescribing, dispensing, dealing in and distribution of such drugs

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," is hereby amended by inserting therein a new article, to be read as follows

### ARTICLE XXII

#### HABIT FORMING DRUGS

- |             |  |
|-------------|--|
| Section 420 | Short Title  |
| 421         | Definitions  |
| 422         | Acts dangerous to public health                                  |
| 423         | Acts prohibited  |
| 424         | Sale on written orders   |
| 425         | Preparations and remedies exempted                               |
| 426         | Professional use of habit forming drugs                          |
| 427         | Prescriptions  |
| 428         | Record to be kept  |
| 429         | Labels   |
| 430         | Authorized possession of drugs by individual                     |
| 431         | Physical examination required                                    |
| 432         | Instruments for injection of habit-forming drugs                 |
| 433         | Exemption from restrictions                                      |
| 434         | Drugs delivered to the State Hospital Commission                 |
| 435         | Notice of conviction of professional man sent to licensing board |
| 436         | Records confidential   |
| 437         | Fraud or deceit  |
| 438         | Commitment of addicts, procedure, discharge                      |
| 439         | Exceptions and exemptions not required to be negated             |
| 440         | Enforcement  |
| 441         | Possession at time article goes into effect                      |
| 442         | Penalties  |
| 443         | Constitutionality  |

§ 420 Short title This article shall be known as the narcotic drug control law

§ 421 Definitions As used in this article

1 "Person" includes any corporation, association, copartnership or one or more individuals

2 "Physician" means a licensed practitioner of medicine as defined by article eight of this chapter

3 "Apothecary" means a licensed pharmacist or druggist as defined by article eleven of this chapter

4 "Dentist" means a licensed practitioner of dentistry as defined by article nine of this chapter

5 "Veterinarian" means a licensed practitioner of veterinary medicine as defined by article ten of this chapter

6 "Medicine" means a drug or preparation of drugs in suitable form for use as a remedial or curative substance

7 "Sale" includes barter, exchange or giving away, or offering thereof and each such transaction made by any person whether as principal, proprietor, agent, servant or employee

8 "Dispense" includes distribute, leave with, give away, dispose of, and deliver to a person or to his agent to be delivered to him

9 "Administer" means only administration by person authorized to administer habit forming drugs

10 "Coca leaves" includes coca leaves cocaine or any compound, manufacture, salt, derivative or preparation thereof, including alpha or beta eucaine, or any of their salts or any synthetic substitute of any of them, identical in chemical composition, but shall not include decocainized coca leaves, or preparations made therefrom or other preparations of coca leaves which do not contain cocaine.

11 "Opium" includes opium, morphine, codeine, diacetyl morphine (heroin) or any compound, manufacture, salt, derivative or preparation of any of them or any synthetic substitute of any of them identical in chemical composition but not apomorphine and its salts

12 "Cannabis indica" or "cannabis sativa" shall include any compound, manufacture, salt, derivative or preparation thereof and any synthetic substitute of any of them identical in chemical composition

13 "Habit forming drugs" shall mean coca leaves opium, cannabis indica or cannabis sativa

14 "Manufacturer" means a person who by compounding, mixing or other process of manufacture, produces or prepares habit forming drugs for sale on written orders and does not include an apothecary who compounds habit forming drugs to be sold or dispensed on prescription

15 "Wholesaler" means a person who supplies habit forming drugs on written orders

16 "The Harrison Act" means the act of Congress, entitled "An act to provide for the registration of, with collectors of internal revenue, and to impose a special tax upon all persons who produce import manufacture, compound deal in dispense, sell, distribute, or give away opium or coca leaves their salts, derivatives or preparations and for other purposes," approved December seventeenth nineteen hun-

dred and fourteen, as heretofore or hereafter amended

§ 422 Acts dangerous to public health Any unauthorized possession control over sale, distribution prescribing, administering or dispensing of habit forming drugs is hereby declared to be dangerous to the public health and a menace to the public welfare.

§ 423 Acts prohibited It shall be unlawful for any person to possess, have under his control, sell, distribute, administer, dispense, or prescribe any habit forming drug except as provided in this article

§ 424 Sale on written orders

1 By whom and to whom sold A manufacturer wholesaler, or apothecary may sell or distribute habit forming drugs only to any of the following persons and upon his written order

a To a manufacturer, wholesaler or apothecary

b To a physician, dentist or veterinarian

c To a public or private hospital

d To a hospital or institution licensed for the treatment of drug addiction

e To a person in charge of a laboratory where habit forming drugs are used for scientific or medical research, but only for use in such laboratory

f To a person in the employ of the United States or of this state or of any political subdivision thereof purchasing or receiving the drug by reason of his official duties

g To a captain or proper officer of a ship upon which no regular physician is employed, for the actual medical needs of the officers and crew when not in port Provided, however, that both parties to the transaction in each of the above cases are registered under the Harrison Act if required by such act to be so registered

2 Order blanks

A written order for the supply of any habit forming drug shall be signed in duplicate by the person giving it or by his duly authorized agent one duplicate of which shall be presented to the person who sells or distributes such habit forming drugs and in the event of his acceptance of such order each party shall preserve his duplicate of such order for a period of two years in such a way as to be readily accessible for inspection and it shall be subject to inspection by any public officer or employee engaged in the enforcement of this article Provided, however, that it shall be deemed a compliance with this sub-section if the person giving the order shall have complied with the provisions of the Harrison Act respecting the requirements governing order blanks under said act.

3 Possession lawful Possession of or control over habit forming drugs, obtained as pro-

vided in this section, shall be lawful if in the regular course of business, occupation, profession, employment, or duty of the possessor and in an amount necessary therefor

4 This section shall not apply to the supply of habit forming drugs on prescription or administered or dispensed by a physician, dentist, or veterinarian

§425 Preparations and remedies exempted The provisions of this article shall not apply to preparations or remedies which do not contain more than two grains of opium, or more than one-fourth of a grain of morphine, or more than one-eighth of a grain of heroin or more than one grain of codeine, or any salt or derivative of any of them in one fluid ounce, or, if a solid or semi-solid preparation, in one avoirdupois ounce, or to liniments, ointments, or other preparations which are prepared for external use only, except liniments, ointments, and other preparations which contain cocaine or any of its salts or alpha or beta eucaine or any of their salts or any synthetic substitute for them, provided that such remedies and preparations are sold, distributed, dispensed, or possessed as medicines and not for the purpose of evading the intentions and provisions of this article

§426 Professional use of habit forming drugs

1 Veterinarians A veterinarian may prescribe, administer or dispense habit forming drugs in good faith and in the course of his professional practice only, and not for use by a human being

2 Dentists A dentist, in good faith and in the course of his professional practice only, may administer or dispense habit forming drugs to patients under his immediate treatment

3 Physicians A physician, in good faith and in the course of his professional practice only, may prescribe, administer, or dispense habit forming drugs

§427 Prescription Any apothecary may sell or dispense habit forming drugs to any individual upon a written prescription of a physician, or veterinarian, dated and signed on the day when issued and bearing the full name and address of the patient and the name, address and registry number of the practitioner under the Harrison Act if he is required by it to be so registered. The person filling the prescription must write the date of filling and his own signature upon the face of the prescription, and the prescription must be retained on file by the apothecary filling it for two years so as to be readily accessible for inspection and it shall be subject to inspection by any public officer or employee engaged in the enforcement of this article. The prescription shall not be refilled

§428 Record to be kept

1 Physicians, dentists, veterinarians Every physician, dentist and veterinarian shall keep a

record of all habit forming drugs administered or dispensed by him, except such as may be administered or dispensed to a patient upon whom he shall personally attend showing the amount administered or dispensed

2 Manufacturers and wholesalers Manufacturers and wholesalers shall keep a record of the habit forming drugs received and disposed of by them

3 Exempted preparations and remedies Every manufacturer of exempted preparations or remedies shall keep a record of the amount of habit forming drugs received and of all sales of exempted preparations or remedies and every dealer therein shall keep a record of all sales of exempted preparations and remedies

4 Form and preservation Every such record shall be kept for a period of two years from the date of the transaction recorded, and a record required by or under the Harrison Act, containing substantially the same information, shall be a compliance with this section. All records required by this section shall be readily accessible for inspection and shall be open to inspection by the proper authorities

§429 Labels Whenever an apothecary pursuant to a written prescription shall sell or dispense habit forming drugs or whenever a physician, dentist or veterinarian shall dispense any of such drugs, he shall securely affix to the container of such drug a label stating in legible English the name and address of the physician or veterinarian prescribing or dispensing and of the apothecary or dentist dispensing, the date and the name and address of the person for whom or the owner of the animal for which the drug is dispensed

§430 Authorized possession of drugs by individual A person to whom or for whose use any habit forming drug has been sold or dispensed by an apothecary, physician or dentist or the owner of an animal for which any such drug has been prescribed or dispensed by a veterinarian, may lawfully possess it in the container delivered to him by the person selling or dispensing same

§431 Physical examination required A physician, dentist or veterinarian shall not administer, dispense or prescribe any habit forming drugs except after a physical examination of the person for whom or the animal for which the drug is intended

§432 Instruments for injection of habit forming drugs No person except a manufacturer or a wholesale or retail dealer in surgical instruments, apothecary, physician, dentist, veterinarian, nurse or interne shall at any time have or possess a hypodermic syringe or needle or any instrument or implement adapted for the use of habit forming drugs by subcutaneous injections and which is possessed for the purpose of administering habit forming drugs unless such posses-

sion be authorized by the certificate of a physician issued within the period of one year prior thereto

§ 433 Exemption from restrictions 1 Common carriers, employees, public officers The provisions of this article restricting the possessing or having under control of habit forming drugs shall not apply to common carriers or warehousemen or their employees engaged in lawful transportation or storage of such drugs, nor to public officers or employees while engaged in the performance of their official duties, nor to temporary incidental possession by employees or agents of persons lawfully entitled to possession, or by persons whose possession is for the purpose of aiding public officers in the performance of their official duties

2 Interstate commerce This article shall not apply to acts done, or to habit forming drugs possessed in the course of interstate or foreign commerce

§ 434 Drugs delivered to the State Hospital Commission All drugs which have been seized and judicially determined to have been unlawfully possessed or the title to which has ceased and which have come into the hands of a peace officer shall, upon the direction of a court or magistrate, be delivered to the state hospital commission unless destroyed according to law or by regulation of the commission The commission may receive drugs surrendered to it subject to the rights of any person lawfully entitled thereto, and all drugs in final possession of the commission may be disposed of or destroyed under its direction. The commission shall keep a record of the receipt and disposition thereof

§ 435 Notice of conviction of professional man sent to licensing board

1 On conviction of any physician, dentist, veterinarian or apothecary for wilful violation of any of the provisions of this article, a copy of the sentence and of the opinion of the court or magistrate if any be filed, shall be sent by the clerk of the court or by the magistrate to the board or officer having power to suspend or revoke the license or registration of the person convicted, for such action as the board or officer deems proper

2 At the request of such board or officer, the clerk or magistrate shall send to such board or officer a transcript of the record or of the proceedings in a court not of record, and such portion of the evidence as may be requested

§ 436 Records confidential. Prescriptions, orders or records required under this article shall not be open to inspection nor shall any information contained therein be divulged except for the purpose of enforcing the laws of this state or the Harrison Act, or on the direction of the depart-

ment of state police or of the Police Department of any city to an officer of another state, for the purpose of enforcing the law of such state

§ 437 Fraud or deceit Any fraud, deceit, misrepresentation, subterfuge, concealment of a material fact or the use of a false name or the giving of a false address in obtaining treatment in the course of which habit forming drugs shall be prescribed or dispensed or in obtaining any supply of such drugs shall constitute a violation of the provisions of this article and shall not be deemed a privileged communication The wilful making of any false statement in any prescription, order, report, or record required under this article shall constitute a violation of this article No person shall for the purpose of obtaining any habit forming drug falsely assume the title or represent himself to be a manufacturer, wholesaler, apothecary, physician, dentist, veterinarian, or make or utter any false or forged order or prescription for or label for a container of or for habit forming drugs, or affix such label, or alter, deface or remove any such label

§ 438 Commitment of addicts, procedure, discharge. 1 At request of addict. A magistrate upon the voluntary application to him of any habitual user of any habit forming drug, may commit such person to any correctional or charitable institution maintained by the state or any political subdivision thereof

2 Person accused of crime. Any trial court having jurisdiction of a defendant who is a prisoner in a criminal action or proceeding, if it appears that the defendant is an habitual user of any habit forming drug and is suffering as a result of such use may likewise so commit such defendant, at any stage of such action or proceeding and direct a stay of proceedings or suspend sentence or withhold conviction pending the period of such commitment but not exceeding sixty days without a further order of the court

3 Discharge. Whenever the medical officer of the institution, or if there be no medical officer, the superintendent, shall certify to the committing magistrate or court that any person so committed has been sufficiently treated, or give any other reason which is deemed by the magistrate or court to be adequate and sufficient, he may in accordance with terms of commitment discharge the person so committed, or return such person to await the further action of the court, provided however, that when such commitment is to an institution under the jurisdiction of the department of correction, or other similar department in a city of the first class where there is a parole commission established pursuant to law, such commission shall act in the place and stead of a chief medical officer for the purpose of making such a certificate.

§ 439 Exceptions and exemptions not required to be negated. In any complaint, in-

vided in this section, shall be lawful if in the regular course of business, occupation, profession, employment, or duty of the possessor and in an amount necessary therefor

4 This section shall not apply to the supply of habit forming drugs on prescription or administered or dispensed by a physician, dentist, or veterinarian

§ 425 Preparations and remedies exempted The provisions of this article shall not apply to preparations or remedies which do not contain more than two grains of opium, or more than one-fourth of a grain of morphine, or more than one-eighth of a grain of heroin or more than one grain of codeine, or any salt or derivative of any of them in one fluid ounce, or, if a solid or semi-solid preparation, in one avoirdupois ounce, or to liniments, ointments, or other preparations which are prepared for external use only, except liniments, ointments, and other preparations which contain cocaine or any of its salts or alpha or beta eucaine or any of their salts or any synthetic substitute for them, provided that such remedies and preparations are sold, distributed, dispensed, or possessed as medicines and not for the purpose of evading the intentions and provisions of this article

§ 426 Professional use of habit forming drugs

1 Veterinarians A veterinarian may prescribe, administer or dispense habit forming drugs in good faith and in the course of his professional practice only, and not for use by a human being

2 Dentists A dentist, in good faith and in the course of his professional practice only, may administer or dispense habit forming drugs to patients under his immediate treatment

3 Physicians A physician, in good faith and in the course of his professional practice only, may prescribe, administer, or dispense habit forming drugs

§ 427 Prescription Any apothecary may sell or dispense habit forming drugs to any individual upon a written prescription of a physician, or veterinarian, dated and signed on the day when issued and bearing the full name and address of the patient and the name, address and registry number of the practitioner under the Harrison Act if he is required by it to be so registered. The person filling the prescription must write the date of filling and his own signature upon the face of the prescription, and the prescription must be retained on file by the apothecary filling it for two years so as to be readily accessible for inspection and it shall be subject to inspection by any public officer or employee engaged in the enforcement of this article. The prescription shall not be refilled

§ 428 Record to be kept

1 Physicians, dentists, veterinarians Every physician, dentist and veterinarian shall keep a

record of all habit forming drugs administered or dispensed by him, except such as may be administered or dispensed to a patient upon whom he shall personally attend showing the amount administered or dispensed

2 Manufacturers and wholesalers Manufacturers and wholesalers shall keep a record of the habit forming drugs received and disposed of by them

3 Exempted preparations and remedies Every manufacturer of exempted preparations or remedies shall keep a record of the amount of habit forming drugs received and of all sales of exempted preparations or remedies and every dealer therein shall keep a record of all sales of exempted preparations and remedies

4 Form and preservation Every such record shall be kept for a period of two years from the date of the transaction recorded, and a record required by or under the Harrison Act, containing substantially the same information, shall be a compliance with this section. All records required by this section shall be readily accessible for inspection and shall be open to inspection by the proper authorities

§ 429 Labels Whenever an apothecary pursuant to a written prescription shall sell or dispense habit forming drugs or whenever a physician, dentist or veterinarian shall dispense any of such drugs, he shall securely affix to the container of such drug a label stating in legible English the name and address of the physician or veterinarian prescribing or dispensing and of the apothecary or dentist dispensing, the date and the name and address of the person for whom or the owner of the animal for which the drug is dispensed

§ 430 Authorized possession of drugs by individual A person to whom or for whose use any habit forming drug has been sold or dispensed by an apothecary, physician or dentist or the owner of an animal for which any such drug has been prescribed or dispensed by a veterinarian, may lawfully possess it in the container delivered to him by the person selling or dispensing same

§ 431 Physical examination required A physician, dentist or veterinarian shall not administer, dispense or prescribe any habit forming drugs except after a physical examination of the person for whom or the animal for which the drug is intended

§ 432 Instruments for injection of habit forming drugs No person except a manufacturer or a wholesale or retail dealer in surgical instruments, apothecary, physician, dentist, veterinarian, nurse or interne shall at any time have or possess a hypodermic syringe or needle or any instrument or implement adapted for the use of habit forming drugs by subcutaneous injections and which is possessed for the purpose of administering habit forming drugs unless such posses-

This bill has been passed and signed by the Governor, and is now Chapter 25, Laws of 1924

**In Re Distribution of Information Concerning Results of Scientific Study**—Senate Int No 436 (Print No S 445), by Senator Michael E Reiburn of New York, concurrent Assembly Int No 588 (Print No A 592), by Assemblyman Joseph Gavagan of New York, referred to Judiciary Committee in each house Still in committee.

**In Re Workmen's Compensation Law**—Senate Int No 682 (Print No S 477), by Senator Peter J McGarry of Queens County, concurrent Assembly Int No 682 (Print No A 693), by Assemblyman A I Miller of Westchester County, would amend section 118, Workmen's Compensation Law, by authorizing physical examinations and practical tests of claimant to determine loss of use and proportionate loss of use of a member, result and test thereof to be made part of record Referred to Labor and Industries Committee in each house

**Comment** A new interpretation placed upon the new matter introduced, "and may make such physical examinations and practical tests of claimants to determine loss of use and proportionate loss of use of a member and the result of such examinations and tests shall be made part of the record, and shall be competent evidence upon which to base an award," would seem to place the power of such examinations in the hands of the commissioner in such a manner that laymen might be called upon to make such examinations to the exclusion or negation of physicians and their testimony, and such being an interpretation as placed upon the bill it can be readily appreciated that the members of the Medical Society cannot be in the affirmative for the bill, unless another paragraph be inserted to clear up this interpretation which would admit of such testimony only as a practical feature of weight of the present moment

**The Child Experimentation Bill**—Senate Int No 584 (Print No S 608), by Senator John P Ryan of Rensselaer County, referred to Senate Codes Committee, no concurrent bill has as yet appeared in the Assembly

Still in committee

**The Anti-Vivisection Bill**—Senate Int No 588 (Print No S 612), by Senator John P Ryan of Rensselaer County, concurrent Assembly Int No 1094 (Print No A 1180), by Assemblyman Samuel Mandelbaum of New

York Referred to Codes Committee in each house

Still in committee

A hearing has been called for March 25, at 1 p m, on the concurrent Assembly bill, and it is hoped that there will be present on that date representatives of the medical profession who have been invited to speak in opposition to the bill

No replies have been received from the County Legislative Chairmen as to their interviews with their legislators relative to this bill

**The State Department of Education Bill to Amend the Medical Practice Act**—Senate Int No 637 (Print No S 663), by Senator Daniel J Carroll of Kings County concurrent Assembly Int No 888 (Print No A 927), by Assemblyman Frank H Lattin of Orleans County, still in Public Health Committee of Senate and in Assembly Ways and Means

A joint hearing has been called on this bill for Wednesday, March 26, at 2 p m, before the Senate Committee on Public Health and the Assembly Committee on Ways and Means

As a conference of the County Legislative Chairman with the officers and Council of the State Society, and the Committee on Legislation and the Advisory Committee on Legislation, will be held on Wednesday, March 19, at 12 o'clock It is hoped that the differences of opinion regarding the bill which have come up may be satisfactorily adjusted and that the conference may adjourn in due time to be present in a body at the hearing in the Capitol

To date the County Medical Societies are on record as follows

Counties in favor of proposed bill (32)—Albany, Cayuga, Chautauqua, Chemung, Columbia, Dutchess Putnam, Essex (no vote), Franklin, Greene, Jefferson, Monroe, Montgomery, Oneida, Onondaga, Ontario, Orleans, Otsego (with the exception of the registration feature), Richmond, Rockland, St. Lawrence (no vote) Saratoga, Schoharie, Schuyler, Seneca, Suffolk, Sullivan, Tompkins, Washington, Wayne, Westchester, Yates, Bronx.

Counties opposed to bill (14)—Allegany, Broome, Eric, Fulton (any bill requiring registration), Genesee, Kings, Livingston, Madison (no vote) Nassau, Orange, Queens, Rensselaer (any bill requiring registration), Schenectady, Ulster

Counties not heard from (13)—Cattaraugus, Chenango, Cortland Delaware, Herkimer, Lewis, New York Oswego, Steuben, Tioga, Wyoming, Clinton, Niagara

**In Re Practice of Chiropraxy and Podiatry**—Senate Int No 738 (Print No S 781), by

Senator William Byrne of Albany County, concurrent Assembly Int 507 (Print No 507, 950, 1606), by Assemblyman Paul T Kammerer of New York, will be dropped

In Re Incorporation, Maintenance, etc., of Hospitals, Infirmarys, Dispensaries, etc.—Senate Int No 892 (Print No S 962), by Senator Ellwood M Rabenold of New York, concurrent Assembly Int No 1452 (Print No A 1622), by Assemblyman E B Jenks of Broome County, would amend sections 4, 40, 41, Membership Corporations Law, relative to incorporation and to extension of corporate purposes for the establishment and maintenance of hospitals, infirmarys, dispensaries and homes for invalids or the aged or indigent Referred to Judiciary Committee in each house

STATE OF NEW YORK

No 962

Int 892

IN SENATE,

February 26, 1924

Introduced by Mr Rabenold—read twice and ordered printed, and when printed to be committed to the Committee on the Judiciary

#### AN ACT\*

To amend the membership corporations law, in relation to incorporation, or extension of corporate purposes, for establishment and maintenance of hospitals, infirmarys, dispensaries and homes for invalids, or the aged or indigent

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Sections four and forty of chapter forty of the laws of nineteen hundred and nine, entitled "An act relating to membership corporations, constituting chapter thirty-five of the consolidated laws," are hereby amended to read as follows

§ 4 Extension of corporate purposes by supplemental certificate A membership corporation, created under or by a general or special law for purposes for which a corporation may be created under any article of this chapter may, from time to time, extend its corporate purposes so as to include any other purpose for which a corporation may be created under such article by filing in the offices in which its original certificates of incorporation, if any, are filed, or otherwise in the offices in which original certificates of incorporation for such purposes are required to be filed, a copy of a resolution in favor of such extension, certified by the president and secretary of the corporation to have been duly adopted by the concurring vote of a majority of the members of the corporation present at an annual meeting, or a special meeting duly called for that purpose, and a certificate signed and acknowledged by a majority of the directors of the corporation,

in pursuance of such resolution, with the approval, indorsed thereupon or annexed thereto, of a justice of the supreme court, and if the care of orphan, pauper or destitute children, *or the establishment and maintenance of a hospital, infirmary, dispensary, home for invalids, aged or indigent persons*, be included among such corporate purposes, with the additional approval indorsed thereupon or annexed thereto, of the state board of charities

§ 40 Purposes for which corporations may be formed under this article A membership corporation may be created under this article for the purpose of erecting, establishing and maintaining a hospital, infirmary, dispensary, home for invalids, aged or indigent persons, or for any other lawful purpose, except a purpose, for which a corporation may be created under any other article of this chapter, or any other general law than this chapter

§ 2 Section forty-one of such chapter, as last amended by chapter one hundred and eighty-eight of the laws of nineteen hundred and twenty-three, is hereby amended to read as follows

§ 41 Certificates of incorporation Five or more persons may become a membership corporation for any one of the purposes for which a corporation may be formed under this article or for any two or more of such purposes of a kindred nature, by making, acknowledging and filing a certificate, stating the particular objects for which the corporation is to be formed, each of which must be such as is authorized by this article, the name of the proposed corporation, the territory in which its operations are to be principally conducted, the town, village or city in which its principal office is to be located, [if it be then practicable to fix such location], the number of its directors, not less than three nor more than [one hundred] *forty-eight*, and the names and places of residence of the persons to be its directors until its first annual meeting *The certificate of incorporation of a hospital or dispensary may also specify the qualifications of members of the corporation with respect to their adherence or non-adherence to a particular school or theory of medical or surgical treatment, and the systems of medical practice or treatment to be used in such hospital or dispensary* Such certificate shall not be filed without the written approval, indorsed thereupon or annexed thereto, of a justice of the supreme court If such certificate specify among such purposes the care of orphan, pauper or destitute children, the establishment or maintenance of a [maternity] hospital, *infirmary, dispensary, home for invalids, aged or indigent persons*, or lying-in asylum where women may be received, cared for or treated during pregnancy or during or after delivery, or for boarding or keeping nursing children, the written approval of the state board of charities shall also be indorsed thereupon or annexed thereto,

\* EXPLANATION—Matter in italics is new, matter in brackets [ ] is old law to be omitted

before the filing thereof. On filing such certificate, in pursuance of law, the signers thereof, their associates and successors, shall be a corporation in accordance with the provisions of such certificate. Any corporation heretofore or hereafter organized under this article for the purpose of gathering, obtaining and procuring information and intelligence, telegraphic or otherwise, for the use and benefit of its members, and to furnish and supply the same to its members for publication in newspapers owned or represented by them, may admit as members thereof, other corporations, limited liability companies, joint stock or other associations, partnerships and individuals engaged in the same business or in the publication of newspapers, periodicals or other publications, upon such terms and conditions, not inconsistent with law or with its certificate of incorporation, as may be prescribed in its by-laws.

§ 3 Article seven of such chapter is hereby repealed.

§ 4 This act shall take effect immediately.

*Comment* This bill seems to be, from its context, a most unsatisfactory one, since it might work to the incorporation of an institution for most extensive cult practice and might offer entrance of a patient into a special type of hospital under accident or through accident, and by rules of such hospital, which could be drawn up and need not be passed upon by the State Hospital Commission Commissioner of Health or other present authorities, said patient might be during extreme illness compelled to remain in that hospital, forbidden visitation by friends or transference to another hospital.

The present theory as regards the incorporation of institutions as mentioned in the bill would be disrupted and the inspections and provisions as now exist relative to guarantee offered by the State for the protection of the public health could be set at naught, requiring judicial action to determine proper recourses on the part of the public, those who practice the healing art or the present State Departments who have to do with the enforcement of the present laws.

The bill is a dangerous one and County Chairmen are asked to forward arguments to their individual Representatives in opposition to its passage.

Requiring Iron Stairways on Outside of Sanitariums, etc.—Senate Int. No. 894 (Print No. S 964), by Senator Mortimer Y. Ferris of Ticonderoga, concurrent Assembly Int. No. 1212 (Print No. A. 1335), by Assemblyman Ralph H. Loomis of Delaware County, referred to Public Health Committee in each house. Still in committee. The bill will be dropped.

Relative to the Practice of Pharmacy—Senate Int. No. 895 (Print No. S 968), by Senator Daniel J. Carroll of Kings County, concurrent Assembly Int. No. 1021 (Print No. A. 1035), by Assemblyman Frank H. Lattin of Orleans County. Still in Public Health Committee in each house. Will be dropped.

In Re Defining a Drug Addict as a Disorderly Person, Except When Drug Is Prescribed by a Physician—Senate Int. No. 908 (Print No. S 981), by Senator James L. Whitley of Rochester, concurrent Assembly Int. No. 1158 (Print No. A. 1268), by Assemblyman Burton D. Esmond of Saratoga County. Referred to the Codes Committee in each house. Still in committee.

A hearing has been called on the concurrent Assembly bill before the Assembly Codes Committee for March 18, at 1 p. m.

*Comment* Your Legislative Bureau has heard from several of your Legislative and Advisory Committees in opposition to the above measure as follows:

From one member—"As to Senate Print 981, branding drug addicts as disorderly persons, I cannot be enthusiastic. It would open the way to an awful lot of blackmail."

From another member—"I really don't feel like approving Senate bill Print No. 981. No doubt many addicts are criminals, but some are not. Most of them have some nerve defect, and the only hope of curing them, as a rule, is skilled medical attention in a suitable hospital to which they should be committed."

And from another member—"This makes criminals of all addicts. I am opposed to such idea."

The bureau would call attention to the fact that the bill seemingly is intended to reach those persons who are not under the care of physicians, as it specifically states in the new subdivision 10 to be added—"10. Persons who are addicted to the habitual use of cocaine or opium or the derivatives of cocaine or opium, or of any other habit forming drug, *except as administered, prescribed or dispensed by a duly licensed physician*." And this would seem to care for the ambulatory addicts who are under treatment by a physician, as well as for such addicts who commit themselves voluntarily, being under the care then of physicians within hospitals which have to do with the treatment of such cases.

However, comment is invited immediately, inasmuch as this is along the general line of settling in a sane manner the narcotic question in this State.

**Requiring Railroad Companies to Keep Heat in Passenger Cars**—Senate Int No 923 (Print No S 996), by Senator Frank Giorgio of Queens County, would add new section 318, Public Health Law, requiring railroad companies to keep heat in each passenger car between October 15 and April 15 at not less than 50 degrees above zero. Referred to Public Health Committee. Still in committee. No comment having been received, the bill will be dropped.

**Requiring Compulsory Study of Artificial Respiration in Public Schools**—Senate Int No 945 (Print No S 1033), by Senator William L. Love of Brooklyn, N. Y., which has been referred to the Senate Public Education Committee, would add new section 620-a, Education Law, requiring in public schools compulsory study of artificial respiration by prone pressure for restoring persons rescued from drowning, asphyxiated by gas or who have received electric shock.

*Comment* In theory without doubt, the study and practice of artificial respiration should be taught at least for a short period in the public schools.

However, it would seem that this bill could be well commented on by the State Medical Inspector of Schools, who is connected with the State Department of Education.

## NEW BILLS SINCE LAST WEEK

**Providing for Medical and Surgical Care of Children Under 16 Years of Age at Expense of County**—Senate Int No 967 (Print No S 1063), by Senator Frederick M. Davenport of Clinton, N. Y., concurrent Assembly Int No 1389 (Print No A 1538), by Assemblyman T. C. Moore of Westchester County, would add new section 56-a, Poor Law, by providing for medical or surgical care of children under 16 years of age at expense of county.

STATE OF NEW YORK

No 967

Int 1063

IN SENATE,

March 3, 1924

Introduced by Mr. Davenport—read twice and ordered printed, and when printed to be committed to the Committee on Public Health.

### AN ACT\*

To amend the poor law, in relation to the medical or surgical care of children under sixteen years of age.

*The People of the State of New York, represented in Senate and Assembly, do enact as follows:*

Section 1 Chapter forty-six of the laws of nineteen hundred and nine, entitled "An act in

relation to the poor, constituting chapter forty-two of the consolidated laws," is hereby amended by inserting therein a new section, to be section fifty-six-a, to read as follows:

§ 56-a Medical or surgical care of children under sixteen years of age. Whenever it shall appear to a superintendent of the poor, overseer of the poor, board of charities, commissioner of charities or other public officer or board, charged with the relief of the poor, that a child under sixteen years of age is in need of medical or surgical care, an order may be made for the treatment of such child in its home, a hospital or other institution, and the expense thereof, when approved by the officer or board issuing such order, shall be a charge upon the county or the proper subdivision thereof, but persons legally responsible for the support of such child shall be liable to pay a part or all of the expenses of such treatment.

§ 2 This act shall take effect immediately.

*Comment* This bill, on its face, apparently is a satisfactory bill and will relieve the medical profession from much care now imposed upon it from a charitable standpoint as well as providing more adequate care of a higher standard for the good of the public health in children under 16 years.

**In Regard to Crippled Children**—Senate Int No 1010 (Print No S 1105), by Senator William Byrne of Albany County, concurrent Assembly Int No 1443 (Print No 1592), by Assemblyman J. Boyle of Albany County, would create temporary State commission to inquire into and report on number, distribution and condition of crippled children in the State, to recommend means to meet their needs and appropriating \$25,000. Referred to Senate Finance Committee and to Assembly Ways and Means Committee.

STATE OF NEW YORK

No 1105

Int 1010

IN SENATE,

March 3, 1924

Introduced by Mr. Byrne, read twice and ordered printed, and when printed to be committed to the Committee on Finance.

### AN ACT

To create a temporary commission to inquire into and report upon the number, distribution and condition of crippled children throughout the state, to recommend means more adequately to meet their needs, and making an appropriation therefor.

*The People of the State of New York, represented in Senate and Assembly, do enact as follows:*

Section 1 A temporary state commission is hereby created to inquire into and report upon the number, distribution and condition of crippled children throughout the state, and the existing facilities and legal provisions for promoting

\* EXPLANATION—Matter in italics is new, matter in brackets [ ] is old law to be omitted.

the care, treatment, education and general welfare of such children, and to recommend means more adequately to meet their needs. In making such inquiry, the commission shall confer with the representatives of civic bodies and other organizations and groups, which have made special study of the subject, for the purpose of availing itself of their experience.

§ 2 Such commission shall consist of eight members, as follows: The state commissioner of education, or an officer of his department to be designated by him, the president of the state board of charities, or an officer of his department to be designated by him, the state commissioner of health, or an officer of his department to be designated by him, a representative of the state society for crippled children to be designated by the governor upon recommendation of such society, two members of the senate to be appointed by the temporary president of the senate, and two members of the assembly to be appointed by the speaker of the assembly. Vacancies in the commission shall be filled by the officer authorized to make the original designation or appointment.

§ 3 The commission shall choose from its members a chairman and vice-chairman and may employ such subordinates as may be needed. It may sit within or without the state, may take testimony, compel the attendance of witnesses and the production of books and papers and otherwise have all the powers of a legislative committee, as provided by the legislative law including the adoption of rules for the conduct of its proceedings.

§ 4 The members of such commission shall receive no compensation for their services but shall be entitled to their actual and necessary expenses incurred in the performance of their duties.

§ 5 The commission shall make a report of its proceedings together with its recommendations, to the legislature on or before the fifteenth day of February, nineteen hundred and twenty-five and may accompany its report with such proposed legislative measures to carry its recommendations into effect as to the commission may seem proper.

§ 6 The sum of twenty-five thousand dollars (\$25,000) or so much thereof as may be needed is hereby appropriated for the actual and necessary expenses of the commission in carrying out the provisions of this act payable by the treasurer on the warrant of the comptroller, on the order of the chairman of such commission.

§ 7 This act shall take effect immediately.

*Comment:* None at present.

**Requiring the Licensing of Private Institutions for Treatment of Drug Addicts**—Senate Int. No. 1024 (Print No. 1120) by Senator Morton J. Kennedy of New York, concurrent

Assembly Int. No. 1117 (Print No. 1203), by Assemblyman Morris Weinfeld of New York, has been printed in full in the March 7th issue of the Journal. Referred to the Public Health Committee in each house.

No comment has been received thereon.

*Comment:* Your Committee on Legislation is in favor of this bill licensing private institutions, but would prefer to see the same carried out under the present laws relative to any hospital or institution. However, if it seems wisest to license these under the State Commissioner of Health, your Committee can see no objection to the same, as then private institutions for treatment of drug addicts will be under State license.

**Amending Insanity Law**—Senate Int. No. 1135 (Print No. S. 1255), by Senator Bernard Downog of New York, concurrent Assembly Int. No. 1495 (Print No. A. 1684), by Assemblyman Joseph McGinnies of Chautauqua County, would amend Insanity Law generally, by providing among other things State Hospital Commission may employ deputy medical inspectors to make rules governing management of and investigate any institution for care of insane, public or private and may make reciprocal agreements with other States for prompt and humane return of insane residents. Referred to Judiciary Committee in each house.

No comment thereon.

## IN ASSEMBLY

**Medical Inspection in Schools Bill**—Assembly Int. No. 66 (Print No. A. 66), by Assemblyman Joseph Reich of Kings County, is still in Assembly Public Education Committee, no concurrent bill has as yet appeared in the Senate.

**In Re State Institute for Study of Malignant Disease at Buffalo**—Assembly Int. No. 195 (Print No. A. 195), by Assemblyman Julius Berg of Bronx County, concurrent Senate Int. No. 175 (Print No. S. 175), by Senator Michael E. Reburn of New York County.

The Assembly bill is still in Ways and Means Committee.

The concurrent Senate bill has been reported out of committee.

**Extending Provision for State Aid to Counties of 50,000 and More**—Assembly Int. No. 232 (Print No. A. 232), by Assemblyman Frank H. Lattin of Orleans County, concurrent Senate Int. No. 128 (Print No. S. 128), by Senator William L. Love of Kings County, which would amend sections 19, 19 a, 19 b, Public

Health Law, by extending provision for State aid in public health work to counties of population of 50,000 or more and empowering State Health Commissioner to prescribe limitations upon such aid. No single grant shall cover more than one year. Referred to Public Health Committee.

Feb 13 Rept., Feb 14 3rd rdg., Feb. 19 passed, Feb 20 Senate, Public Health Committee. March 4 Reference changed to Senate Finance Committee.

Assembly Int No 267 (Print No 267), by Assemblyman Simon B. Van Wagenen of Ulster County, concurrent Senate Int No 127 (Print No S 127), by Senator William L. Love of Kings County, amends section 12, County Law, by permitting supervisors, except in a county constituting a general health district, to employ such public health nurses as they may deem proper. To Public Health Committee.

Feb 13 Rept., Feb 14 3rd rdg., Feb 20 passed, Feb 25 Senate Internal Affairs Committee, Feb 27 Rept.

In Re Nursing and First Aid Service in Factories, etc.—Assembly Int No 309 (Print No A 309, Print No 1306), by Assemblyman Joseph Reich of Kings County. Still in committee. No concurrent bill has as yet appeared in the Senate.

The Narcotic Bill—Assembly Int No 342 (Print No A 342), by Assemblyman Morris Weinfeld of New York, concurrent Senate Int No 285 (Print No S 289), by Senator Morton J. Kennedy of New York. Still in Public Health Committee.

See concurrent Senate Int No 285 for new draft of bill and comment.

In Re Appointing an Eye and Ear Specialist to Assist the Medical Inspector of Schools—Assembly Int No 370 (Print No A 372), by Assemblyman Frederic S. Cole of Herkimer County, concurrent Senate Int No 317 (Print No S 321), by Senator Benjamin Antin of New York. Still in Public Education Committee.

See concurrent Senate Int No 317 for comment.

In Re Practice of Chiropody and Podiatry—Assembly Int No 507 (Print No 509, 950, 606), by Assemblyman Paul T. Kammerer of New York, concurrent Senate Int No 738 (Print No S 781), by Senator William Byrne of Albany County. Still in Public Health Committee in each house. Will be dropped.

**Relative to County Mosquito Extermination Commission.**—Assembly Int. No 1313 (Print No A. 1455), by Assemblyman Julius Ruger of Kings County, which would repeal article 21, Public Health Law, which relates to county mosquito extermination commission, has been referred to Assembly Public Health Committee.

STATE OF NEW YORK

No 1455

Int 1313

IN ASSEMBLY

March 3 1924

Introduced by Mr. Ruger—read once and referred to the Committee on Public Health

AN ACT

To repeal article twenty-one of the public health law, in relation to county mosquito extermination commission.

*The People of the State of New York represented in Senate and Assembly do enact as follows:*

Section 1. Article twenty-one, consisting of

sections four hundred to four hundred and eighteen, inclusive, of chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health constituting chapter forty-five of the consolidated laws, inserted into such public health law by chapter four hundred and eight of the laws of nineteen hundred and sixteen, and last amended by chapter one hundred and ninety-six of the laws of nineteen hundred and twenty-two," is hereby repealed.

§ 2. This act shall take effect immediately.

A letter has been received from Dr. Arthur D. Jaques, a member of the Advisory Committee on Legislation, which reads as follows: Dear Dr. Vander Veer:

Assembly Bill No 1455, Int. No 1313, has been introduced and is in committee. This will abolish the Nassau County Mosquito Commission and conditions will revert to those of olden times and probably worse, both as to the nuisance of being bitten and also as to malaria. This latter we have entirely gotten rid of in Nassau County.

Will you please use your good offices to keep this bill in committee or failing in this, to oppose it vigorously?

I will be pleased to appear at a hearing in Albany if one is given.

Yours sincerely,

(Signed) ARTHUR D. JACQUES

**Providing for Medical and Surgical Care of Children Under 16 Years of Age at Expense of County.**—Assembly Int. No 1389 (Print No A. 1538), by Assemblyman T. C. Moore of Westchester County, concurrent Senate Int. No 967 (Print No S 1063), by Senator Frederick M. Davenport of Clinton, N. Y. Referred to Assembly Social Welfare Committee, and to Senate Public Health Committee.

STATE OF NEW YORK

No 1538

Int. 1389

IN ASSEMBLY

March 3 1924

Introduced by Mr. T. C. Moore—read once and referred to the Committee on Social Welfare

AN ACT

To amend the poor law in relation to the medical or surgical care of children under sixteen years of age.

*The People of the State of New York represented in Senate and Assembly do enact as follows:*

Section 1. Chapter forty-six of the laws of nineteen hundred and nine, entitled "An act in relation to the poor constituting chapter forty-two of the consolidated laws," is hereby amended by inserting therein a new section, to be section fifty-six a, to read as follows:

§ 56-a. Medical or surgical care of children under sixteen years of age. Whenever it shall

appear to a superintendent of the poor, overseer of the poor, board of charities, commissioner of charities or other public officer or board, charged with the relief of the poor, that a child under sixteen years of age is in need of medical or surgical care, an order may be made for the treatment of such child in its home, a hospital or other institution, and the expense thereof, when approved by the officer or board issuing such order, shall be a charge upon the county or the proper subdivision thereof, but persons legally responsible for the support of such child shall be liable to pay a part of all of the expenses of such treatment

§ 2 This act shall take effect immediately  
See concurrent Senate Int No 967 for comment

For Appointment of Industrial Council to Advise Industrial Commissioner — Assembly Int No 1423 (Print No A 1572), by Assemblyman C P Miller of Genesee County, concurrent Senate Int No 882 (Print No S 952), by Senator Michael E Reburn of New York, would add new section 10-a, Labor Law, for appointment by Governor of an industrial council of 10 members to advise industrial commissioner, five members to represent employees and five employers, the commissioner to act as chairman. Referred to Labor and Industries Committee in each house

*Comment* If such an advisory council is to be appointed it would seem wise that one or two physicians were added thereto

The Chiropractic Bill—Assembly Int No 1434 (Print No A 1583), by Assemblyman W J Snyder of Albany County, which would add new article 8-b, Public Health Law, creating a board of chiropractic examiners and regulating practice of chiropractic, which is defined to be science of palpating and adjusting the articulation of the human spinal column by hand only

Referred to Assembly Public Health Committee

STATE OF NEW YORK

No 1583

Int 1434

IN ASSEMBLY,

March 4, 1924

Introduced by Mr Snyder—read once and referred to the Committee on Public Health

#### AN ACT

To amend the public health law, creating a board of chiropractic examiners and regulating the practice of chiropractic and prohibiting the practice of any other mode or system under the name of chiropractic.

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Chapter forty-nine of the laws of

nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," is hereby amended by inserting therein a new article, to follow article eight-a, to be article eight-b, to read as follows

#### ARTICLE 8-B

§ 189 Creation of a board There is hereby created a board of chiropractic examiners, to be known as the state board of chiropractic examiners

The board of chiropractic examiners shall consist of three members who shall be appointed by the governor within thirty days after this article takes effect

The appointees shall meet within ten days after their appointment and organize by electing a president, secretary and treasurer, and adopting reasonable rules and regulations for the transaction of business

The appointees shall have the qualifications set forth in section one hundred and eighty-nine-h of this article. Subsequent appointees shall be graduates of chiropractic schools or colleges giving a course of at least three years of six months each, in anatomy, physiology, symptomatology, hygiene, sanitation, chiropractic analysis and the principles and practice of chiropractic and requiring actual attendance upon the classes. No one may be appointed who practices anything but chiropractic as hereinafter defined

The term of office of the first member shall be one year, the second, two years, the third, three years. Appointees after the first shall serve for three years, and until their successors shall have been duly appointed and qualified. Vacancies shall be filled by the governor within thirty days

§ 189-a Meetings The board shall hold regular meetings to examine applicants and the transaction of business, commencing on the first Monday of March, August and November, in each year. Special meetings may be called by the president and secretary upon thirty days' notice printed in a newspaper of general circulation in the state

§ 189-b Offices The superintendent of public buildings shall, at the request of the board, provide an office where meetings may be held. Special meetings may be called anywhere in the state

§ 189-c Eligibility Any person of good moral character, who is a graduate of a chiropractic school or college teaching chiropractic, and giving a course of at least three years of six months each in the subjects enumerated in section one hundred and eighty-nine hereof, and requiring actual attendance upon the classes, shall be eligible to examination, provided he possesses preliminary education or experience equivalent to a high school education, and provided further, that he practices nothing but chiropractic, as hereinafter defined

§ 189 d Chiropractic defined Chiropractic is defined to be the science of palpating and adjusting the articulations of the human spinal column by hand only This definition is inclusive and any and all other methods are hereby declared not to be chiropractic

§ 189-e Practitioners No person shall practice chiropractic without a license, which license shall not entitle him to practice anything else. And no one may hold himself out as a chiropractor without having a license

§ 189-f Examinations Anyone desiring an examination, shall, at least fifteen days prior to the meeting of the board, make written application to the secretary Such application shall be accompanied by an examination fee of fifteen dollars The application shall state the name, age, sex, and place of residence of the applicant, the name and location of the school or college from which he graduated the length of time devoted to the study of chiropractic, the date of graduation, together with such other data as the applicant may desire to give In case an applicant fails in the first examination, he shall be entitled to a second one, without further fee. Application shall be signed and sworn to by the applicant

The board shall prepare reasonable questions, and fairly mark and grade the answers thereto, all of which shall be done solely for the purpose of determining whether the applicant is reasonably qualified to practice chiropractic All applicants reasonably qualified to practice chiropractic shall be granted a license

§ 189 g Licenses All licenses shall be signed by the president and secretary of the board, and shall be attested by the official seal of the board The licensee shall pay to the secretary of the board before the license is issued a fee of five dollars Every license to practice chiropractic shall, before the licensee begins practice thereunder, be registered in a book kept in the clerk's office of the county where such practice is to be carried on, with name, residence place and date of birth, and source, number and date of license to practice.

Every licensee shall be required to pay to the secretary of board an annual renewal license fee of two dollars

§ 189 h Licenses without examination Any person of good moral character who has been continuously engaged in the practice of chiropractic in the state for two years prior to the passage of this article shall be licensed without examination, upon payment to the secretary of the board a fee of twenty dollars if he applies for a license within twenty days after the organization of the board

§ 189 i Reciprocity Any person of good moral character, licensed by a chiropractic board of any other state or territory or holding a certificate from the national board of chiropractic

examiners, shall be licensed without examination, upon payment to the secretary of the board of a fee of twenty dollars

§ 189-j Revocation Upon complaint to the board after twenty days' notice of time and place of trial has been given to any licensee, if it shall be found that he practices anything other than chiropractic to cure or relieve disease or to remove the cause thereof without having a separate license therefor, or, if it be found that he no longer possesses a good moral character or is addicted to the use of narcotic drugs or in any way is guilty of deception or fraud in the practice of chiropractic his license shall be revoked

The action of the board shall be reviewable by certiorari proceedings

§ 189 k Finances Within ten days after the close of every meeting of the board, the treasurer of the board shall turn over to the state treasurer all fees and money received by the board and take his receipt therefor

The state treasurer shall keep the same in a separate fund to be used in paying running expenses of the board and a per diem compensation of fifteen dollars to the members thereof for such time as they may actually spend in the discharge of their official duties and traveling expenses

Payments from such fund shall be made by the state treasurer on the warrant of the comptroller and the vouchers of the president of the board

If, at the close of any fiscal year, there remains in the hands of the state treasurer from moneys received from the board one thousand dollars in excess of all indebtedness of the board, the same shall be turned over to the public school fund

§ 189 l Penalties Any person violating any of the provisions of this article shall be deemed guilty of a misdemeanor and upon conviction thereof shall be punished by a fine not to exceed three hundred dollars or by imprisonment for a term not to exceed three months, or by both such fine and imprisonment

§ 2 Repeal All acts or parts of acts in conflict with this article are hereby repealed

§ 3 When act to take effect This act shall take effect immediately

Your Legislative Bureau invites comment thereon

In Regard to Crippled Children.—Assembly Int No 1443 (Print No A 1592), by Assemblyman J Boyle of Albany County, concurrent Senate Int No 1010 (Print No S 1105), by Senator Wm Byrne of Albany County Referred to Assembly Ways and Means Committee and to Senate Finance Committee

See concurrent Senate Int No 1010

appear to a superintendent of the poor, overseer of the poor, board of charities, commissioner of charities or other public officer or board, charged with the relief of the poor, that a child under sixteen years of age is in need of medical or surgical care, an order may be made for the treatment of such child in its home, a hospital or other institution, and the expense thereof, when approved by the officer or board issuing such order, shall be a charge upon the county or the proper subdivision thereof, but persons legally responsible for the support of such child shall be liable to pay a part of all of the expenses of such treatment

§ 189-c Eligibility Any person of good moral character, who is a graduate of a chiropractic school or college teaching chiropractic, and giving a course of at least three years of six months each in the subjects enumerated in section one hundred and eighty-nine hereof, and requiring actual attendance upon the classes, shall be eligible to examination, provided he possesses preliminary education or experience equivalent to a high school education, and provided further, that he practices nothing but chiropractic, as hereinafter defined

may be assigned to perform such duties under the direct control of the district director of school hygiene of such school hygiene district. Such district director of school hygiene shall be subject to supervision by the state medical inspector of schools.

(4) The board of supervisors after determining the amount of the appropriation necessary for the salary and expenses of such district director of school hygiene, shall levy one half of such amount by tax on the towns, union free school districts and cities, if any, included within such school hygiene district and shall apportion such amount so levied, among such towns, union free school districts, and cities according to the assessed valuation of the taxable property therein. Whenever a board of supervisors shall make such an appropriation and levy such a tax the commissioner of education shall apportion to each such town, union free school district, and city, an amount equal to that so levied upon each such respective town, union free school district and city. The sums collected from the taxes so levied and the amount apportioned by the commissioner of education shall be paid to the county treasurer of such county who shall expend such moneys for the purposes hereinabove provided and in the same manner as other county charges are paid.

§ 2. This act shall take effect immediately.

# State Department of Health

## DIPHTHERIA IMMUNIZATION GOES ON

In spite of the accidents which recently occurred in Concord, Mass., immunization with toxin-antitoxin is proceeding in Auburn and in Syracuse. The value of such immunization has been so clearly demonstrated in and about Auburn that the work is demanded.

## POUGHKEEPSIE WANTS COMMUNICABLE DISEASE HOSPITAL

The lack of hospital facilities for cases of contagious diseases in Poughkeepsie has aroused considerable local demand for such an institution.

## STERILE CORD DRESSINGS TO BE SUPPLIED TO MIDWIVES

The Division of Maternity, Infancy and Child Hygiene has made arrangements to supply midwives with sterile umbilical dressings. These are put up in cartons containing seven dressings and the use of them is now being demonstrated in many communities.

## CHILD HEALTH STATIONS IN LIVINGSTON COUNTY.

Five new child health stations are to be located in Livingston County in the following communities: Avon, Dansville, Geneseo, Retsof and Mount Morris. The county board of supervisors has applied for an allotment from Sheppard-Towner funds to help defray the expenses of these stations.

## JEFFERSON COUNTY ACCEPTS SHEPPARD-TOWNER AID

The Board of Supervisors of Jefferson County has requested aid in a program of child welfare for that county. Eight thousand dollars has been appropriated locally for nursing service.

## ANOTHER TYPHOID CARRIER FOUND

A typhoid carrier with a history of the disease 46 years ago has been discovered on a dairy farm. The actual carrier history of this individual covers a period of fifteen years, the most recent cases being three fatalities in one family. Incidentally, the one member of this family who received typhoid vaccine sufficiently early did not acquire the disease.

## COUNTY LABORATORIES RECEIVE STATE AID

The following counties have been granted State aid for local laboratories under Chapter 638, Laws of 1923:

Wyoming County, budget	\$6,900
Madison County, budget	4,650
Ontario County, budget	11,200

## ADULTS NOT TO BE QUARANTINED IN CERTAIN CASES

Frequent complaints are received by the Department regarding non-isolation of adults when the children of the household are afflicted with communicable diseases. Evidently there is a general misapprehension concerning the provisions of the sanitary code covering this point. Under regulation 12 of Chapter II of the code the quarantining of adults under certain conditions is not required. Except for smallpox, when a person is afflicted with a communicable disease adult members of the family who do not come in contact with the patient or with his secretions may continue their usual vocations unless forbidden by the health officer, provided that such vocations do not bring them into close contact with children. There are certain exceptions to this, however (regulations 37 and 39 of Chapter II), when the "usual vocation" includes the handling of milk or other food liable to convey infective material.

## CASES OF TUBERCULOSIS DURING 1923

Exclusive of Greater New York, there were reported in New York State 9,278 cases of tuberculosis last year. Eight thousand six hundred of these were pulmonary, and 678 were other forms of the disease. The total and the number of pulmonary cases reported are slightly greater than for the previous year, when of 9,009 reported cases 8,294 were pulmonary and 715 were other forms.

## FIRST PRENATAL CONSULTATION HELD IN SCHENECTADY

On February 1st the Division of Maternity, Infancy and Child Hygiene in co-operation with the Schenectady Health Department, held the first prenatal consultation in that city. The attendance was gratifying, especially because almost half the midwives of the city were present.

## CORRESPONDENCE

The Council at a meeting held in Albany April 20, 1922 moved, seconded and carried That the JOURNAL be not used to in any way suppress any expression of opinion, and that its correspondence columns be open for all proper communications and that "proper" communications will be deemed those which are not slanderous or libelous in their nature.

### RIGHT AND WRONG IN REGISTRATION

New York, March 6, 1924

MY DEAR EDITOR

In so far as I am acquainted with the proposed new medical practice act, I am in favor of all of its provisions excepting the re-registration of physicians and the payment of a tax in connection therewith. I shall direct my argument against these two features only, and particularly wish to avoid giving offense to anyone who holds an opinion differing from my own.

From a medical standpoint, the crying evil today in the State of New York is the unmodified, illegal practice of medicine by so-called chiropractors. The cure for this evil offered to the people of this State is a law which would require the annual re-registration of physicians—for at least five years—and the physician is to be taxed with a fee upon each re-registration. The actual cost of re-registration would evidently be merely nominal. The real purpose of the fee is to provide a fund to be used for the enforcement of the law. This seems to me to constitute class legislation. It is proposed to tax physicians only, in order to raise a fund to be spent for the benefit of the people at large.

How will re-registration make any other difference in relation to law enforcement? Today physicians are all registered to practice medicine legally, or they are not registered. What difference can there be in the status of a physician who is registered—and every member of County and State Societies is registered—what difference can there be when he is re-registered? If we are not registered at all we cannot practice medicine legally. If we are re-registered once or twenty times, what difference can it make except to make re-registration the occasion to milket us out of a fee?

But we are told the fee will be so small, we should not mind it. With this I beg to disagree. Our position should be based upon principle. Is this thing right or is it wrong? If it is wrong, let us follow the example of the patriots of the past and assert with all the vigor of our manhood and in a full consciousness of the fundamental principles of American liberty, "Millions for defense but not one cent for tribute."

There is a lot of talk about constructive legislation and about doctors always opposing everything. Once before I have pointed out that the representatives of our State Society within my memory had agreed to certain legislation, which

I named, and my statement was suppressed (after conference on the advisability of publishing what I then said). So tonight I will not mention the particular legislation referred to—But in my opinion the State Society made a mistake. It is hard enough for good citizens to submit to undesirable conditions imposed by a law already on the statute books—and I believe in submission to law until we can get it revoked—but I have no sympathy with politicians or medical politicians, who are willing to bargain, or trade, or compromise in regard to a proposed measure, not yet a law, to please anyone whomsoever, no matter how much we may be honored or flattered by representation on a Governor's Advisory Committee, or by any other consideration except the best interests of the people of the State of New York and of our great country, including the best interest of the medical profession.

Some twenty years ago our counsel, Mr. Clappe S. Andrews, was instrumental in convicting a notorious abortionist on a charge of "Attempting to commit an abortion." It is actually a crime to attempt to commit a crime. Hundreds of persons display signs bearing the word "Chiropractor." Last week, from the window of a car on the Culver Line in Brooklyn, I saw such a sign painted on the side of the third story of a house. Can there be any doubt in anyone's mind but that the person displaying that sign was holding himself (or herself) out to practice chiropractic? And our legal advisers assure us that such practice constitutes the practice of medicine. If that chiropractor is registered,—not one chance in a million,—but if he is, what is to prevent his re-registration?

Right now and first of all the people practicing medicine who should be suppressed, are those who are not and never have been registered. They are holding themselves out to practice medicine. Make them remove their signs. Don't tell me that the Governor the Mayor the Police Commissioner and the Health Commissioner, all combined, or any one of them have not the power or the means of suppressing this open offer to break the law and that a paltry assessment upon legally qualified physicians of the State is therefore necessary in order to pay the expense of getting the evidence to convict these people and put them out of business. They are guilty of a misdemeanor under the present law. Let anyone of the State and city officers

named serve notice on them to take down their signs, and note the effect. I believe this could be done tomorrow. It should have been done long ago. The evil of chiropractic and the "cults" should have been nipped in the bud. Instead of this, it has been allowed to grow big and powerful, while we were engaged in unnecessary, expensive, and fruitless "investigation."

J MILTON MABBOTT

[EDITOR'S NOTE In answer to Dr Mabbott's question, "How will re-registration assist law enforcement?" see page 396 of this issue. For comment on his question, "Is it right, or is it wrong?" see page 399 of this issue. In illustration of his suggestion regarding greater activity in investigating illegal practitioners, see page 378 of the March 14th issue.]

## MORE DELIBERATION SUGGESTED

Brooklyn, N Y, March 13, 1924

MY DEAR EDITOR

Under the terms of the Carroll-Lattin bill it is sought to amend the public health law in relation to the practice of medicine by requiring practising physicians throughout the State to register for a period of five consecutive years. The Medical Society of Bay Ridge is opposed to the passage of the Carroll-Lattin bill in its present form, for the following reasons:

1 Under the present law, Section 170, which is one of the sections sought to be amended, and under other laws prevailing in our State, physicians before they may practice must be licensed by the State Board of Regents, must register with the County Clerk of the county in which they reside or intend to practice, and with the local department of health, and are, therefore, already registered. If, as is claimed, the present records are not complete or up to date, or have been improperly kept, the power exists under the present law to enable those in authority to revise the same, and if funds are lacking in order to accomplish this, additional moneys can and should be appropriated therefor by the State. The physicians should not be burdened with this expense since it inures to the benefit of the general public.

2 We know of no good reasons why subdivision D of Section 170 of the present law, which gives the right to Regents to revoke the license or annul the registration, or do both, of a physician "who offers or undertakes by any manner or means to violate any of the provisions of Section 1142 of the Penal Law" should be eliminated in the present bill, particularly in view of the well-known fact that it was under this section of the penal law that a birth controllist was convicted and the conviction subsequently affirmed upon appeal.

3 From a careful reading of paragraphs 1, 2, 3 and 4 on pages 5, 6 and 7 of the proposed bill, it will be seen that no provision, mandatory or otherwise, is contained therein requiring the Board of Regents to issue a certificate of registration for the first year after a duly licensed physician has applied for the same. Paragraph 4 does state that a certificate of registration shall be issued, but reading that paragraph in

connection with paragraph 3, it will be found that such certificate must be furnished only after the first registration. In other words, there is no provision contained in paragraphs 1 and 2 requiring the Board of Regents to issue a certificate of registration for the first year.

4 The enactment of this bill into law will not prevent cultists from practising or attempting to practise medicine, and the provision therein making it a misdemeanor for physicians to practise without having obtained a license and being duly registered, applies also under this bill to those who are not physicians, namely, cultists, quacks and fakers, and should be changed as follows. Any person who is not a physician and after due trial is convicted of practising or attempting to practise medicine, should be punished as for a felony, and in the case of those who actually are physicians but are practising, or attempting to practise without a license or without being duly registered, they should, upon conviction, be punished as for a misdemeanor.

We also call your attention to the following important facts:

a In the issue of *NEW YORK STATE JOURNAL OF MEDICINE*, under date of February 29, 1924, at page 257, paragraph 2 thereof, in an editorial by Orrin S. Wightman, President of the State Medical Society, it is stated that the Carroll-Lattin bill has the endorsement of the said Society. This is not the fact, for the reason that no meeting of that Society or its delegates has been held since May, 1923, and therefore no such action could have been taken on this bill.

b According to the letter of Harold Rypins, M.D., Secretary of the Board of Medical Examiners of the University of the State of New York, published in the *NEW YORK STATE JOURNAL OF MEDICINE*, in the issue of March 7, 1924, on page 325, he states that there is in the Examination Division of the State Department of Education a complete alphabetical list of all physicians who have been licensed during the past 33 years.

c We know that the physicians throughout our State are interested individually and collectively in ferreting out those who are illegally practising medicine, and our Society and the Kings County Medical Society are making a

thorough canvass throughout Brooklyn, particularly we in the Bry Ridge section of that borough, for the purpose of definitely ascertaining the names of all those who are legally as well as illegally practising medicine. We expect very soon to have compiled and ready for submission to the proper authorities a complete list of the same. The result of this work, we believe, will be most effective and go a long way toward putting out of business all persons who are illegally practising medicine in our borough.

In conclusion, it is evident to us that this bill has been hastily drawn, that this being the physicians' busiest season, the medical profession at large has not had time or opportunity to give it that careful study which, because of its great importance to them, it deserves. We, therefore, suggest that action thereon be deferred in order that there may be an opportunity to submit and take up the entire subject at the annual meeting of the Medical Society of the State of New York, to be held in April of this year, at Rochester, and that a committee be then appointed which shall after diligent study of the present situa-

tion and thought as to the future of the public health, draft a bill which shall be submitted to the members of that Society and to the State Board of Regents not later than October 1 1924, when the subject can be thoroughly studied, discussed and digested, and put into proper shape for introduction at the session of the legislature in 1925.

Respectfully submitted,  
F C ELLIOTT M.D.,  
Secretary

[EDITOR'S NOTE: Dr Elliott raises the point whether or not the proposed Practice of Medicine Act has the endorsement of the Medical Society of the State of New York. It has the endorsements of the Council of the Medical Society of the Assistant Commissioner of Education who is also Director of Professional Education and of the Commissioner of Health of New York State. It is therefore correct to state that the bill has the endorsement of the Medical Society of the State of New York, of the Department of Education, and of the Department of Health.]

### SUGGESTS A CAMPAIGN OF EDUCATION

Lasalle, N. Y., March 10 1924

MY DEAR EDITOR

The idea of paying three dollars to re-register every year has irritated a large body of the profession into an attitude of skepticism toward any move which features such a proposal.

One of the main objections to the Annual Re-registration provision of the Amended Medical Practice Act is that the State is barking up the wrong tree.

It doesn't seem reasonable that the State Department of Education in answer to our complaint about the widespread activities of illegal practitioners, should suggest any further regulation of legal practitioners. Most doctors compare annual re-registration with reporting a series of crimes to the local police and having them direct all honest men to register every year. The average physician is opposed to any more restrictions. He feels that he has been sufficiently regulated as things are, and he certainly cannot be blamed for expecting that the State's efforts to regulate illegal practitioners won't center on him.

Furthermore he knows that the evil of fake-diploma mills is a proverbial drop in the bucket as compared with the number of chiropractors infesting every community. In Niagara County there is not one doctor practicing on a dead man's diploma or with one acquired from a mill. But there is a host of other illegal practitioners who won't be affected by re-registration, because they are able to do all sorts of damage without registering at all. If the State is going to do

anything about it, let the authorities move against the culprits instead of the complainants.

There is plenty of reason to believe that re-registration won't accomplish anything in any event. We all have had experience with its application to narcotic control by the Federal Government. Instead of regulating "dope," the Treasury Department has succeeded only in regulating doctors and druggists. In the meantime, a distinct impression prevails among informed people that the total amount of narcotics used by physicians the year around is but a small percentage of what smugglers bring across our borders every month.

Why must the State or Federal Government in its endeavor to regulate vice, always proceed against the respectable citizen? The answer is simple enough. It's easy to regulate doctors. Let him forget to dot an "i" on a narcotic requisition-form or let a druggist fail to put so much camphor in the paregoric that the baby is actually able to swallow a dose of it instead of half strangling to death, and you have two more "convictions" with which to pad up the annual report of what has been accomplished. We register every year, but the only effect of it is that the doctors of this country receive from the Treasury Department reams of regulations which succeed only in making them feel apprehensive of a long jail-sentence whenever they feel like prescribing a little morphine.

Why do we need any more laws? The present act is plain enough. There isn't a chiropractor who doesn't violate it every day. Doctors dis-

like the idea of paying three dollars a year to prosecute people when it's the State's duty, and clearly within its police powers to suppress all illegal practitioners

If our prosecutors are unable to secure convictions under present laws, the fault lies in the medical profession's policy of hiding its light under a bushel while the cults pack the juries. When the local District Attorney prosecuted two recent cases, the juries saw fit to disregard the facts because some of the jurymen "knew that chiropractors had helped friends of theirs"

No Medical Practice Act will educate the public. The man on the street is confronted with cultist propaganda which he doesn't forget when called for jury duty.

Having prosecutors sent from Albany won't affect the juries. If they choose to ignore the evidence of county prosecutors, is there any reason to believe that they will regard differently the same evidence presented by a man from Albany? If the cultists can bring pressure to bear on local prosecutors, why can't their lobbyists do the same to a State prosecutor?

As long as public opinion continues to favor violators of laws, which in most cases cannot be enforced, and have no teeth when they are enforced, it seems useless to continue attempted solution of the problem along the same lines. Energetic prosecution of more stringent laws will simply enhance the popular idea that irregular practitioners are merely being persecuted by a sore-headed medical profession, while giving them further opportunity to pose as martyrs will defeat the very purposes we hope to accomplish.

Since these matters boil right down to what the public thinks about them as expressed in jury verdicts, far better to lay emphasis on a campaign of education, increase State Society dues, revise the section dealing with medical advertising, and lay the proposition squarely before the people.

There isn't one doctor in a hundred who doesn't feel that the medical profession is fifty years behind the times in the matter of publicity, that we have been going backwards, that the time has come, not for any "I Cure Men" appeals by individuals, but for truthful and dignified group advertising by State and County Societies.

R. H. SHERWOOD, M. D.

[EDITOR'S NOTE For some of the effects of the Federal Narcotic Law, to which Dr. Sherwood refers, see the article beginning on page 392 of this issue.]

## FAVORS PRACTICE OF MEDICINE ACT

ONEIDA MEDICAL CLUB

Oneida, N. Y., March 14, 1924

MY DEAR EDITOR

In behalf of the Oneida Medical Club, may I be permitted to correct the impression that Madison County physicians are opposed to the Medical Practice Act? The County Society is listed in the opposed column, although, as the JOURNAL indicates, no vote has been taken to prove this. Our information, we believe, proves the contrary. We have fourteen Madison County members in the Oneida Club, who have voted unanimously in favor of the proposed Medical Practice Act, and certain other physicians in the county are known by us to be in favor of the Act.

From these two facts, we have no doubt that in reality there is a fair-sized majority of the County Society in favor of the bill. The Oneida members alone, it may be added, constitute a majority at most County Society meetings. It is not, in other words, a question of "opposed" or "in favor," but rather how large the majority in favor would prove to be.

Very truly yours,

ROGER R. LOUGH, M. D.,  
Secretary of Oneida Medical Club

# THE DAILY PRESS

**EDITOR'S NOTE** We are trying to make the Department of Daily Press a reflection of the medical news articles that appear in the daily newspapers. We subscribe to a clipping service and doubtless miss many articles, especially those in the smaller villages. But yet those which we receive are probably fair samples of those which are used in the newspapers.

We are struck with the fact that seldom do we find any mention of meetings of Medical Societies. This omission is probably due to the failure of the societies to make proper publicity of the records of the meetings. The acts of medical societies of both counties and sections of counties, are of great civic importance and are well worthy of space in the local newspapers.

In contrast with the reticence of physicians regarding their organizations is the wide publicity that is given to the doings of public health organizations. The societies for promoting public health depend on the education of the public, and so they maintain publicity bureaus in order to obtain space in the newspapers at an early date while the matter is fresh and timely. These organizations appear in the daily newspapers fifty times to the medical organizations once. This accounts for the apparent excess of items regarding public health organizations that appear in the Department of Daily Press.

The meeting called by the Governor to discuss the medical needs of rural communities resulted in the decision that snowed in roads during winter months constituted the principal element in the lack of medical attention that is given to rural residents. The Rome Sentinel of March 3rd and 4th contains a description of the way in which the problem of transportation over deep snow has been solved by Dr. G. Lewis, of Vernon, President of the Medical Society of the County of Oneida. The article describes the 'Snowmobile' which Dr. Lewis had built. Its driving apparatus consisted of a caterpillar tractor fitted to the rear end of a Ford coupé while its front axles are supported on skis, which are attached in place of the front wheels. The article states that Dr. Lewis had made the trip from Vernon to Rome, a distance of over ten miles, in 48 minutes over a road full of snowdrifts that are usually considered impassable. The Sentinel comments:

Such a machine ought to prove invaluable for years to come on back country roads even should a workable system be developed for keeping the main highways open throughout the winter for wheeled automobiles of similar type. City phy-

sicians who have been withdrawing from winter practice in the country, to the consternation of the rural population may well follow Dr. Lewis' example and ambulances can be similarly rigged for transporting patients to the town hospitals.

But is it not possible that it may prove more practicable for automobile owners to stock up with winter and summer cars, just as horse owners used to have sleighs and wheeled vehicles, than for the community, whether state, county or town to maintain open roads for wheeled cars throughout the prolonged period of snow? That a type of truck and passenger car can be developed permitting the substitution of winter equipment for the summer's wheels is also among the possibilities.

It would seem that Dr. Lewis has made a definite contribution toward solving the problem of rural medical attendance and that the State of New York might provide rural health officers with Dr. Lewis' tractors provided they will attend sick persons whom physicians could not ordinarily reach.

The newspapers give an abundance of publicity to the children's Health Consultations which are being held throughout the State under the auspices of the State Department of Health and the local health officers. The *Batavia News*, March 1st, gives nearly a column to a description of the preparations for a two-day consultation in the City Hall. A local committee will secure the attendance of children needing examinations, and will see that the children who are found defective are given proper treatment. This treatment is always to be given by the family physician if possible.

These consultations are great feeders of cases to family physicians. The methods of conducting the consultations have been perfected, and great care is always taken to send word to the family physician when any defect is found. The consultations reach a class of persons who do not patronize any physician regularly, and when they are asked who is their family doctor, they say they have none. They are always urged to advise a doctor and to take their defective children to him for further examination and for treatment. No treatments are ever given in the consultations.

The *Times* and the *Standard* of Watertown, both contain an account of a talk given before a mothers' Health Club that had been organized by one of the public health nurses that work in the county. The two articles are identical, and

claimed that the action of the Board of Supervisors in appointing three public health nurses for Jefferson County was the result of the work of the public health nurse. Our previous information was that the nurses were appointed as the result of the initiation taken by the Jefferson County Medical Society (see page 427) of this Journal. This seems to be an example of one-sided publicity carried on by organizations of the kind which are mentioned in our editorial note at the beginning of the Daily Press pages

The Jamestown Post March 5th, contains the pointed remarks made by Health Officer John J. Mahoney regarding the scarlet fever situation which Dr. Mahoney says is becoming a menace to the city. About a dozen cases a day are reported and this means another dozen or two go unreported. Dr. Mahoney calls attention to the inadequate facilities which he has for handling the situation. He calls attention to the sore throats of the children and of the custom of allowing the children to return to school if a culture shows no diphtheria germs. The article explained the signs and symptoms of scarlet fever and urged that children with the symptoms be excluded from the schools.

Dr. Mahoney may well be worried over the problem of stopping a scarlet fever epidemic that affects school children. A fundamental requirement is that of *accounting for every school child every day* in order to discover and isolate the cases. To do this requires a considerable staff of nurses, but the expense is minimized when it is done at the outset.

The Buffalo News, March 6th, has a heading "cure for scarlet fever promised." This is an account of the experiments done at Yale Medical School, the Rockefeller Institute, and the McCormick Institute of Infectious Diseases, and other investigators. It mentions the method of diagnosis by the injection of a drop of serum from a recently recovered case into the reddened skin,—a blanching of the injected area is supposed to indicate scarlet fever. The article also mentions the use of a curative serum. Articles on this same subject have been appearing in other daily newspapers.

The Middletown Times, February 20th, contains a column and a half account of an address by District State Health Officer Laidlaw on Diphtheria Prevention. It was given before the Central Council of the Parent Teachers' Association. Dr. Laidlaw described the excellent results of the toxin antitoxin immunizations which

have been given in Orange and Ulster counties during the last two years. Two Middletown physicians spoke of the unanimous endorsement which the doctors of the city had given to the immunization campaign.

The Troy Record, February 28th, contains a news item stating that the State Department of Health had approved the application of the Watervliet city officials for an appropriation of funds under the Shephard-Towner Act in order to establish a maternity and child hygiene clinic. The physician who attends at the clinic will be paid out of the funds. The article states that the funds had been intended for places having high infant mortality rates, and it continues "Watervliet was not one of the municipalities eligible to benefit by this fund until recently, and its chance came when some of the eighteen or twenty eligible cities failed to make the application." Watervliet doubtless can make good use of the funds even though a high infant mortality is not admitted.

The Olean Times, February 23rd, contains an editorial commenting on the fact that the people of the United States pay \$3.08 per capita annually for medicines, and 56 cents for all forms of public health work—Federal, State, and Municipal. The editorial concludes "Health is manifested not merely by dodging disease, but by the enjoyment of living. Increasing the 56-cent item would mean increasing that enjoyment."

The subject of protection against whooping cough is presented clearly and sanely in the February 28th issue of the White Plains Reporter. It gives the arguments for the exclusion from schools of every child with mild symptoms of whooping cough, but it goes much further and says that merely keeping a child out of school is not enough. It does no good to keep Johnnie out of the classroom and then march him to the barber shop to get his hair cut. The most effective co-operation will be possible only when mothers agree to completely subordinate their own feelings for the good of the community. The article suggests "ticketing" the patient in order to warn other children. Every health officer is painfully aware of the selfishness and callousness that are frequently shown by parents of children with whooping cough, measles, and other so-called "mild" diseases—and major ones, too.

## NEWS NOTES

### PUBLIC HEALTH ACTIVITIES OF THE JEFFERSON COUNTY MEDICAL SOCIETY

**EDITOR'S NOTE** In our Daily Press Department of February 29th, we mentioned a newspaper report about the action of the Jefferson County Medical Society in securing three public health nurses for the county. This action was so original and indicated such progressive action that we wrote for further information, and have received the following reply, which may stimulate some other societies to take the initiative in community medicine.

Watertown, N. Y., March 15 1924

MY DEAR EDITOR About a year ago the attention of our Society was called to the five year report of Dr. Eichel, which set forth the mortality rates for mothers and infants in New York State. That report disclosed the fact that these rates in our county are among the highest in the state. We were surprised and piqued. We appointed a committee to investigate, and the committee's report corresponded closely with the figures of the State statistician.

At about the same time we were advised of the assistance offered by the Division of Maternity, Infancy, and Child Hygiene, for organizing educational and welfare work for mothers and infants. Their plan stood the test of thorough investigation, nothing unethical could be found in it, and we concluded that, with our co-operation with the State Department, and with the continued guidance of local work by our Medical Society, much good might be gained to the community.

We therefore passed a resolution, addressed to the board of supervisors urging them to provide funds for public health nurses. With the aid of representatives of the Department of Health, we have pressed this program. Work on a county-wide basis is partially organized, and an appropriation sufficient to employ three nurses with conveyances, has been made. The program calls for a supervising nurse to take the responsibility of the work as a whole, and a zoning of the county, according to the nurses employed, to prevent over-lapping and unnecessary travel. Each nurse is to do general public health nursing.

A special committee of supervisors will employ and maintain the nurses. The Board of Supervisors also decided to give their committee the supervision of the nurses' work. They will do this with the assistance of a medical advisory

committee consisting of three members of our County Society, appointed by the Chairman of the Board. This medical advisory committee will pass upon the qualifications of the nurses employed, see that proper ethics is maintained and that the work is done in a manner agreeable to the physicians. The supervisors have shown us splendid courtesy and deference.

A canvass of all physicians practising in the county was made. Response was obtained from about seventy per cent, and, of these, about ninety-five per cent were in favor of the work. We intend to lower our mortality rates for mothers and infants.

Why did we take the initiative?

1 Because it is a medical problem, and therefore needs our interest and guidance.

2 Because the program seems to offer a desirable kind of nursing assistance, which is especially needed in rural sections where doctors are few.

3 Because it will lead to improvement in our own obstetrical and pediatric work, along the lines suggested in "Standards of Maternity Care," which was issued to physicians by the Department of Health.

4 Because we recognize that the trend of medicine is steadily toward PREVENTION. In order to take advantage of newly discovered truths and keep up with the general progress, certain things must be done a bit differently, even in medicine, and new measures may need to be employed. However, we believe that with care and supervision these changes and innovations can be safely made. In this particular instance, we saw the movement coming and preferred to attempt leadership, rather than have the program forced upon us. And

5 Last, but not least, our membership saw in this field an opportunity for community service. Should any further information be desired, we will gladly supply it.

We thank you for this interest in our effort.

Very truly yours,

Publicity Committee of Jefferson County Medical Society,

PAGE E. THORNHILL, Chairman,  
NORMAN L. HAWKINS,  
ELMER E. EDDY

## MEDICAL SOCIETY OF THE COUNTY OF ALBANY

The regular meeting of the Medical Society of the County of Albany held on March 11, 1924, at the auditorium of the Municipal Gas Company, 124 State Street, Albany, N. Y., was opened by Dr. Edgar A. Vander Veer, President. Forty-three members of the society were present.

Dr. Lyle A. Sutton, Albany, N. Y., was elected a member.

Dr. George S. Amsden of White Plains, N. Y., was transferred from the Westchester County Medical Society to this society.

### Scientific Program

"Acute Generalizing Peritonitis," Walter Gray Crump, M.D., New York City.

Discussion opened by A. S. Van Loon, M.D., Albany, N. Y., and F. MacD. Stanton, M.D., Schenectady, N. Y.

"Some Legislative Problems," Senator William Lathrop Love, M.D., Brooklyn, N. Y.

Discussion by Dr. James N. Vander Veer, Dr. Thomas Jenkins and Dr. Harold Rypins, of Albany, N. Y.

A rising vote of thanks was given to Doctors Crump and Love for presenting their excellent papers.

## SCHUYLER COUNTY MEDICAL SOCIETY

A meeting of the Schuyler County Medical Society was held at The Glen Springs, Watkins, on January 8, 1924, Dr. Albert Warren Ferris presiding.

The members voted to approve the resolution to register physicians in the State, endorsing the principle involved. Dr. Rollin O. Baker of Montour Falls was elected president, Dr. F. B. Bond of Burdett, secretary, and Dr. J. M. Quirk of Watkins, treasurer. Dr. Allen W. Holmes of Watkins was chosen delegate, and Dr. Albert Warren Ferris of Watkins, alternate, to the an-

nual meeting of the State Medical Society. The censors continue to be Drs. Ferris, Quirk and King of Watkins, and the committee on legislation continues as follows: Drs. Quirk and Ferris of Watkins, and Dr. Baker of Montour Falls. The paper of the evening was delivered by Dr. William S. Alsever of Syracuse, and its title was "Treatment of Heart Disease," which was discussed by several, including visitors from Elmira and Ithaca.

A collation was served by The Glen Springs.

## MEDICAL SOCIETY OF THE COUNTY OF CATTARAUGUS

At the last regular meeting of the Medical Society of Cattaraugus County, the society voted unanimously to go on record as opposing re-

registration, but it also went on record as favoring action by the Attorney-General against illegal practitioners.

## BOOK REVIEWS

**PHYSIOTHERAPY TECHNIC A MANUAL OF APPLIED PHYSICS** By C. M. SAMPTON, M.D. formerly of the Physiotherapy Service, Walter Reed U. S. Army General Hospital, Washington, D. C., formerly Chief of Physiotherapy Service, U. S. Army General Hospitals No. 9 Lakewood, N. J., and No. 41 Fox Hills Staten Island N. Y. With 85 illustrations. C. V. Mosby Company St. Louis, 1923. Price \$6.50.

Physiotherapy is a branch of therapeutics which has rapidly advanced to a foremost place in medical practice in the past few years. The World War with its vast numbers of disabled men requiring rehabilitation or reconstruction quite naturally was the most important factor in bringing it to the front. The author had unusually good opportunity to acquire experience and work out problems in this field through his work at the Walter Reed U. S. Army General Hospital at Washington and in several other army hospitals, so his views and methods must carry great weight.

He groups the various physical remedies under four general heads namely Thermal Chemical Mechanical and Electronic. As might be expected the last of these four received the most attention in the text—High Frequency Diathermy, Autocondensation, Static Modalities, Actinotherapy, Smusoidal Currents, X ray Therapy, Faradic and Galvanic Currents etc.

There are important chapters on Massage, Hydrotherapy, Arthritis and Locomotor Ataxia. The illustrations both diagrammatic and photographic, are both numerous and valuable in explaining the reading matter.

Publications of this nature and merit will do much to instruct the medical profession in a very important field of treatment.

WILLIAM H. BAYLES

**DISEASES OF THE SKIN** by RICHARD L. SUTTON, M.D. LL.D., Professor Diseases of the Skin University Kansas School Medicine Dermatologist, Christian Church Hospital. One thousand sixty nine illustrations eleven colored plates. Fifth Edition Revised and enlarged. C. V. Mosby Co., St. Louis 1923. Price, \$10.00.

This is the fifth edition of Sutton's monumental treatise on dermatology since its first presentation in 1916. As the work of one of the leading dermatologists of this country its review can be little else than an enumeration of its many wonderful contents. With the possible exception of the colored plates the illustrations are most excellent—they are well chosen and typical of the lesions described. It is possible that there is no other branch of medicine in which photography is so valuable an adjunct as in dermatology and Dr. Sutton is to be congratulated on the selection of splendid illustrations which in many instances show every phase and type of the lesion described. The colored plates are mainly from watercolor sketches well done no doubt in the original but poorly colored in the printing. The microphotographs which are many and beautifully executed, add much to the value of the book to the student. The publishers are to be thanked for the physical excellence of the work. The printing is superb on heavy stock and the difficult task of halftone reproduction has been well executed. Dr. Sutton's book is a necessity with every dermatologist, and to the general practitioner its possession means that he has at hand the latest the best and the fullest information on this subject.

NATHAN T. BEERS

**EXERCISE FOR HEALTH AND CORRECTION** By FRANK D. DICKSON M.D., and REX L. DIVLEY, M.D. J. B. Lippincott Company Philadelphia and London, 1923. \$2.00.

The writers have produced a condensed manual which really consists of a series of photographs with just enough text or reading matter to explain the photographs.

The exercises have been divided into five groups, namely Bed Exercises, Settling up Exercises, Postural Exercises in the Recumbent Position, Postural Exercises (Standing) and Foot Exercises. To avoid complexity the number of exercises in each group has been reduced to a minimum furthermore, those exercises which are used in the treatment of scoliosis or curvature of the spine have been purposely omitted as they require the supervision of a trained instructor and this work is really intended mainly as a guide for self instruction.

Points worthy of commendation are the excellence and clarity of the photographs and the brevity and practical nature of the text.

WM. HENRY DONNELLY

**A MANUAL OF HISTOLOGY**, by V. H. MOTTRAM, M.A. Professor Physiology University of London. 224 Diagrams. E. P. Dutton & Co. New York, 1923. Price \$6.00.

This book is somewhat of a departure from the usual text book on Histology. The author has employed uniform line-drawings of high and low magnification, in order that the work may be used both as a text and laboratory manual. The essentials of General Histology are covered briefly and lucidly. The more difficult and controversial subjects are left to the demonstrator. The subject matter has been arranged according to the functional unit of the organ, physiological and anatomical relationship being emphasized. We can recommend it as an excellent up-to-date work for students upon Histology.

HENRY A. SUSSMAN

**LES PROCESSUS DE DÉSINTÉGRATION NERVEUSE.** DR. IVAN BERTRAND, Chef de Laboratoire à la Faculté de Médecine de Paris. Préface du Professeur Pierre Marie. Masson et Cie, Éditeurs, Libraires de l'Académie de Médecine, 120 Boulevard Saint Germain, Paris. 1923. This work deals in rather a new and philosophic manner with the normal and pathologic histology of the nervous system. It should be of considerable value to the laboratory worker in that field, as the description of the technical procedures is very complete.

I. FREDERIC DANRAU

**AN INTRODUCTION TO THE STUDY OF MENTAL DISORDERS** by FRANK M. BARNES JR. M.A., M.D. Associate Professor Nervous and Mental Diseases St. Louis University Medical School Neurologist to St. Mary's Hospital Consultant Psychiatrist to the St. Louis City Sanatorium. Second Edition. C. V. Mosby Co., St. Louis 1923. Price, \$3.75.

As the author states "Psychiatry is and has been always the least understood of all the medical sciences."

This book promises much for a better understanding by the general medical practitioner, the psychiatric social worker and the medical student as to the part mental disorder plays in medicine and in our social life and structure.

The contents are divided into two parts the first being devoted to an outline of psychiatric fundamentals.

The second part of the book is devoted to a discussion of the various clinical groups and varieties of mental disorders

Special chapters include mental hygiene and social psychiatry and a consideration of mental states with endocrine disorders

Logically, the psychoneuroses based as they are upon mental disorder or maladjustment, are included and adequately discussed. The author in writing of these conditions uses the term "diseases" which he apparently uses interchangeably with "disorders." Terminology leading to a conception of the psychoneuroses being considered and spoken of as mental diseases would be apt to react unfortunately upon the patient in particular and the laity in general, and subscribing to the theory that in the psychoneuroses, the nervous system remains intact, not being attacked by disease, but being out of order, the exclusive use of the term disorder may be considered preferable.

One already familiar with the fundamentals and field of psychiatry may find more amplified and diverse information in other text-books and scattered through the literature, but it is usually highly technical in character and presentation, however we know of no more instructive or entertaining volume for the neophyte in psychiatry than Dr Barnes' book

LAURENT FEINIER.

DIAGNOSTIC METHODS, A GUIDE FOR HISTORY TAKING, MAKING OF ROUTINE PHYSICAL EXAMINATIONS AND THE USUAL LABORATORY TESTS NECESSARY FOR STUDENTS IN CLINICAL PATHOLOGY, HOSPITAL INTERNES, AND PRACTICING PHYSICIANS, by HERBERT THOMAS BROOKS, A.B., M.D., F.A.C.P., Professor Clinical Medicine, College Medical Evangelists, Los Angeles, Cal. Fourth Edition, with Fifty-two Illustrations. C V Mosby Co., St. Louis, 1923. Price, \$1.75

The reviewer endorses the author's statement in his preface to this fourth edition, in that each chapter is clearly written, well defined, and the technic of the tests are simple

The first chapter gives a complete outline of how to take a history from a patient, and the second chapter is confined to the physical examination of the patient. If these outlines were followed as given, fewer errors in diagnosis would be made.

The rest of the chapters deal with the examination of sputum, urine, blood, gastric contents, feces, serous fluids, etc. These chapters are described briefly but very comprehensively

The chapters on the Wassermann reaction and complement fixation for gonorrhea are well and simply written

The reviewer feels that this little book of only 108 pages and its few illustrations may be of more value to the general practitioner than similar books ten times its size

S J COHEN

PARKES & KENWOOD'S HYGIENE AND PUBLIC HEALTH, by LEWIS C PARKES, M.D., D.P.H., the Consulting Sanitary Adviser to H. M. Office of Works, and HENRY R. KENWOOD, C.M.G., M.B., Professor of Hygiene, University of London. 7th edition, 90 illustrations. XI, 783 pages. P. Blakiston's Son & Co., Phila. 1923. Cloth, \$7.00

This seventh edition has been revised and enlarged and brought up to date. It contains 783 pages, including an index. The fourteen chapters cover in relatively brief fashion the following subjects: Water, The Collection, Removal and Disposal of Excretal and other Refuse, Air and Ventilation, Warming and Lighting, Soils and Building Sites, Climate and Meteorology, Exercise, Clothing, Personal Hygiene, Food, Beverages, Condiments, Infection, Communicable Diseases and their Prevention, Hospitals, Maternity and Child Welfare, School Hygiene, Disinfection, Statistics

The general style of the book is good and it is to be recommended as a useful treatise for medical men who do not desire so exhaustive a work as that of Victor Vaughan. The authors have condensed a great deal of material into a relatively small space, which bears evidence of accuracy and is typically English. The chapter on Statistics is particularly interesting. It should be found very useful as a text book and compact work of reference for field workers

J M V C.

PHYSICAL EXAMINATION AND DIAGNOSTIC ANATOMY, by CHARLES B. SLADE, M.D. Third edition, thoroughly revised. 12mo of 179 pages, illustrated. Philadelphia and London: W. B. Saunders Co., 1923. Cloth, \$2.00

This book contains the elements of physical diagnosis of the normal individual with an occasional reference to an abnormal condition to keep the interest of the student.

The purpose of the book is to aid the teacher of Physical Diagnoses with a "minimum of text book study"

S A S

CLINICAL DIAGNOSIS BY LABORATORY METHODS. A Working Manual of Clinical Pathology, by JAMES CAMPBELL TODD, M.D. Fifth edition, revised, enlarged and reset. Octavo volume of 762 pages, illustrated. Philadelphia and London: W. B. Saunders Co., 1923. Cloth, \$6.00

Every physician is undoubtedly acquainted with Todd's work on this subject. The fifth edition of this book is a boon to the medical profession. The reviewer feels that neither the busy practitioner, the laboratory worker, nor the medical student can afford not to have this book. It contains chapters on Blood, Urine, Gastric and Duodenal content, Feces, Animal parasites, Serodiagnostic methods, Bacteriology, Vaccines etc. All the chapters are well described, and contain everything one may want to know about laboratory examinations

The best laboratory methods have been carefully selected by the author, and all are up to date

It is surprising that such a little book contains such a vast amount of information essential to the daily routine of the busy doctor, and such great help to the medical student

S J COHEN

THE BIRTH OF PSYCHE. By L. CHARLES-BAUDOUIN. Translated by FRED ROTHWELL. George Routledge & Sons, Ltd., London, E. P. Dutton & Co., New York, 1923

To assign this little volume of poetic inspirations to the present reviewer was to cast pearls before swine. Being unfamiliar with the standing of the author as a poet, the reviewer cannot tell whether the poetry is good or bad. The only thing that he has to go by is the fact that the author himself admits that it is good, but still he may be mistaken

"With the precision of the scientist, and with the esthetic certainty of the poet, M. Charles-Baudouin draws for us in twenty-four touching and curious sketches of child-life his own childhood—life as experienced by an imaginative and sensitive child just awakening to the reality and nature of things outside himself." To one the birth of whose psyche centered about episodes of stealing fruit and smashing windows, the psychic loveliness depicted in these sketches appears incomprehensible. The suspicion arises that perhaps the "noble sentiments" expressed are the illusory investiture with which the poet clothes things mundane. Who knows but that Penrod himself, writing his autobiography in his later years, may remember himself as he will then remember a good boy should have been, and depict his boyhood as that of a young gentleman

FREDERICK DAMRAU

**IMPOTENCY, STERILITY AND ARTIFICIAL IMPREGNATION** By FRANK P. DAVIS, Ph.D., M.D., Fellow American Biological Association. Second Edition, Revised and Enlarged. C. V. Mosby Co., St. Louis, 1923. Price \$2.25.

This small book of 150 pages contains a small amount of well known information, pleasantly told for those who do not care for more profound works. It is a very useful primer on the subject.

J. STURDIVANT READ

**PRACTICAL DIETETICS WITH REFERENCE TO DIET IN HEALTH AND DISEASE.** By ALIDA FRANCES PATTEE. Graduate Department of Household Arts, State Normal School, Framingham Mass. Fourteenth Edition completely revised. A. F. Pattee, Publisher Mount Vernon, New York, 1923.

**TEACHER'S DIETETIC GUIDE.** To accompany Pattee's Practical Dietetics. Given gratis with each copy of Pattee's Practical Dietetics.

This newly revised edition is a most valuable and instructive book for any physician.

In a concise manner it details all of the standard diets in use in certain pathological conditions.

It also contains chapters detailing the percentage composition of all foods and specially prepared recipes that one will find useful.

It is a splendid small reference book on dietetics containing a wealth of practical information.

CHARLES EDWARD HAMILTON

**A MANUAL OF ARTIFICIAL RESPIRATION** By Capt G. R. G. FISHER, Director Bureau of First Aid Northern Division American Red Cross. The Stratford Co., Boston Mass., 1923. 75c.

In this small volume the author presents in a very clear and readable style, the classical methods of resuscitating those who have stopped breathing and are "apparently dead." Actual photographs are freely used to indicate the different steps on the Sylvester and Schaefer methods of artificial respiration while in the text the author presents a number of important points to be kept in mind by those who are supervising the resuscitation.

Above all the reader is urged not to become discouraged too soon in his efforts to revive victims of asphyxia. The author records several cases that were pronounced "dead" by physicians but were revived by laymen who used artificial respiration for a long period of time.

FRANK E. MALLON

**THE VENTILATION OF PUBLIC BUILDINGS** By ROBERT BOYLE. Published by Robert Boyle & Son London 1923. 12 mo. of 51 pages, illustrated. Price, 6 shillings.

This is a very brief collection of quotations from various sources dealing with the problem of ventilation.

E. H. M.

**THE TREATMENT OF DIABETES MELLITUS WITH OBSERVATIONS BASED UPON THREE THOUSAND CASES** by ELLIOTT P. JOSLIN, M.D. Third edition enlarged, revised and rewritten. Octavo of 784 pages illustrated. Philadelphia and New York. Lea & Febiger 1923. Cloth, \$8.00.

In his latest volume Doctor Joslin, presents in a most careful and masterly manner, a complete summary of the subject. He includes not only the rich fund of clinical

data of his previous volume, but all of the recent data and re-reads his old experiences in the terms of the new. A comprehensive history of insulin and its discovery is given, and in addition the details, directions and indications for its use are minutely outlined. Throughout the author gives not only his own evidence but cites the observations of other workers. He does this without prejudice and records his own judgements in the same instances.

The charts and tables are the best and most comprehensive of any that we know and render the volume invaluable on account of these working details. If one wishes to care for a diabetic, following him in every detail, the way is indicated and at the same time, for those who do not have access to means for such detailed study the directions for the best possible treatment of a diabetic, mild or acute in any emergency are there, presented simply but in full detail. Whoever wishes the last word in diabetes, as a matter of information or the latest advances in caring for diabetics should have this volume. It is certainly the peer of any single volume on the subject in any language.

LOUIS C. JOHNSON

**GYNECOLOGY** by WILLIAM P. GRAVES, A.B. M.D. F.A.C.S. Third edition, thoroughly revised. Octavo volume of 936 pages with 388 illustrations and 146 microscopic drawings. Philadelphia and London. W. B. Saunders Co., 1923. Cloth \$9.00.

A review of this book leaves but the happiest of impressions with the reviewer.

The arrangement of the book is logical and each subject has received its just apportionment of space and consideration. The book is printed on excellent paper the type large and clear and no small value can be given to the numerous and excellent illustrations, for the most part drawn by the author.

Part one deals with the physiology of the pelvic organs and with the relationship of gynecology to the general organism. This section to the reviewer's opinion is very well balanced. Little or no guess work is found here but only those points that tend to show the relationship of the endocrines are brought out, and for the most part the statements made are backed by experimental evidence. This section can well be reviewed by all as the author has at no time allowed himself to deal with speculation, but rather has tried to correlate those facts that time and experiment have proved of value.

Part two is designed for the undergraduate. This section is of greatest value for its clarity not only on the clinical side but for the clear cut definitions and well worded descriptions of the pathology offered.

Part three is devoted exclusively to the technique of gynecologic surgery. Let it be said that the technique of dozens of operations designed to correct the same abnormality or pathological condition has not been given, but only those that the author feels of greatest value. As is well known, the seque of an operation is of much greater value than simply reading about it and in this respect the excellent illustrations afford one a very graphic method of studying such procedures.

There are points where one is inclined to differ but a book of this size would lack individuality, to say the least if we could all agree with it in all things.

In closing the reviewer feels that the book is of value to the teacher for the first section alone to the student for the clear cut and rational treatment of the subject matter and for the general practitioner as an excellent source of reference.

## INFERIOR COMPLEX BASIS FOR 'KNOCKER'

### Blustering Manner and Arrogance Are Used to Smother Psychic Makeup, Analyst Finds

They say that the scorpion would be a dear little fellow and a most interesting pet, if it would only cure itself of one deplorable habit. But unfortunately, like certain otherwise admirable people, it is angry with the universe. From the moment it hatches out, the baby scorpion cocks its tail over its head and rushes hither and thither looking for some one to sting.

That's the kind of a bird Blathers is. Blathers can keep a group of fellows entertained a whole afternoon by the fluency, the deadly persistence and the corrosive skill with which he will sting one reputation to death after another.

At a dinner party or the opera Blathers carries on in exactly the same way, and as he almost always manages to be amusing about it—they say that it's quite amusing also to watch a scorpion going about its business—he has come to be looked upon as a licensed common scold. There is something almost automatic in the way he responds to a cue, and callow youths sometimes prick him on by some such stimulus as

"Oh, Blathers, what do you think of So and So?"

Then you will see Blathers' mouth fly open, and with the precision of a nickel in the slot machine he will reel off a scaring characterization of the personage mentioned. And if he doesn't get a laugh he feels he has failed and shivers a little at the thought that he is growing old.

Not long ago he found himself being studied with great interest by a physician who had known him as a young fellow and who had recently returned from Europe after some years of post graduate study in the newer branches of soul exploration.

"Blathers, it's wonderful how you have kept it up all these years, but it's beginning to tell on you now," said the doctor one day, catching Blathers alone after one of his regular performances.

"How do you mean, Jim?" asked Blathers, turning away about the gills.

"I don't want to alarm you, old chap," said the doctor kindly, "but I would like to cure you."

"Cure me of what?" demanded Blathers hoarsely.

"Do you mean that my heart—my kidneys—"

### Trying to Overcome Complex

"Not at all," said the doctor. "I'm not interested in your organs, only in your psyche. A fellow can't go on knocking the human race for half a lifetime without having something injurious pressing upon his soul, or his subconsciousness or whatever you choose to call it. I'd like to analyze you for old time's sake and to verify the conclusions I've been forming about you. I'll help you to get rid of that inferiority complex."

"Inferiority what?" blustered Blathers. "That's about the last thing you'll find in me!"

"On the contrary," said the doctor, "it's probably one of the most salient things about you. Most of the other kids could lick you—do you remember?—and that was enough to give you an inferiority complex that you have tried to smother beneath a blustering manner and an arrogant habit of whacking at every head that raised itself above the level of the crowd."

And now Blathers is thinking about it very deeply, trying to make up his mind to be analyzed, but dreadfully afraid of what he may find out about himself.

## Village Stuff

"Say, how come old Robinson got well so consarned quick?" Thought he was gonna kick the bucket last week."

Well, you see, it was this way. He got wind that young wife of his'n was gittin' too daw-gone friendly with the undertaker"—*American Legion Weekly*

## Dangerous Handicap

Tommy had sprained his wrist and didn't want to go to school.

"But your wrist is nicely bandaged," urged his mother. "It won't prevent you from attending classes."

Still the boy held back. Dad took a hand at this point.

"Now speak up, son," commanded his father. "Let's have the real reason. Why don't you want to go to school with a sprained wrist?"

"Too many boys owe me a licking"—*Louisville Courier-Journal*

## Already Had 'Em

A negro woman of mammoth proportions and inky complexion was in an automobile accident. She was transported to the hospital, where she soon regained consciousness. The doctor, seeking to comfort her a bit, said to her:

"You will undoubtedly be able to obtain a considerable amount of damages, Mrs. Johnson."

"Damages," said Mrs. Johnson. "What Ah want wit damages? Ah got enough damages now. What Ah wants is repairs."—*Everybody's Magazine*

## Disgruntled

"What's the matter now, Grumps?"

"My daughter is wearing knickerbockers and my son is taking a girl's part in the college play."—*Louisville Courier-Journal*

## Burning Words

*Lady Visitor at Hospital*—And what were your first words on recovering consciousness after the auto hit you?

*Victim*—Oh, they wouldn't stand for me sayin' any thing like that here, Lady!

## A Correct Diagnosis

The Universe and the Philosopher sat and studied each other for eighty years, and then both remarked in the same breath: "I'm damned if I can make anything of you!"—*Don Marguis (New York Tribune)*

## Now Do You See?

Holding her close to him, he gazed into the unfathomable depths of her wonderful eyes. Acute anxiety was expressed in every line of her fair face. Ever and anon a sigh seemed to rend her being with its intensity and she gazed into his face as though she would read his very soul. For many minutes thus they stood, neither speaking, each gazing—intently gazing—into the other's eyes.

"Yes," said the oculist, "one eye is seriously affected, and if not treated immediately, will develop a decided squint."—*St. Louis Star*

## INFANT MORTALITY IN RELATION TO BREAST FEEDING\*

By FLORENCE L. McKAY, M.D.

ALBANY N Y

### INTRODUCTION

*There is a belief in the superiority of breast feeding over artificial feeding, which is generally admitted by the medical profession as a whole. The interest in successful artificial feeding particularly among pediatricians, has tended to overshadow the advantages of breast feeding, although in recent years this has been to some extent counteracted by breast feeding propaganda. It is now generally conceded by all concerned that breast feeding reduces the mortality in infancy and lessens the morbidity by increased resistance to disease and an unimpaired general condition. What findings have we to substantiate these beliefs? What evidence has been brought forward to show that such conditions do result from breast feeding? The evidence available is not extensive and relates chiefly to breast feeding in relation to infant mortality.*

*Infant Mortality Reduction by Breast Feeding*—As long ago as the siege of Paris a report was written on the results of breast feeding. During this period, in Paris, mother's milk was the only sustenance available for infants. In spite of the distressing conditions under which mothers and children lived at that time the infant mortality rate was appreciably reduced, and this was apparently due to the fact that all infants were breastfed.

The incident of the little town of Villiers le Duc in France is an example of universal breast feeding in a limited area. The Mayor of this town, also a physician, evolved a system of universal breast feeding and from 1894 to 1903 the infant mortality figure was zero, and every child born during ten years was at the end of that period living and well.

It is stated that breast feeding has increased

during the past ten years in our country. The infant mortality rate has decreased from 124 to 86. It seems probable that there may be a direct relationship, although other factors resulting from child health activities along other lines should not be discounted.

Numerous studies have been made in other countries and certain investigations in infant mortality in relation to breast feeding have been made in the United States. Only the latter will be cited in this account.

In Boston in 1911 Dr W. A. Davis made a study of some two thousand infant deaths. In the period from 1910 to 1918 the Federal Children's Bureau made infant mortality investigations which included its relation to breast feeding. A report of the Minneapolis breast feeding demonstration includes its influence on the mortality rate. A resume of the results of artificial versus breast feeding in relation to infant mortality in our own country follows:

*First—Boston Study*—This study, made in 1911, included 2,248 babies who died between the ages of two weeks and one year. Of these babies who died 413 were breastfed and nearly three times that many, or 1,189, were bottlefed. It is estimated that if all had been breastfed there would have been a saving in that year of 995 lives and a reduction of the infant mortality rate from 127 to 71.

*Federal Children's Bureau Studies*—For most of our information concerning infant mortality rates in the United States we are indebted to the studies made by the Federal Children's Bureau in the following eight American cities: Johnstown, Pa., Manchester, N. H., Sagamore, Mich., New Bedford, Mass., Rockland, Mass., Waterbury, Conn., Akron, O., and Baltimore, Md., as reported in a monograph by Robert Woodbury. A total of 22,422 infants were studied according to type of feeding during each month of life in the first year as related to the infant mortality

(A more recent report in *Infant Mortality in Gary, Ind.*, shows similar statistics)

The feeding was divided into three types

First—Breastfed exclusively

Second—Partly breastfed

Third—Artificially fed exclusively

These studies show that the relative advantage of breast feeding is greater in the first nine months of life and when limited to this period that the mortality rate among the artificially fed is nearly five times as high as breastfed, and that the rate among the partially breastfed is nearly twice as high as among the breastfed. A table giving mortality and feeding by months (Woodbury Table No. 2) shows similarly that the mortality rate by each month of the artificially fed is from three to six times that of the breastfed, while that of the partially breastfed by months is two to three times that of the breastfed up to the eighth month.

Woodbury also makes a comparison between those who are exclusively breastfed to the end of the first year and those whose breast feeding ceased or was supplemented beginning with a specified month. The following paragraph is quoted from his report:

"The average monthly death rates from the second, third, fourth, fifth and sixth months to the end of the first year among infants whose breast feeding ceased or was supplemented beginning with these months were higher than the corresponding rates among infants who were exclusively breastfed to the end of the year. When the change from breast to partially or exclusively artificial feeding took place in the seventh month or after, however, the average monthly death rates were slightly less than the corresponding rates among infants who were breastfed up to the end of the year."

His studies also show that artificial feeding in the early months has a cumulative effect which appears in an excessively high mortality in the later months and that in each month of life the mortality rate was higher the longer the period of previous artificial feeding and lower the longer the period of previous breast feeding.

**Minneapolis Study**—Preceding the Minneapolis breast feeding demonstration the infant mortality rate had been 84 in 1911-1915, about 72 in 1915-1918 and during 1919, the first year of the demonstration, it dropped to 65.

The New York City Department of Health reports that in 1,065 infant deaths in three months of the summer of 1919, about 17 per cent occurred among the breastfed and about 27 per cent among the artificially fed.

**New York State**—In our Division of Maternity, Infancy and Child Hygiene we have recently made a survey of an upstate city with an infant mortality rate for a five-year period of 143.4. The infant deaths for 1921 were individ-

ually investigated and it was found that nearly 58 per cent of infants who died after the first week were artificially fed. Of these more than half were given proprietary foods. (In only 27 per cent of the artificially fed was the feeding prescribed by a physician.)

#### RELATION OF BREAST AND ARTIFICIAL FEEDING TO VARIOUS CAUSES OF DEATH

These studies above cited give us also some information concerning the relation of breast versus artificial feeding to the various causes of death. It would naturally be expected that the highest mortality rates among the artificially fed would be from gastro-intestinal causes. The Boston study shows that during July and August (the summer peak of infant deaths) while the death rate among the breastfed was slightly increased, that among the artificially fed was trebled. For this cause, that is, gastro-enteritis, the Children's Bureau study shows a mortality rate in the second to the ninth month in the artificially fed more than eleven times as great as among those breastfed over this period. Similarly in all causes of death the rates among the artificially fed are decidedly in excess of the breastfed. Respiratory diseases, for example, are 80 per cent higher among the artificially fed.

**Infant Mortality in Relation to Morbidity**—With these facts as to mortality before us, what of morbidity? A breastfed infant is generally supposed to make a better gain in weight than the artificially fed and we have clinical evidence that there is a greater resistance to infection and usually a better recovery, and that breast milk is practically necessary to the survival of feeble infants. Figures supporting these suppositions are meagre. The preceding statistics showing a much higher respiratory disease death rate among the artificially fed indicate that breast feeding may afford protection against or a resistance to respiratory infections. We have also the St. Louis report by Dr. Adrien Blyer on the "Normal Deterioration of Infants of the Poor as Related to Breast Feeding." These figures relate to children in infant welfare stations studied in the year 1910 when 67 per cent were breastfed, and again in 1920 when 93 per cent were breastfed. The deviation from the normal weight curve is taken as an indication of deterioration and the study shows that when there was only 67 per cent breast feeding there is a marked deviation below normal beginning in the first month and continuing throughout the first year. In the 93 per cent group there is no deviation from normal in the first two months and only a comparatively small degree through the remainder of the year.

The Indiana Department of Health which conducts child health examinations reports that 65 per cent of children in the underweight class had

not been breastfed, and that "the percentage of breast feeding in any community seemed to depend upon the advice given by the physician as to its advisability"
